5. In an electric clock, the combination with a pendulum crutch or fork provided with oppositely-arranged arms, of a pivoted and weighted arm adapted to strike one arm of the pendulum crutch or fork and provided with an angular extension, an electromagnet, a circuit-closer con-

trolled by the other arm of the pendulum crutch or fork, a pivoted lever, having one end connected with the armature of the magnet and its other end engaging the extension of the weighted arm, a pivoted and spring-pressed arm provided with a lag with which the weighted arm engages when raised, and means for swinging the spring-pressed arm against the action of its spring from the pendulum crutch or fork, as set forth.

6. In an electric clock, the combination with a pendulum crutch or fork provided with oppositely-arranged arms and with an extension at its upper end, of a pivoted and weighted lever adapted to strike one of the arms of the pendulum crutch or fork and provided with an angular extension, an electromagnet, a circuit-closer controlled by the other arm of the pendulum crutch or fork, a pivoted lever having one end engaging the angular extension of the weighted lever, a link connecting the other end of the lever with the armature of the magnet, and a pivoted and spring-pressed arm provided with a lag with which the weighted arm engages when raised, and with an angular extension extending into the path of the extension of the pendulum crutch or fork, as set forth.

7. In an electric clock, the combination with a pendulum crutch or fork provided with oppositely-arranged arms, one of which is provided with a lateral projection, of a pivoted and weighted lever adapted to strike one arm of the pendulum crutch or fork, an electromagnet, means for swinging the weighted arm in an upward position, means for holding the weighted arm raised, means controlled from the pendulum crutch or fork for releasing the weighted arm, a pivoted arm provided with an upwardly-projecting contact-point adapted to be engaged by the projection on the arm of the pendulum crutch or fork, a contact-plate above the contact of the said arm, and an electric circuit, as set forth.

698,986. CAR-REPLACER. ALBERT J. HANSEN, Sweden, Pa. Filed Oct. 18, 1901. Serial No. 73,155. (No model.)

Claim.—1. In a device of the character described, a frog having a continuous lateral head or tread extending inwardly toward one end, also inclining upwardly and forwardly at its opposite end, said head being straight the remainder of its length, and said frog having its upper surface inclined downwardly toward its longitudinal center, substantially as set forth.

2. In a device of the character described, a frog having a rail-receiving slot in its under side, and having a continuous lateral head or tread extending inwardly toward one end, also inclining upwardly and forwardly at its opposite end, said head being straight the remainder of its length, and terminating at one end in the plane of said slot, and said frog having its upper surface inclined downwardly toward its longitudinal center, substantially as set forth.

3. In a device of the character described, a frog having a continuous lateral head or tread extending inwardly toward one end, also inclining upwardly and forwardly at its opposite end, said head being straight the remainder of its length, said frog also having an opposite lateral edge portion also extending inwardly toward the first-referred-to end of the frog, the upper surface of said frog being inclined downwardly toward its longitudinal center, substantially as set forth.

4. In a device of the character described, a frog having a continuous lateral head or tread extending inwardly toward one end, also inclining upwardly and forwardly at its opposite end, said head being straight the remainder of its length, said frog also having an opposite lateral edge extending inwardly and forwardly toward the first-referred-to end of the frog, the upper surface of said frog being inclined downwardly toward the longitudinal center thereof also longitudinally, substantially as set forth.

5. In a device of the character described, a frog having a continuous lateral head or tread extending inwardly toward one end, also inclining upwardly and forwardly at its opposite end, said head being straight the remainder of its length, said frog also having an opposite lateral edge also extending inwardly toward the first-referred-to end of the frog, and having an upper surface inclined transversely downwardly toward its longitudinal center, also longitudinally, and additional treads or ribs arranged upon said upper surface, as or near the rear end, substantially as set forth.

6. In a device of the character described, a frog having a continuous lateral head or tread extending inwardly toward one end, also inclining

upwardly and forwardly at its opposite end, said head being straight the remainder of its length, said frog having a rail-receiving slot and an opposite lateral edge also extending inwardly toward the first-referred-to end of the frog, and having an upper surface inclined transversely downwardly toward its longitudinal center, and longitudinally, said additional track or rib arranged upon said upper surface, at or near the rear end, substantially as set forth.

698,987. HOLDER FOR DUST-PANS, BROOMS, AND DUST-BRUSHES. JOHN H. MILLER, Crestline, Kans. Filed Feb. 12, 1902. Serial No. 94,787. (No model.)

Claim.—1. A holder for dust-pans, brooms, dust-brushes or the like, comprising a wire rod bent to form two spaced spring-coils and depending members extended from said coils, portions of said members being bent in opposite directions and having a hook formed on each free end.

2. A holder for dust-pans, brooms and dust-brushes, comprising a back board, and a holder device consisting of a single wire rod, bent at the center into a loop having side members which merge into two oppositely-curved spring-coils, depending members extended from the coils, aligned horizontal members, bent oppositely, on the lower ends of the depending members, hooks turned outward and upward on the horizontal members at their free ends, and means for securing the holder device upon the back board.

698,988. VENTILATOR FOR FIRE-SURFACES OF RANGES. ARTHUR E. HENK, Brooklyn, N. Y. Filed May 12, 1901. Serial No. 60,332. (No model.)

Claim.—1. A ventilator for the fire-surfaces of stoves and ranges, consisting of a base-section open at its top and bottom and having an opening at one end, doors normally closing said opening, apertures at the opposite end and above the other, and a shelf below each aperture, the shelves being adapted to support one end of a broiler and the apertures to receive a pin at the said end of the broiler and which is of a length to permit the broiler to be rotated after it is moved from the shelf, and an arched cover for the base, said cover being provided with a series of apertures on each side of its longitudinal center and downwardly-curved heads secured to said cover over said apertures, the lower portions of which heads are open though otherwise closed, as described.

2. The combination, with a base-section open at its top and bottom and provided at one end with an opening, doors normally closing said opening, the opposite end of the base being provided with interior shelves one above the other and an aperture above each shelf, and a broiler adapted to rest at its hinged end upon one of the shelves and provided with a pin at said hinged end adapted to enter either one of the said apertures and of a length to allow the broiler to be rotated after its end is moved from the shelf, the handle of the broiler being adapted to extend through the opening normally closed by the doors, of an arched cover-section provided with a series of openings in its upper portion on each side of its longitudinal center, and downwardly-curved heads extending over the said openings at the exterior of the body of the cover-section, which heads are open at their lower portions though otherwise closed, and means for removably supporting the cover-section on the base-section, as set forth.

698,989. CAR-WINDOW. ALEXANDER HOFFER, Chiklawa, Pa. Filed July 25, 1901. Serial No. 68,662. (No model.)

Claim.—1. The combination of a casing, an outwardly-movable window therein, and window-securing device mounted in the casing at opposite sides of the window between the upper and lower ends of the latter and adapted to overlap the outer face of the window, whereby the window may be released at either vertical edge with the securing device at the opposite edge serving as a hinge, substantially as shown and described.

2. The combination of a casing, an outwardly-movable window therein having its opposite vertical edges rounded, movable securing devices on the outer side of the casing at opposite sides of the window and adapted to overlap the said rounded vertical edges thereof, whereby the window may be released and moved outward at either vertical edge with its opposite rounded edge and the securing devices overlapping the same and coacting to form a hinge, substantially as shown and described.

3. The combination of a casing, an outwardly-movable window therein having its opposite vertical edges rounded, rotatable heads concentrically mounted on the outer side of the casing at opposite sides of the window and adapted to overlap the said rounded vertical edges thereof, whereby the window may be released and moved outward at either vertical edge with its opposite rounded edge and the heads overlapping the same coacting to form a hinge, substantially as shown and described.

4. The combination of a casing, an outwardly-movable window fitted therein, shafts mounted transversely in the casing at opposite sides of the window, an operative connection between shafts at each side of the window whereby they are caused to turn together, and window-securing devices mounted on the shafts and operated thereby, substantially as shown and described.

5. The combination of a casing, an outwardly-movable window fitted therein, two window-securing devices operatively mounted in the casing at each side of the window, and a connection between said devices, whereby they are caused to operate together, substantially as shown and described.

6. The combination of a casing having a window-opening, an outwardly-projecting horizontal ledge both above and below the opening, an outwardly-movable window fitted in the opening, and securing devices operatively mounted in the casing and adapted to overlap the vertical edges thereof, substantially as shown and described.

7. The combination of a casing, a mesh, metallic strips secured to the vertical edges of the mesh, said strips having outward projections, and locking devices adapted to removably engage the strip projections, substantially as shown and described.

8. The combination of a casing, the window-mesh, metallic strips secured to the vertical side edges of the mesh, the outer edges of said strips having outwardly-rounded projections and locking devices mounted in the casing and adapted to removably engage the rounded portions of the metallic strips, substantially as shown and described.

9. The combination of a casing, a window-mesh T-shaped metallic strips secured to the opposite vertical edges of the mesh, the outwardly-projecting head portions of said strips being rounded, and heads concentrically mounted in the casing and adapted normally to overlap said rounded strip-heads, substantially as shown and described.

10. The combination of a casing, an outwardly-movable window fitted therein, the shafts mounted transversely in the casing, the shafts on each side of the casing being operatively connected for causing the same to turn in unison, window-securing devices carried by the shafts, and a spring for maintaining said devices normally in operative position, substantially as shown and described.

698,990. CRUMPER. ALEXANDER G. HOFFER, Tyngs, Pa. Filed Feb. 28, 1902. Serial No. 61,678. (No model.)

Claim.—1. A crumpler having a frame, a stationary jaw, a removable wear-plate fitted therein, a clamp holding the wear-plate in position, and a belt engaging the clamp and passing into operation with the frame of the machine to hold the clamp and the jaw both rigidly in place.

2. A crumpler having a frame, a stationary jaw provided at its upper portion with a lateral projection set into a cavity in the frame, a belt

passing through said projection of the jaw and engaging the jaw and frame to hold the former in position, said belt being capable of slight sliding movement in the frame to allow the jaw to swing, and a fastenable spacer set against the lower portion of the jaw, for the purpose specified.

3. A crumpler, comprising a frame, divergently-movable jaws swinging on a common axis, division-plates hung from said axis and abutment between the jaws, means for moving the jaws, and means connected to the frame and division-plates to hold the plates stationary.

4. A crumpler having a frame, a stationary jaw, means for holding the upper end of the jaw on the frame, each means permitting the jaw a slight swinging movement, and a fastenable spacer set between the lower part of the jaw and the frame.

698,991. CHAIN-WHEEL. FRANK L. MOORE, Trumbull, N. Y. Filed Apr. 12, 1901. Serial No. 55,977. (No model.)

Claim.—1. A chain-wheel having grooves extending transversely across the entire periphery of the wheel thereby having sprocket-teeth extending from side to side of the wheel, said teeth having guiding-flanges at their ends whereby the chain may be retained on the teeth.

2. A chain-wheel having a groove about its periphery having projecting ridges at the sides thereof and transverse channels extending from side to side of the wheel and sunk below the bottom of said groove thereby having teeth with outwardly-extending projections at their ends substantially as set forth.

698,992. CLOTHING-LINE FASTENER. JOHN B. MILLER, New York, N. Y. Filed July 25, 1901. Serial No. 68,595. (No model.)

Claim.—1. A grip or line-fastener comprising a handle having a shoulder and a loop and a catch, and a line having one end secured to the loop and the other end engaged by the catch and passed through the loop, the free end of the line being passed between each other end and the shoulder substantially as described.

2. A grip or line-fastener comprising a handle having a shoulder and an adjustable line-engaging loop and a catch portion, said shoulder and catch portion being adapted for engagement by an end of the line and said loop and catch being adjustable within the shoulder-portion.

3. A grip or line-fastener comprising a shoulder-portion with an adjustable line-engaging loop and catch portion, said shoulder-portion being

perforated for allowing the line to be passed therethrough and through the loop substantially as described.

698,993. TRANSPORTABLE DEVICE FOR DRAWING CONSTANT QUANTITIES OF LIQUIDS OF VARYING DENSITY. AUGUST HENNINGSEN, Berlin, Germany. Filed July 2, 1901. Serial No. 64,896. (No model.)

Claim.—1. In a device for drawing constant quantities of liquid of varying density from a suitable liquid-containing vessel, the combination of a float guided in the liquid-containing vessel, a siphon provided at one end of said float, means in said float for counterbalancing the siphon, and interchangeable caps for said siphon, substantially as set forth.

2. In a device for drawing constant quantities of liquid of varying density from a suitable liquid-containing vessel, the combination of guide-rods arranged in said liquid-containing vessel, a float guided by the same, a siphon provided at one end of said float, interchangeable caps for said siphon, counterbalancing-weights provided in said float, and means for balancing said float, substantially as set forth.

3. In a device for drawing constant quantities of liquid of varying density from a suitable liquid-containing vessel, the combination of a float arranged in said liquid-containing vessel, upright rods for guiding the same, guide-arms on opposite sides of said float for engaging said guide-rods, a siphon having one arm extending through said float at one end thereof, the outer arm of said siphon being arranged anteriorly of said liquid-containing vessel, interchangeable caps provided for the outer end of the siphon, means for counterbalancing the weight of the siphon, and a slidable weight for balancing said float, substantially as set forth.

698,994. MEANS FOR CUTTING CLOTH, LEATHER, &c. ROBERT E. HENNINGSEN and GEORGE A. BARNES, Boston, England. Filed Oct. 12, 1901. Serial No. 72,764. (No model.)

Claim.—1. In a machine of the class described, a spindle having cutting means, a table over which the material travels, a disk plate for receiving said table, threaded spindles depending from said table, internally-threaded gears for receiving said spindles, means for holding the gears against motion in the direction of the lengths of said spindles, a second series of gears meshing with the other gears, and means for operating said second series of gears in unison.

2. In a machine of the class described, a spindle having adjustable cutters, a table having depending threaded spindles, internally-threaded, bevel-gears for receiving said spindles, a second set of bevel-gears meshing with the first-mentioned bevel-gears, a shaft carrying said second series of bevel-gears, said shaft having a gear, a second shaft having a gear meshing with said last-mentioned gear, a manually-operable device on said second shaft, and means for holding the first-mentioned bevel-gears against movement in the direction of the lengths of said threaded spindles.

3. In a machine of the class described, a batch-roller, a receiving-roller, a spindle between said rollers, having cutting means, and a lever carrying a weight-receiving trough arranged to bear against the material as it passes from one roller onto the other.

698,995. DAMPER. ROGER H. HUGHART, Des Moines, Iowa. Filed July 12, 1901. Serial No. 61,595. (No model.)

Claim.—1. In a stovepipe-damper, a ring provided with an inwardly-projecting head and a slot in line with said head in the ring, in combination with a strip adapted to fit said slot and project within the inner periphery of the ring, the lower edges of the strip and the said head forming shoulders for the meeting edges of two pipe-sections, and bracing formed in the said ring and strip for a damper.

2. In a stovepipe-damper, a ring provided with an inwardly-projecting head extending substantially half-way around the ring and a slot in line with said head in the other half of the ring, in combination with a substantially semi-circular strip adapted to fit said slot and project within the inner periphery of the ring to form the complement of the said head, the ring and strip being constructed as to form bearings for a damper.

698,996. CULTIVATOR. JAMES A. McHUGH, Mount Lebanon, W. Va. Filed Feb. 7, 1902. Serial No. 64,002. (No model.)

Claim.—1. In combination, a draft-beam having a longitudinal slot and the portion at the lower side of the slot widened laterally, a swing-beam pivotedly mounted in the said slot and provided at its ends with cultivator-shovels, and means for holding the swing-beam in the required position, substantially as set forth.

2. In combination, a draft-beam, a cross-bar, a swing-beam provided with cultivator-shovels, and catches for securing the swing-beam to either end of the cross-bar, substantially as set forth.

3. In combination, a draft-beam, a cross-bar, a swing-beam provided with cultivator-shovels and having its outer end bent, and catches applied to the ends of the cross-bar to engage with the bent ends of the swing-beam to hold it in an adjusted position, substantially as set forth.

4. A cultivator comprising a draft-beam, front and rear cross-bars, handles supported by means of the cross-bars, a swing-beam pivoted to

the draft-beam and provided with cultivator-shovels, and catches at the ends of the rear cross-bar to engage with either end of the swing-beam for holding it in the required position, substantially as specified.

698,997. DENTAL INSTRUMENT. JAMES W. McCORMACK, Germantown, Pa. Filed Feb. 2, 1901. Renewed Dec. 17, 1901. Serial No. 64,001. (No model.)

Claim.—1. An amalgam-cutter consisting of a dental instrument having a piece of silver mounted thereon, and a silver-amalgam tooling on said piece of silver, as set forth.

2. An amalgam-cutter consisting of a dental instrument having a beveled piece of silver mounted thereon, and a silver-amalgam coating on said piece of silver, as set forth.

698,998. HAY-LOADER. WILLIAM HOLLAND, Seattle, Wa. Filed June 11, 1901. Serial No. 61,511. (No model.)

Claim.—1. In a hay-loader, the combination of an elevator comprising an endless belt of rubber-teeth mounted upon a suitable carrying-frame, inclined guide-bars supported from said frame, and stationary teeth secured to and near the lower ends of said guide-bars, and resting upon the surface of the ground at their free ends, substantially as set forth.

2. In a hay-loader, the combination of an elevator comprising an endless belt of rubber-teeth mounted upon a suitable carrying-frame, inclined guide-bars supported from said frame, stationary rubber-teeth secured to and near the lower ends of said guide-bars, and resting upon the surface of the ground at their free ends, and an endless belt of teeth adapted to move at right angles to the line of travel of the first-mentioned belt of rubber-teeth, substantially as set forth.

3. In a machine of the character described, the combination of an elevator comprising a belt of rubber-teeth mounted upon a suitable carrying-frame, and a belt of rubber-teeth adapted to move at right angles to the line of travel of said elevator, the latter belt of rubber-teeth being suspended laterally from the frame of said elevator, substantially as set forth.

4. In a machine of the character described, the combination of an elevator comprising a belt of rubber-teeth mounted upon a suitable carrying-frame, belts of rubber-teeth adapted to move at right angles to the line of travel of said elevator, with their carrying-frames suspended laterally from the carrying-frame of said elevator and stationary rubber-teeth fixed to the lower ends of said guide-bars, substantially as set forth.

5. In a machine of the character described, the combination of an elevator comprising a belt of rubber-teeth, guide-bars supported from the carrying-frame of said belt of rubber-teeth, stationary rubber-teeth fixed to the lower ends of said guide-bars, belts of rubber-teeth adapted to move at right angles to the line of travel of said elevator, with their carrying-

frames arranged laterally of the first-mentioned frame, the lower ends of said last-mentioned frames being supported directly from the first-mentioned frame and the outer ends of said last-mentioned frames having red connection with the first-mentioned frame, substantially as set forth.

698,999. SHADE FOR PHOTOGRAPHIC LENS. FRANK W. NICHOLSON, Jackson, Mich. Filed Feb. 15, 1901. Serial No. 61,479. (No model.)

Claim.—1. A lens-shade for camera consisting of a single piece of yielding material including depending arms whereby the shade may be sprung into engagement therewith, and each of said arms being provided with an offsetting projection adapted to bear against the camera.

2. A lens-shade for camera consisting of a single piece of yielding material including depending arms whereby the shade may be sprung into engagement therewith, and each of the said arms provided with an offsetting projection adapted to bear against the camera, one of said arms arranged to overlap the other at its free end and when the shade is in operative position.

3. A lens-shade consisting of a plate provided with yielding extensions for engagement with a camera or the like; a second plate detachably and slidably mounted upon the first-mentioned plate.

4. A lens-shade consisting of a plate having yielding extensions for engagement with a camera or the like; a second plate disposed upon the first-mentioned plate; grooves upon the edges of one plate adapted to receive the edges of the other plate whereby one of the plates may have a sliding movement with relation to the other; and means for limiting the sliding movement of the sliding plate.

5. A lens-shade consisting of a plate provided with yielding extensions for engagement with a camera or the like; a second plate slidably and detachably mounted upon the first-mentioned plate; and means for limiting the sliding movement of the second plate.

6. A lens-shade consisting of a single piece of metal bent in the form of an arc of a circle having yielding extensions adapted to engage a camera or the like; a second curved plate bent to form the arc of a circle and detachably and slidably mounted upon the first-mentioned plate.

7. A new article of manufacture, a lens-shade provided with spring members whereby the shade may be sprung into engagement with the lens-holder of a camera or the like, the shade having an extension adjustable longitudinally thereon.

8. A new article of manufacture, a lens-shade provided with gripping members for detachably securing the shade to a camera or the like, the shade provided with an adjustable sliding extension.

9. In a device of the class described, a photographic lens-shade consisting of a curved plate of a shape similar to a section of a hollow cylinder, having arms adapted to engage the lens, support, and having lugs to bear against said support; a second plate of a shape similar to said first-mentioned plate, grooves at the edges of one plate adapted to receive the edges of the other plate, and for said other plate to engage therewith, and to slide forward and backward thereon; a tongue upon one plate in spring contact with the other plate, and adapted to engage an opening in said other plate; a scale upon one plate to indicate the position of said other plate with reference thereto.

10. In a device of the class described, a shade for photographic or other lenses consisting of a curved plate of a shape similar to a section of a hollow cylinder, having arms adapted to engage the lens, support, and having lugs to bear against said support; a second plate of a shape similar to said first-mentioned plate, grooves at the edges of one plate adapted to receive the edges of the other plate, and for said other plate to engage therewith, and to slide forward and backward thereon; a tongue upon one plate in spring contact with the other plate, and adapted to engage an opening in said other plate; a scale upon one plate to indicate the position of said other plate with reference thereto.

699,000. HOISTING-BUCKET. ALBERT E. BROWN, Cambridge, and JAMES BROWN, Boston, Mass., assignors to BROWN & BROWN HOISTING COMPANY, Cambridge, Mass. Filed Dec. 2, 1901. Serial No. 61,505. (No model.)

Claim.—1. In a hoisting-bucket, two bucket-eyes, a plurality of chains carried thereby, a head carrying one or more sheaves, an open-

ing and closing chain passing about said sheaves, and an arm rigid with the head and to which the end of the said chain is attached, said arm extending radially from the axial line of the sheaves in the head and being substantially in alignment with that portion of the chain connected thereto.

2. In a hoisting-bucket, a head carrying one or more sheaves, an opening and closing chain passing about said sheaves and an arm rigid with the head and to which the end of the opening and closing chain is attached, said arm extending radially from the axial line of the sheaves and being substantially in alignment with that portion of the chain connected thereto.

3. In a hoisting-bucket, two bucket-eyes, a series of sheaves carried thereby, a head having an arm rigidly secured thereto, and an opening and closing chain passing around the sheaves on the bucket-eyes and having the end thereof secured to the said arm, said arm being in line with that portion of the chain connected thereto and substantially vertically over the last sheave of the series.

4. In a hoisting-bucket, a head having an arm integral therewith and projecting therefrom to which the end of the opening and closing chain is attached, said arm being attached in the plane of the side of the head and being inclined to the vertical whereby the pull upon the opening and closing chain is in the direction of the length of the arm, and curves to maintain the head in a vertical position.

5. A hoisting-bucket comprising two bucket-eyes, a head, connections between the head and eyes, and an opening and closing chain, said head having a laterally-extended guide-eye provided with a chain-receiving opening and a leader, detachably secured to said guide-eye, said leader having an aperture to fit the chain.

6. A hoisting-bucket comprising two bucket-eyes, a head, connections between the head and eyes, and an opening and closing chain, said head having rigid therewith an offset guide-eye through which the said chain passes, a leader surrounding the chain and detachably secured to the guide-eye, and a downwardly-extended arm to which one end of said chain is secured, said arm also being rigid with the head and being in the plane of the end thereof.

7. A hoisting-bucket comprising two bucket-eyes pivotally connected together, a head, links connecting the head and eyes, and an opening and closing chain, said head having an offset guide-eye provided with a detachable leader through which the said chain passes, and an integral downwardly-extended arm to which one end of the chain is attached, said arm being inclined to the vertical whereby the pull on the chain curves to maintain said head in a vertical position.

8. In a hoisting-bucket, a head having an offset guide-eye adapted to receive the opening and closing chain, and a one-piece leader surrounding the chain and detachably secured to said guide-eye, said leader serving to protect the guide-eye from wear.

9. In a hoisting-bucket, a head having an offset guide-eye, provided with an aperture adapted to receive the opening and closing chain, said aperture being larger than said chain, and a detachable leader attached to the guide-eye and having an aperture adapted to fit the chain, whereby the leader prevents the chain from twisting and protects the guide-eye from wear.

10. A hoisting-bucket comprising two pivotally-connected bucket-eyes, a head, links pivotally connecting said head and bucket-eyes, and an opening and closing chain, sheaves carried by said head and over which said chain passes, a pin supporting said sheaves and projecting at its ends beyond the end faces of said head, and projecting lugs on said head which partially enclose said projecting ends of the pin, whereby the said pin ends are protected from injury from blows.

11. In a hoisting-basket, a head for supporting the sheaves over which the opening and closing chain runs, a pivot-pin on which said sheaves turn, said pivot-pin having an off-set at one end, and means to convey the oil to the portion on which the sheaves bear, and said head having projecting legs situated at either side of said off-set, whereby said off-set is protected against injury.

12. In a hoisting-basket, a head for supporting the sheaves over which the opening and closing chain runs, a pivot-pin on which said sheaves turn, said pivot-pin having a laterally-disposed off-set at one end, and means to convey the oil to the portion on which the sheaves bear, said head having projecting legs situated at either side of said off-set, whereby said off-set is protected against injury.

13. In a hoisting-basket, two basket-segments pivoted together, a head and links connecting the head and basket-segments, each segment comprising a bottom and two side pieces, and a tie member, said tie member having an inwardly-disposed offset portion at each end, a leg projecting from said offset to which the link is pivoted, and arms for securing said tie member to the side pieces, the leg on the offset portion coming substantially flush with the outside edge of said tie member, whereby the pivoted connections of said legs and links do not project outside of the basket-segments.

14. In a hoisting-basket, two basket-segments, a rod or shaft on which said segments are pivotally mounted, a head, links connecting said head and basket-segments, sheaves carried by said shaft, an opening and closing chain connected to said head and passing around said sheaves, and a weight secured on said rod, said weight having a cut-away portion in which said sheaves operate, and enlarged bosses at either side of said cut-away portion, said bosses being approximately the size of the sheaves.

15. In a hoisting-basket, two basket-segments, a rod or shaft on which said segments are pivotally mounted, a head, links connecting said head and basket-segments, sheaves carried by said shaft, an opening and closing chain connected to said head and passing around said sheaves, and a weight secured on said rod, said weight having a cut-away portion in which said sheaves operate, and enlarged bosses at either side of said cut-away portion, said bosses being approximately the size of the sheaves, and all members or passages contained in said bosses.

16. In a hoisting-basket, two basket-segments, arms secured to the upper portions of said segments and having at their inner ends upwardly-disposed offset, a pivot-shaft extending through said offset ends of the arms whereby the two basket-segments are pivotally connected together, sheaves supported on said shaft, a head having an offset guide-eye, an opening and closing chain connected to said head and passing through the eye and over said sheaves, and a leader detachably secured to the mid eye, said leader having an aperture to fit the chain.

17. In a hoisting-basket, two pivotally-connected basket-segments having overlapping lips, a head, links pivotally connecting the head with the basket-segments, a hoisting-chain connected in the head and passing around the pivotal point between the basket-segments, the said head having a laterally-disposed guide-eye through which the chain passes, and a leader surrounding said chain and detachably secured to said guide-eye, said leader having an aperture to fit the chain.

18. In a hoisting-basket, two basket-segments, arms connected to the upper sides of each segment and having upwardly-disposed portions, the arms of one segment being pivotally connected to the arms of the other segment, and each segment having a jaw running completely around the inner edge thereof, the ends of said jaws overlapping and being secured to the upwardly-disposed portions of said arms.

19. A basket-segment, having its sides and bottom connected by a curved portion of progressively-increased radius from the back of the segment to the mouth thereof.

20. A basket-segment having its sides and bottom connected by a curved portion of progressively-increased radius from the back of the segment to the mouth thereof, and having a thickened jaw running completely around the mouth on the outside of its shell.

21. A basket-segment having arms connected to the upper sides thereof, each arm having an upwardly-disposed portion provided with a hooked aperture, for connecting said segment to a pivot-shaft, the said segment having a thickened hooked jaw extending vertically around the mouth thereof and on the outside of its shell, the sides and bottom segments of said basket being connected by a curved portion of progressively-increased radius from the back of the segment to the mouth thereof.

699,001. HOISTING MACHINE. GEORGE R. HENRI, Detroit, Mich. Filed Sept. 26, 1901. Serial No. 74,908. (No model.)

Claim.—In an edge-loading machine, the combination of one edge-loader, means for holding them in position and preventing their partial rotation against the resistance of a spring, a platform upon which the articles to be loaded are carried, means for forcing the articles between the

ends, and an elastic tongue M to assist in holding the articles in position and to afford a guide therefor, substantially as described.

699,002. CAGE. EDGAR A. HENRI, Utica, N. Y. Filed June 4, 1901. Serial No. 69,674. (No model.)

Claim.—1. A cage having its upper or open end tapered inward, a cover having a flange tapered outward, the space between the tapered end and the flange being equal from the top to the bottom of the flange, and a packing string or cord adapted to wind around the tapered portion of the body and having one end extended outward whereby the cord may be drawn out to release the cover, substantially as specified.

2. A cage, a cover therefor, a collar for extending around the end, side plates of spring material transversely curved and pivotally connected to said collar, a yoke pivoted to the lower ends of the side plates and adapted to be turned over the bottom of the cage, substantially as specified.

3. A cage, a cover therefor, a collar for engaging around the end, the said collar having one of its ends free and extended underneath the body portion of the cage, side plates pivoted to said collar, a yoke pivoted to the side plates and adapted to engage with the cover, and a ball of spring material attached to the lower ends of the side plates, substantially as specified.

699,003. CENTRIFUGAL MACHINE. STAP GILMAN, Utica, N. Y. Filed Sept. 24, 1901. Serial No. 74,904. (No model.)

Claim.—1. The combination with a drum, having a tubular center and a bearing-piece therein provided with a recessed seat in its under side, of an upright driving-shaft extending up into said center, said shaft being of less diameter than the bore in said center and said drum being free to move laterally in all directions with respect to said shaft, and a single separate intermediate part between a nut on the shaft and the recessed seat in said bearing-piece, said intermediate part being free to move laterally in all directions with respect to the lateral movements of the drum.

2. The combination with a drum, having a tubular center and a bearing-piece therein, of an upright driving-shaft extending up into said center, said shaft being of less diameter than the bore in said center and said drum being free to move laterally in all directions with respect to said shaft, a single intermediate block between a flat nut on the shaft and a nut in the bearing-piece, said block being flat on its under side or face and free to move laterally in all directions with respect to the lateral movement of the drum.

3. The combination with a drum, having a tubular center and a bearing-piece with a concave seat, of a shaft having a less diameter than the bore of the center and extending into said bore, and having a flat nut at its upper end, and the intermediate block 3, having a flat under side where it rests on the shaft, and a rounded upper surface fitting the seat in the bearing-piece.

4. The combination with an upright, rotatable shaft, a single intermediate piece mounted on a bearing on said shaft and movable independently of the latter, and a drum supported centrally on said intermediate piece and movable laterally in all directions about said shaft, the latter rotating the drum through the medium of the said intermediate supporting-piece, substantially as set forth.

699,004. SAND-WHEELING MACHINE. CHARLES F. O'NEIL, Paterson, N. J. Filed Dec. 21, 1901. Serial No. 77,045. (No model.)

Claim.—1. In combination, with a vehicle-frame, a hopper arranged on said frame and having a discharge-opening in the lower portion thereof, the lower walls of said hopper being inclined toward said opening, a rotary receptacle arranged under said opening, a stationary flange interposed between the hopper and said receptacle and projecting into them at its ends, means for securing said receptacle detachably to the frame, and means for rotating said receptacle, substantially as described.

2. In a distributing mechanism for standing-machines, the combination of a vehicle-frame, a rotary box or chamber, means for supporting said box or chamber in the frame, a removable plug having its top or inner end of conical form constituting the lower wall of said chamber, and discharge-openings projecting laterally from said box or chamber immediately above said plug, substantially as described.

3. The combination of a vehicle-frame, a hopper arranged on said frame and having an opening in its bottom portion, the bottom walls of said hopper being inclined toward said opening, a pyramidal guard arranged over said opening and spaced from said hopper at its sides thereof, a rotary receptacle arranged in said frame under said opening and having lateral discharge-openings, a shaft rotatable with said receptacle and projecting up into said hopper, a bracket carried by said shaft at spaced points substantially throughout the length of said shaft, and means for rotating said receptacle, substantially as described.

4. The combination of a vehicle-frame, a hopper arranged on said frame and having an opening in its bottom portion, a rotary receptacle arranged in said frame under the opening of the hopper and having lateral discharge-openings, a sleeve surrounding said receptacle, a flange interposed between said sleeve and the hopper and projecting into said sleeve and the opening in said hopper, a shaft rotatable with said receptacle and projecting up into the hopper through said sleeve and flange, and laterally-projecting members for said receptacle communicating with the openings therein, substantially as described.

699,005. VEHICLE-WHEEL. GEORGE E. STUART, London, Mich. Filed Oct. 2, 1901. Serial No. 77,041. (No model.)

Claim.—1. A vehicle-hub, constructed with an outwardly-projecting annular head forming an interior annular lubricating-chamber in the inner wall of the hub, said wall flared outwardly adjacent to said chamber to increase the capacity of the chamber.

2. A vehicle-hub constructed with an outwardly-projecting flange intermediate of the ends thereof and with an outwardly-projecting head, said hub having in combination therewith a laterally-movable outwardly-projecting band intermediate of the ends thereof resting on said head and spokes having their inner ends engaged between said flange and said hub.

3. A vehicle-hub constructed with a stationary outwardly-projecting flange intermediate of the ends thereof and with an outwardly-projecting head said hub having in combination therewith a laterally-movable outwardly-projecting band intermediate of the ends thereof resting upon said head, and spokes having their inner ends engaged between said flange and said head, and both ending said flange and head whereby the movable band may be tightened against the inner ends of the spokes to take up any looseness in the engagement of the spokes with the hub.

4. A vehicle-hub constructed with a stationary outwardly-projecting flange intermediate of the ends thereof, and with an outwardly-projecting head intermediate of the ends of the hub, a movable outwardly-projecting band resting upon said head, spokes having their inner ends engaged between said head and said flange, and both passed through said flange and head, whereby the movable band may be tightened against the adjacent ends of the spokes.

5. A vehicle-hub constructed with a stationary flange intermediate of the ends thereof, and with an outwardly-projecting head, said hub having in combination therewith a movable band intermediate of the ends thereof resting upon said head, spokes, wedge-shaped at their inner ends, engaged between said flange and head, both passed through each of said spokes and through said flange and head, and ends upon said head whereby the movable band may be tightened against said spokes, said head forming an interior lubricating-chamber.

699,006. CARTING-FLANK. CHARLES A. PALMER, Chicago, Ill. Filed June 8, 1900. Serial No. 19,115. (No model.)

Claim.—1. A carting-flank of the class described, comprising three separate sections, to wit, a cope having a substantially flat parting face and a drag fitting said cope, comprising two separable sections having curved abutting inner walls shaped to conform to the curved outline of the model, substantially as described.

2. A carting-flank of the class described, comprising three separate sections, to wit, a cope having a substantially flat parting face and a drag fitting said cope, comprising two separable sections having curved abutting inner walls depressed or cut away below the plane of the parting

face and shaped to conform to the curved outline of the model, substantially as described.

3. A casting-flask for undercut models or patterns, consisting of three sections, to wit, a cope *C* having a substantially flat parting face and a drag fitting said cope comprising two sections *A* and *B*, the outer and inner walls of the section *B* having the general form of concentric arcs of circles and the section *A* having an outer wall conforming substantially to the adjacent portion of the cope, said section *A* removably fitting upon section *B*, whereby a parting is secured conforming to said curved inner walls, substantially as described.

4. A dental casting-flask comprising three separable flask-sections, of which the cope *C* is separable from the other sections along a horizontal plane, and sections *A* and *B* for receiving the sectional sand mold, are separable from each other substantially at right angles with said plane, along a curved line conforming to the exterior outline of the dental model, said sections *A* and *B* being provided with a supporting-wall for the sectional sand mold, conforming likewise to the exterior outline of the dental model, substantially as described.

5. In a casting-flask, the combination with flask-section *C*, of sections *A* and *B* wherein a sectional sand mold may be formed, said sections fitting upon section *C* substantially in a horizontal plane, the sections *A* and *B* being separable and fitting snugly together substantially along the curved outline of the model from which the casting is to be made, which outline is marked by a curved supporting-wall, and means for removably securing the flask-sections in their relative positions, substantially as described.

6. In a flask for casting dies from undercut dental models, the combination with a cope *C* adapted to receive the cast bearing the dental model, of a ring or section *A* and a flange *B* wherein the sectional sand mold is formed, the said latter sections being laterally shaped to fit together along a curved line conforming substantially to the exterior outline of the dental model, and means for removably securing the flask-sections together, substantially as described.

7. A dental casting-flask consisting of three sections, to wit, a cope *C* substantially in the form of a cone having a flat parting face, and a drag having a flat parting face and consisting of two sections *A* and *B*, the outer and inner walls of the section *B* having the general form of concentric arcs of circles and the section *A* having an outer wall substantially conforming to the adjacent portion of the cope *C* and an inner wall fitting in the concavity of section *B*, substantially as described.

8. In a dental casting-flask, the combination with a cope *C* wherein the cast bearing the dental model is adapted to be disposed and the metal die may be cast, of a ring *A*, the forward portion of which is shaped to conform substantially to the exterior outline of the dental model *D*, a flange *B* fitting thereon, whereby a parting-line is insured which admits of the use of a two-section sand mold in parts *A* and *B*, and means for removably securing the flask-sections together, substantially as described.

699,007. CLAMP FOR DRAPERY-FRAME. JAMES J. PARK, St. Louis, Mo. Filed June 2, 1901. Serial No. 62,222. (No model.)

Claim.—In combination with a frame for supporting drapery over windows, doors and the like, a series of clamps, one for each side of said frame and of equal length therewith and adapted to be placed over the drapery and the sides of the frame and turned to stretch the drapery, the adjacent ends of the clamps being beveled in order to form square corners and perfectly close joints to conceal the drapery when in position, substantially as specified.

699,008. MACHINE FOR MORTISING WINDOW-FRAMES. FRANK V. FILLARD, Windsorpark, Fla., assignor to the Smith and Phillips Manufacturing Company, Chicago, Ill., a Corporation of Illinois. Filed Nov. 7, 1900. Serial No. 26,707. (No model.)

Claim.—1. The combination in a machine for mortising the sides of window-frames, of the adjustable cutter for cutting both the pulley-opening and the flange-space, a fast-lever effecting the adjustment of the cutter by a downward movement, a movable stop arresting the lever when it has descended far enough for the cutting of the flange-space and releasable by the operator's foot, and a second stop arresting the lever when it has descended far enough for the cutting of the pulley-opening, substantially as specified.

2. The combination in a machine for mortising the sides of window-frames, of a vertical-moving cutter acting to cut both the pulley-opening and the flange-space, a fast-lever for raising the cutter to its work and by which the operator retains it in action, a regulating-latch pivoted to the lever and acting to arrest it in an intermediate position, said latch being releasable by the foot, and means for arresting the lever when it reaches its lowest position, substantially as specified.

3. The combination in a machine for mortising the sides of window-frames of a vertically-movable cutter adapted to cut both the pulley-opening and the flange-space, a fast-lever, and a regulating-latch attached to the lever where it may be operated by the same foot which actuates the lever, said latch allowing the lever two operative positions, substantially as specified.

4. The combination with a vertically-movable cutter adapted to cut both the pulley-opening and the flange-space in the side, of the table, a side-supporting frame movable laterally on the table and having a guide entering the parting-strip groove of the side, and means for moving the side lengthwise while the cutting is being done, substantially as specified.

5. The combination with the vertically-movable cutter, of the table, the side-supporting frame having a guide adapted to enter the parting-strip groove of the side, a movable gage for positioning the end of the side, and means for actuating said gage in imparting longitudinal movement to the side, substantially as specified.

6. The combination with the vertically-movable cutter adapted to cut both the pulley-opening and the flange-space in the side, a frame for supporting the side and having a guide entering the longitudinal groove of the side and also made movable on the table to shift the side laterally, a gage for positioning the side lengthwise, and means for moving the side lengthwise on the frame, substantially as specified.

7. The combination in a machine for mortising the sides of window-frames, of a vertically-movable cutter adapted to cut both the pulley-opening and the flange-space, a table, a guide supported from the table and fitting the parting-strip groove of the side and permitting endwise movement of the side, and means for moving the side endwise a determined distance while the cutter is forming the flange-space and a low distance while the cutter is forming the pulley-opening, substantially as specified.

8. The combination in a machine for mortising the sides of window-frames, of a vertically-movable cutter acting to cut both the pulley-opening and the flange-space, a table on which the side may be positioned horizontally, a guide on the table fitting the parting-strip groove of the

and permitting endwise movement thereof and a hand-lever for moving the stile longitudinally while cutting, said lever having means for determining the extent of movement when cutting the spaces and means for determining the extent of movement when cutting the openings, substantially as specified.

9. The combination with means for cutting the mortises, of a support for the stile having a guiding-rib adapted to enter the longitudinal groove of the stile and to permit longitudinal movement of the stile while the cutting is under way, and a device for so moving the stile predetermined distances, substantially as specified.

10. The combination with means for cutting the mortises, of a support for the stile having a guiding-rib adapted to enter the longitudinal groove of the stile and to permit longitudinal movement of the stile while the cutting is under way, and a device for so moving the stile predetermined distances acting to move it a less distance while the pulley-opening is being cut than while the flange-openings are being cut, substantially as specified.

11. In a machine for mortising window-frame stiles, a table and a laterally-adjustable frame supporting the stile, and having a sliding dovetail connection with the table, in combination with locking means consisting of the block 29 engaging the table-groove, the pin bearing upon the bottom of the dovetail groove and the eccentric having its bearings in said block, substantially as specified.

12. The combination with the movable frame and the stationary support therefor, the former having a dovetail tongue and the latter a dovetail groove receiving the tongue, of means for locking it in position consisting of an eccentric and a support therefor mounted on the frame, a detachable pin operated by the eccentric, a stationary surface against which said pin is forced by the eccentric, and the leather 70 interposed between the eccentric and pin, substantially as specified.

699,009. PROCESS OF PRECIPITATING COPPER FROM WATER. AMOS J. FOLGERSON, Whitehall, Mont., assignor of two-thirds to Joseph Hinch and Albert C. Dygart, Butte, Mont. Filed Jan. 10, 1902. Serial No. 69,177. (No specimens.)

Claim.—1. The herein-described process for the treatment of copper-water, which consists in adding to such water before it enters the pipes of the pumping system, a precipitant solution containing an excess of alkali.

2. The herein-described process of treating copper-water, which consists in adding to such water a precipitant solution containing an excess of alkali, forcing the water containing the precipitant in suspension through pipes, and subsequently separating the precipitate.

3. The herein-described process of treating copper-water, which consists in adding to such water before it enters the pipes of the pumping system, a precipitant solution containing a calcium salt and an excess of calcium hydrate.

699,010. MANUFACTURE OF SEED PRODUCTS. FREDERICK B. POTT, Augusta, Ga. Filed Apr. 4, 1901. Serial No. 64,304. (No specimens.)

Claim.—In the manufacture of seed products, first treating seeds in their natural dry condition to separate the hulls and husks, then heating and pressing the husks to extract the oil, and grinding the cake to form a meal and combining the same with a meal formed from the hulls, substantially as set forth.

699,011. APPARATUS FOR THE MANUFACTURE OF CONCENTRATED SULFURIC ACID. WILLIAM R. GORDON, Florida, Cal. Filed July 2, 1900. Serial No. 728,699. (No model.)

Claim.—1. In an apparatus for obtaining sulfuric acid, the combination of a kiln for burning sulfur, a reaction device and a flue extending from said kiln to said reaction device, said flue having a series of steps over which the acid flows from the reaction device in continuous contact with the gases passing from the furnace to said device.

2. In an apparatus for obtaining sulfuric acid, the combination of a kiln for burning sulfur, a reaction device having an opening at one side near its bottom, a flue extending from said kiln to said reaction device and communicating therewith through said opening, said flue having a series of steps over which the acid flows in continuous contact with the gases passing from the furnace to the reaction device, and a ledge at said opening over which the acid flows from the reaction device into said flue.

3. In an apparatus for making concentrated sulfuric acid, the combination of a sulfur-kiln, a reaction device having an opening at one side near its bottom, a flue extending from said kiln to said reaction device and communicating therewith through said opening, a ledge at said opening over which the acid flows from the reaction device into said flue, said flue curving to expose the acid to the heating and concentrating action of the sulfur-fumes, and means for regulating the depth of the liquid at the bottom of the reaction device so as to secure a uniform flow of liquid through the flue.

4. In an apparatus for making concentrated sulfuric acid, the combination of a burner-kiln, a reaction device, and a flue between said kiln and reaction device comprising separable sections of non-conducting material, the bottom of said flue being in the form of a series of steps over which the acid from the reaction device is adapted to flow for exposure to the sulfur-fumes whereby concentration is effected.

5. In an apparatus for making concentrated sulfuric acid, the combination of a burner-kiln, a reaction device, and a flue between said kiln and reaction device, the bottom of said flue being in the form of a series of steps over which the acid from the reaction device is adapted to flow, each of said steps being in the form of a slab provided with upwardly-extending flanges at the back and sides thereof, and a downwardly-extending lip at the front edge thereof for delivering the stream of acid to the next step.

6. In an apparatus for making concentrated sulfuric acid, the combination of a burner-kiln, a reaction device, a flue between said kiln and reaction device, the bottom of said flue being in the form of a series of steps each of which is composed of a slab provided with upwardly-extending flanges at the back and sides thereof, and a downwardly-extending lip at the front edge thereof, said lip overlapping the upwardly-extending flange at the back of the next adjacent step.

7. In an apparatus for making concentrated sulfuric acid, the combination of a sulfur-kiln, a reaction device, a concentrating-flue disposed between the sulfur-kiln and reaction device and adapted to convey the sulfur-fumes from the kiln to the reaction device and to expose the acid from said reaction device to the heat of said fumes, said flue being provided with a slot near said kiln, and a receptacle connected with said slot for receiving the acid delivered therethrough.

8. In an apparatus for making concentrated sulfuric acid, the combination of a sulfur-kiln, a reaction device, and a concentrating-flue disposed between the sulfur-kiln and reaction device and adapted to convey the sulfur-fumes from the kiln to the reaction device, said flue being composed of non-conducting material and having a step-shaped bottom for exposing the acid in a continuous sheet to the concentrating action of said fumes.

699,012. PROCESS OF OBTAINING TIN BY ELECTROLYSIS. BENNETT GUINTELL, Argentan, France. Filed Apr. 24, 1900. Serial No. 14,188. (No specimens.)

Claim.—The process of separating tin electrolytically from tin-scraps, which consists in suspending the scrap, as the anode, in a bath composed of an aqueous solution of nitrate of tin to which have been added chlorid of ammonium and chlorid of tin, suspending a suitable cathode in the bath, and finally passing the electric current through the anode, bath and cathode, substantially as described.

699,018. MECHANISM FOR CONVERTING MOTION. JOHN M. RABHOFF, Chicago, Ill. Filed July 2, 1900. Renewed Apr. 3, 1901. Serial No. 84,881. (No model.)

Claim.—1. In a mechanism for converting motion, the combination of a shaft having in its body a spiral groove with tapered or inclined side walls or flues, a head mounted on the shaft, journals or stems rotatably mounted in the head on opposite sides thereof each journal or stem having a bearing or contact with a cone-shaped or tapered peripheral face or wall to engage the side face or wall of the spiral groove, and an adjustable journal-bearing for carrying each journal or stem, entered into the head on opposite sides and transversely of the shaft, substantially as described.

2. In a mechanism for converting motion, the combination of a shaft having in its body a spiral groove with tapered or inclined side walls or flues, a head mounted on the shaft and endwise movable thereon, journals or stems rotatably mounted in the head on opposite sides thereof each journal or stem having a bearing face or contact with a cone-shaped or tapered peripheral face or wall and of a less diameter than the width of the spiral groove for engagement with the side face or wall of the spiral groove on opposite sides of the contact or bearing and an adjustable journal-bearing for carrying each journal or stem entered into the head on opposite sides and transversely of the shaft, substantially as described.

3. In a mechanism for converting motion, the combination of a shaft having in its body a spiral groove with tapered or inclined side walls or flues, a head mounted on the shaft and endwise movable thereon, journals or stems rotatably mounted in the head on opposite sides thereof each journal or stem having a bearing face or contact with a cone-shaped or tapered peripheral face or wall of less diameter than the width of the spiral groove and of a less depth than the depth of the spiral groove for engaging the side face or wall of the spiral groove on the opposite sides of the bearing or contact with a clearance-space between the bottom of the groove and the end face of the bearing or contact and an adjustable journal-bearing for carrying each journal or stem entered into the head on opposite sides and transversely of the shaft, substantially as described.

4. In a mechanism for converting motion, the combination of a shaft having in its body a spiral groove with tapered or inclined side walls or flues, a head mounted on the shaft and endwise movable thereon, journals or stems rotatably mounted in the head on opposite sides thereof, each journal or stem having a bearing or contact with a cone-shaped or tapered peripheral face or wall to engage the side face or wall of the spiral groove, a fixed cone and an adjustable cone on each journal or stem, an adjustable sleeve for each journal or stem into which the journal or stem is entered, and balls between the face of the cones on the journal or stem and the face of the sleeve, substantially as described.

5. In a mechanism for converting motion, the combination of a shaft having in its body a spiral groove with tapered or inclined side walls or

flues, a head mounted on the shaft and endwise movable thereon, journals or stems rotatably mounted in the head on opposite sides thereof each journal or stem having a bearing face or contact with a cone-shaped or tapered peripheral face or wall to engage the side face or wall of the spiral groove, an adjustable sleeve for each journal or stem, a flange on the interior wall of the sleeve, a fixed cone and an adjustable cone on the journal or stem, and balls between the fixed cone and the sleeve-flange and between the adjustable cone and the sleeve-flange, substantially as described.

6. In a mechanism for converting motion, the combination of a shaft having in its body a spiral groove with tapered or inclined side walls or flues, a head mounted on the shaft and endwise movable thereon, journals or stems rotatably mounted in the head on opposite sides thereof each journal or stem having a bearing or contact face with a cone-shaped or tapered peripheral face or wall to engage the side face or wall of the spiral groove, an adjustable sleeve for each journal or stem entered into the head on opposite sides and transversely of the shaft, a cone on the journal or stem and balls between the cone and the face of the sleeve, substantially as described.

7. In a mechanism for converting motion, the combination of a shaft having in its body a spiral groove, a head mounted on the shaft and endwise movable thereon, journals or stems rotatably mounted in the head on opposite sides thereof each journal or stem having a bearing or contact face to engage with the spiral groove of the shaft, an adjustable sleeve for each journal or stem, cones on the journals or stems, and balls for the cones around the journals or stems, substantially as described.

8. In a mechanism for converting motion, the combination of a shaft having in its body a spiral groove with tapered or inclined side walls or flues, a head mounted on the shaft and endwise movable thereon, a journal or stem rotatably mounted in the head and having a bearing or contact with a cone-shaped or tapered peripheral face or wall to engage the side face or wall of the spiral groove, and an adjustable journal-bearing carrying the journal or stem and entered into the head transversely of the shaft, substantially as described.

9. In a mechanism for converting motion, the combination of a shaft having in its body a spiral groove, a head mounted on the shaft and endwise movable thereon, a journal or stem rotatably mounted in the head and having a bearing or contact with a peripheral end face or wall to engage the spiral groove, a fixed cone and an adjustable cone on the journal or stem, an adjustable sleeve for the journal or stem and into which the journal or stem is entered, and balls between the face of the cones on the journal or stem and the face of the sleeve, substantially as described.

699,014. GOVERNOR FOR EXPLOSIVE-ENGINE. JOHN V. RAY, Jr., Ridgewood Park, N. Y., assignor, by mesne assignments, to William O. Worth, Chicago, Ill., William R. Donaldson, Louisville, Ky., and Henry W. Kellogg, Battle Creek, Mich. Filed Aug. 20, 1900. Renewed Nov. 2, 1900. Serial No. 26,201. (No model.)

Claim.—1. In a governor for gas-engines, the combination with a tubular governor-rod, of a rod within the same, centrifugally-acting means

connected with the inner rod, a sparking device, and a cam that actuates the spark and is engaged by the aforesaid inner rod for the purpose of shifting said cam, substantially as described.

2. In a governor for gas-engines, the combination with a tubular rod, of a rod within the same, centrifugally-acting means carried by the tubular rod and connected with the inner rod, a sparking device, a rotary actuating cam therefor, said cam being shiftable by connection with the aforesaid inner rod, and the exhaust-valve and the cam arranged in connection therewith.

3. In a governor for gas-engines, the combination with the tubular governor-rod, the links, the balls, the movable collar, the rod located in said tubular rod, the pin engaging with said collar, the pin at the opposite end of said rod passing through a slot in said rod, the rotatable sleeve having a spiral slot with which said last-mentioned pin engages, the cam on said sleeve, and the spring-actuated electrode, substantially as described.

4. In an engine-governor, the combination with a tubular governor-rod, of a rod within the same, governor means connected with the inner rod, a sparking device, and a cam engaged by the aforesaid inner rod, all arranged to operate so that the spark will be produced at the proper point in the length of the stroke of the piston, substantially as described.

5. In a governor for gas-engines, the combination with the tubular governor-rod, of the centrifugally-acting governor device, the movable collar, the rod within the tubular rod, said inner rod having a pin engaging the movable collar, the sparking device, a rotary cam for operating the spark, said cam being on a slotted sleeve engaged by another pin on the inner rod, all substantially as described.

6. In an engine of the class described, a cylinder, a valve for controlling the supply of fuel for said cylinder, an igniter for said charge of fuel, a speed-responsive device driven by said engine, an internal and external shaft, the internal shaft connected to the governor and adapted to be reciprocated thereby, a device on the external shaft for operating the igniter, and a dog or the like, connected to the internal shaft and extending through the hollow shaft, whereby the said device, or a part thereof may be rotated, when the said internal shaft is reciprocated, substantially as set forth.

7. An internal-combustion motor having a hollow cam-shaft, a spark-actuating cam loosely mounted thereon, a cam-controlling rod within the hollow shaft, centrifugal weights adapted to actuate the rod as the shaft revolves and means for connecting the rod and spark-cam.

699,015. RAILROAD-TIE. ERIC C. BROWN, Washington, D. C.
Filed Jan. 14, 1902. Serial No. 39,699. (No model.)

Claim.—1. In means for securing railroad-ties in a road-bed, the combination of bearing-blocks placed between adjacent ties, independent means for securing said bearing-blocks against longitudinal or lateral displacement, and rails secured to said ties and bearing-blocks, substantially as set forth.

2. In means for securing railway-ties in a road-bed, the combination of bearing-blocks placed between adjacent ties, metal strips or bars secured to and connecting said bearing-blocks and ties, and rails secured to said ties and bearing-blocks, substantially as set forth.

699,016. VENTILATOR. ROBERT E. BROWN, Paducah, Ky.
Filed July 29, 1901. Serial No. 69,119. (No model.)

Claim.—In ventilators, the combination with an overhead main shaft having a spur gear-wheel thereon; of parallel vertical guides having bearings at their upper ends in which the shaft is journaled, a horizontal shaft journaled in bearings on the guides beneath the said main shaft, a spur-pinion on said lower shaft meshing with the said spur gear-wheel, a drum fixed on said lower shaft, a weight slidably mounted on the said guides, a flexible connection between the said drum and weight, and means for rocking the said main shaft.

699,016.

699,017. WRENCH. WILLIAM RICHMOND, High, Ill., assignor to Henry B. Weatherill, High, Ill. Filed Nov. 16, 1901. Serial No. 39,699. (No model.)

Claim.—1. In a wrench, the combination with a casing open at its forward end and having rearwardly-extending parallel walls, of jaws adapted to be automatically spread apart, a follower extending from wall to wall of the casing and having a rearwardly-extending control, threaded portion, and means for actuating said follower.

2. In a wrench, the combination of a casing having its upper and lower walls parallel in its forward portion, and converging in its rearward portion, of jaws adapted to be automatically spread apart, a follower to engage the outer angles of the inner ends of said jaws, and adapted to have its edges in bearing contact with the inner face of the walls of the casing and to seat itself, valve-like, in the converging portion of the casing when the jaws are fully spread apart, and means for actuating said follower.

699,018. APPARATUS FOR FORMING PLATES. ANDRUS SANDVIG, Lillehammer, Norway. Filed Nov. 12, 1900. Serial No. 39,671. (No model.)

Claim.—1. A mold having a die therein, two cooperating parts movable toward the die, one of the parts movable simultaneously with and also independently of the other and a yielding molding material between the cooperating parts and die, substantially as set forth.

2. A mold having a die therein, a cooperating sleeve and plunger movable toward the die, said plunger movable with and also independently of said sleeve and a yielding molding material between the plunger and die, substantially as described.

3. A mold comprising a casing and a detachable base-plate, a die therein, a cooperating sleeve and plunger movable toward the die, means to lock the sleeve against motion out of the casing, said plunger movable with and also independently of said sleeve and a yielding molding material above the die, substantially as described.

4. A mold, a die therein, a sleeve movable toward the die and a plunger movable with respect to the sleeve, whereby any one of a series of plungers is capable of being substituted for the first one, and a yielding molding material above the die, substantially as set forth.

699,019. MANUFACTURE OF LACE REPRESENTING HOGS WORK. **BERNARD B. BARNUM**, Paris, France. Filed May 21, 1901. Serial No. 61,306. (Specimens.)

Claim.—The herein-described method of making lace having a mosaic effect, consisting in forming flat surfaces grouped into a suitable design having the appearance of a mosaic by passing material through the mesh of the fabric with the threads of the mesh interposed between each of the flat surfaces, and then edging said design by a line of flat surfaces, the threads of the mesh separating said surfaces from one another thereby forming a flat edging surface to throw the mosaic effect of the design into prominence.

699,020. HUT-LOCK FOR VEHICLE AXLES. **OSWALD SHAWVER**, Canton, Ohio. Filed Oct. 7, 1901. Serial No. 71,999. (No model.)

Claim.—The combination of a vehicle axle having mounted thereon a chain having a narrow-threaded portion, a nut located upon the narrow-threaded portion of the chain, a bolt provided with an apertured head and head located beyond the end of the axle and chain, an angular frame having pivotally attached thereto a head, said head provided with a pin adapted to engage the apertured head of the bolt, and an arm pivoted to the head of the pin and provided with an angled flange at its free end, all arranged substantially as and for the purpose specified.

699,021. LOADING-DRAW. **OSWALD SHAWVER**, Canton, Ohio. Filed Aug. 29, 1901. Serial No. 73,794. (No model.)

Claim.—1. A loading-draw, provided with separate and independent freely-movable or loosely-mounted anti-friction devices exposed at one

of its sides or faces for direct engagement and movement in one direction by the material being raised, and individual means for locking or retaining each of the anti-friction devices against reverse movement by said material; substantially as described.

2. A loading-draw provided with freely-rotating or loosely-mounted anti-friction rollers, exposed at one of its faces or sides for direct engagement and rotation in one direction by the material being raised, and means for preventing reverse rotation of the rollers by the opposite movement of the material; substantially as described.

3. A loading-draw, provided with a series of recesses and anti-friction rollers mounted loosely in said recesses and projecting thereabove for direct engagement and rotation in one direction by the material being raised, and means for preventing reverse rotation of the rollers by said material; substantially as described.

4. A loading-draw provided with a series of recesses and elongated journal-bearing slots, in combination with anti-friction-rolls arranged within and projecting beyond the recesses and journaled in the elongated bearings, the recesses and slots being so arranged that the rollers in their rear positions will bear against the inner surfaces of the recesses.

5. A loading-draw provided with a series of recesses and elongated downwardly-inclined journal-bearing slots, in combination with anti-friction-rolls arranged within and projecting beyond the recesses, the recesses and slots being so arranged that the rollers in their rear positions will bear against the inner surfaces of the recesses.

6. A reversible loading-draw, provided with oppositely-projecting heads at one end, loosely-mounted rollers projecting above one face or side of the beam for direct engagement and rotation in one direction by the material being raised, and means for preventing reverse rotation of the rollers by the said material; substantially as described.

699,022. DOWNHAUL FOR MINES. **CARL L. R. SUMNER**, Wilkes-Barre, Pa., assignor of one-half to John Jones & Company, Incorporated, Pittsburg, Pa., a Corporation of Pennsylvania. Filed Feb. 19, 1902. Serial No. 92,857. (No model.)

Claim.—1. A downhaul for use, having in combination, a chain having oppositely-oveling dogs, a car provided with a flange-plate or projection and track portions having opposite inclinations whereby the car is caused to move faster than the chain and then checked, substantially as set forth.

2. A downhaul for use, having in combination, a chain having oppositely-oveling dogs, a car provided with a flange-plate or projection, a track having a downwardly-inclined portion adapted to impart to the car a speed greater than that of the chain and means for reducing the speed of the car below that of the chain, substantially as set forth.

3. A downhaul for use, having in combination, a chain, oppositely-oveling dogs mounted on the chain, said dogs being provided with overlapping flanges, substantially as set forth.

699,023. DOWNHAUL FOR MINES. **CARL L. R. SUMNER**, Wilkes-Barre, Pa., assignor of one-half to John Jones & Company, Incorporated, Pittsburg, Pa., a Corporation of Pennsylvania. Filed Feb. 19, 1902. Serial No. 92,858. (No model.)

Claim.—A downhaul having in combination of a chain pair of oppositely-oveling dogs pivotally mounted on the chain and provided with weights for holding the adjacent or inner ends of each pair in operative position, a depressing-plate arranged parallel with the line of movement of the chain, and a lateral extension from the front dog of each pair adapted to engage and be shifted by said plate, substantially as set forth.

699,024. BRAKE FOR UPRAULS FOR MINES. **CARL L. R. SUMNER**, Wilkes-Barre, Pa., assignor of one-half to John Jones & Company, Incorporated, Pittsburg, Pa., a Corporation of Pennsylvania. Filed Feb. 19, 1902. Serial No. 92,859. (No model.)

Claim.—1. An uphaul for use having in combination a chain, a rail parallel with the line of movement of the chain, an arm having one

end connected to the chain and means on the opposite end of the arm operative on a rearward movement of the chain to grip the rail, substantially as set forth.

2. An uphaul for use having in combination a chain, a rail parallel with the line of movement of the chain, and an arm pivotally mounted on the chain and provided at its outer end with fingers projecting down on opposite sides of the rail, substantially as set forth.

3. An uphaul for use having in combination a chain, a rail parallel with the line of movement of the chain, an arm pivotally mounted on the chain and provided at its outer end with fingers projecting down on opposite sides of the rail, and means for holding the fingers from engagement with the rail during the forward movement of the chain, substantially as set forth.

4. An uphaul for use having in combination a chain, a rail parallel with the line of movement of the chain, an arm pivotally mounted on the chain and provided at its outer end with fingers projecting down on opposite sides of the rail and a spring for pushing the outer end of the arm in the direction of movement of the chain, substantially as set forth.

699,025. AUTOMATIC DEVICE FOR THE SAFE OPERATION OF ELECTRIC CONDUCTORS WITH OR WITHOUT GUARD-WIRES. **ROBERT E. SHERRILL** and **OSWALD SHAWVER**, Canton, Ohio. Filed Aug. 21, 1901. Serial No. 71,992. (No model.)

Claim.—1. In an automatically-operated device for electric circuits, the combination with the main feeder, and main circuit-conductor, and an automatic switch adapted to open and close the circuit through said feeder; of a controlling device consisting of a pair of stationary coils, connected in circuit with said feeder and conductor, respectively, a balancing-arm pivoted above said coils, and plungers or cores extending from the ends of said arm adapted to reduplicate within said coils, a swinging arm carried by said balancing-arm, a contact carried by said arm, in circuit with said main feeder, and contacts adapted to close the circuit with said swinging-arm contact, whereby when said circuit is closed said automatic switch is thrown open, substantially as described.

2. In a controlling device for electric circuits, the combination with a pair of stationary coils, adapted to be independently connected in the circuit, and a pair of stationary contact-points electrically connected together; of a balancing-arm pivoted above said coils, plungers upon each end of said arm, adapted to reduplicate within said coils, a swinging arm carried by said balancing-arm, and a contact carried by said arm also connected in the circuit, and adapted to close the circuit with said stationary contacts, substantially as described.

699,026. CLEANER FOR SHAKING-SIEVES. **FRANK L. SHAWVER**, Wilkes-Barre, Pa. Filed Jan. 24, 1901. Serial No. 65,126. (No model.)

Claim.—A shaking-cloth cleaner adapted to be carried by a flange-plate support beneath and parallel with the cloth, consisting of a base and a spring-wire will last into the form of a loop and having its ends connected

to the base, said coil projecting rearward at an upward incline from its line of attachment to the base.

699,027. TIME-LAMPFLIGHTER. **OSWALD SHAWVER** and **HARRY E. PALMER**, New York, N. Y.; and **Palmer** assignor to said Shawver. Filed Sept. 11, 1900. Serial No. 29,697. (No model.)

Claim.—1. In means for automatically turning gas on or off at predetermined times, the combination of a main gas-pipe, a cock on said pipe, a falling lever attached to the plug of the cock on the main gas-pipe, a weight on the outer end of said lever, a pin carried by said weight, a double-ended supporting-lever, one end of which sets to support the weighted end of the falling lever by means of said pin, a bracket to which the double-ended supporting-lever is pivoted, a base-plate carrying the said bracket, a clock-casing to which the base-plate is fastened, a double-armed catch-lever, one end of which sets to hold the other end of said double-ended supporting-lever, another bracket carried by the said base-plate, to which said double-armed lever is pivoted, a cam or striker to act upon the other end of the catch-lever so as to release the double-ended supporting-lever, and a winding upon which said cam or striker is mounted, substantially as herein set forth.

2. In an apparatus for turning gas on or off at predetermined times, the combination of the gas-cock *a*, the lever *b* mounted thereon for automatically closing or opening said cock, the weight *c* on said lever and the pin *d* projecting therefrom, the double-ended supporting-lever *e*, the double-armed catch-lever *f* detaining said supporting-lever, the bracket *g*, *h* to which said lever *e* and *f* are pivoted, the base-plate *i* carrying said bracket *g*, *h*, the clock-casing *j* to which said base-plate is attached, and the striker *k* mounted on the winding-cum of an alarm-clock movement of common form for releasing said catch-lever *f* to release the supporting-lever *e*, substantially as set forth.

699,028. AUTOMOBILE. **ALFRED L. SHAWVER** and **HARRY E. PALMER**, New York, N. Y.; and **Palmer** assignor to said Shawver. Filed Dec. 4, 1901. Serial No. 94,699. (No model.)

Claim.—1. An automobile, comprising a wheeled vehicle provided with depending legs, an electric motor suspended from said legs and mounted free to swing, gearing connecting said motor to a wheel of said vehicle, a longitudinal brace connecting said motor with some rigid part of said

vehicle, and provided with a movable joint for shortening the same, and a thumb-screw for normally holding said movable joint in a predetermined position.

2. An automobile, comprising a wheeled vehicle provided with depending legs having apertures, a horizontal bar extending into said apertures, blocks of rubber located in said apertures above and below said horizontal bar for supporting the same and allowing a limited springy motion thereof, a motor suspended from said bar, and means for connecting said motor with a revoluble member of said vehicle.

3. An automobile, comprising a wheeled vehicle provided with depending legs, an electric motor suspended from said legs and mounted free to swing, four additional legs attached to said motor, bolts attached to said legs, on which are mounted rubber buffers, said bolts being adjustable at the four corners to enable said rubber buffers to be tightened and adjusted at will, said bolts passing through said buffers and up into the frame from which the motor is hinged, thereby giving the motor a limited spring horizontal motion.

4. An automobile, comprising a vehicle provided with a longitudinal frame rigid therewith, a motor pivoted centrally to the said frame and provided with oppositely-disposed groups of legs, and oppositely-disposed groups of buffers engaging the opposite ends of said frame and also engaging said legs on said motor.

5. An automobile, comprising a wheeled vehicle having a rigid frame provided with legs, a motor pivoted centrally upon said frame and provided with oppositely-disposed legs mating said legs upon said frame, and buffers normally connecting said legs upon said frame with said legs upon said motor.

6. An automobile, comprising a vehicle having a frame provided with holes, a motor pivoted upon said frame and provided with legs, longitudinal members swivelled in said holes, and buffers connecting said frame with said legs upon said motor.

7. An automobile, comprising a vehicle having a frame provided with holes, a motor pivoted upon said frame and provided with legs, longitudinal members swivelled in said holes and provided with screw-threads, buffers surrounding said longitudinal members, and adjusting-nuts engaging said screw-threads for governing the tension of said buffers.

8. An automobile, comprising a vehicle having a frame provided with holes, a motor pivotally mounted upon said frame and provided with cup-shaped legs, longitudinal members swivelled in said holes and extending loosely into said cup-shaped legs, said longitudinal members being threaded, cylindrical cushions of resilient material adjacent to said longitudinal members, and adjustable nuts upon said longitudinal members for tensioning said cushions, the arrangement being such that the swinging of said motor causes said longitudinal members to reciprocate through said holes in said frame.

9. An automobile, comprising a wheeled vehicle provided with a frame, a motor pivotally connected to said frame and normally free to

swing, buffers for cushioning the swinging motions of said motor, and a brace of variable length for governing the position of the motor relatively to said vehicle.

10. An automobile, comprising a wheeled vehicle provided with a frame, a motor pivotally connected to said frame and normally free to swing, buffers for cushioning the swinging motions of said motor, means controllable at will, for adjusting said buffers relatively to said motor, and a brace of variable length for governing the position of said motor relatively to said vehicle.

11. An automobile, comprising a wheeled vehicle provided with a frame, a motor suspended from said frame and provided with legs, said motor being normally free to swing, buffers connected with said frame and said legs and disposed upon opposite sides of said motor for cushioning the same when swung in either direction, and a brace of variable length for governing the tension of said motor relatively to said vehicle.

12. An automobile, comprising a wheeled vehicle provided with a frame, a motor suspended from said frame, buffers connected with said motor and said frame and disposed on opposite sides of said motor for cushioning the same when swung in either direction, means controllable at will, for adjusting said buffers, and a brace of variable length for governing the position of said motor relatively to the vehicle.

13. An automobile, comprising a wheeled vehicle, an electric motor mounted upon said vehicle and normally free to swing relatively thereto, gearing connecting said motor with a wheel of said vehicle, means for disconnecting said gearing, and buffers for cushioning the swinging motions of said motor.

14. An automobile, comprising a wheeled vehicle, an electric motor mounted upon said vehicle and normally free to swing relatively thereto, gearing connecting said motor with a wheel of said vehicle, a longitudinal brace for normally holding said motor in a predetermined position, means for virtually changing the length of said brace to allow the gearing to be disconnected, and buffers for cushioning the swinging motions of said motor.

15. An automobile, comprising a wheeled vehicle, an electric motor mounted upon said vehicle and normally free to swing relatively thereto, gearing connecting said motor with the running-gear of the vehicle, mechanism for normally holding said motor in a predetermined position, and buffers located upon opposite sides of said motor to cushion the swinging motion thereof in opposite directions.

16. An automobile, comprising a wheeled vehicle, an electric motor mounted upon said vehicle and normally free to swing, gearing connecting said motor with a wheel of said vehicle, buffers for cushioning the swinging of said motor, a brace connecting said motor with some rigid part of the vehicle, means for virtually shortening the brace, and means controllable at will, for adjusting said buffers and thereby changing the normal position of said motor relatively to said wheel of said vehicle.

17. An automobile, comprising a wheeled vehicle provided with a storage battery, an electric motor pivotally mounted upon said vehicle, gearing connecting said motor with a wheel of said vehicle, a rigid longitudinal member for normally holding said motor in a predetermined position, buffers disposed upon opposite sides of said motor for cushioning the same in two directions, and screw members for adjusting the normal tension of said buffers.

689,039. CONTROLLER FOR ELECTRIC VEHICLES. ALFRED L. SHIMMUS and HARRY E. PALMER, New York, N. Y.; said Palmer assignor to said Shimmus. Filed Dec. 12, 1901. Serial No. 55,321. (No model)

Claim.—1. A controller for electric vehicles, comprising contacts connected with a resistance, a movable electrode for engaging said contacts, and means for forming a short circuit about said contacts at the instant when the said electrode engages said contacts.

2. A controller for electric vehicles, comprising a commutator for reversing the direction of an electric current and actuated by an armature, a lever provided with an armature mating the armature of said commutator; and a current-controlled device for temporarily causing both of said armatures, thereby causing them to adhere together.

3. A controller comprising a series of contacts to be connected with variable resistance, a movable electrode for engaging said contacts, electric connections for said electrode and said resistance, and a movable bridge member flexibly connected with said movable electrode, for the purpose of short-circuiting said stationary contacts at the instant when said movable electrode engages said first-mentioned contacts.

4. A controller comprising an electric circuit for actuating a motor, a movable electrode in said circuit, a plurality of contacts connected in multiple with variable resistance and disposed adjacent to the path of said electrode so as to be successively engaged by said electrode, a contact adjacent to the path of said movable electrode and connected with a short-circuit of comparatively high resistance, the distribution of said con-

facts relatively to the path of said movable member being such that said member in traveling on or to successively engage said contacts connected to said variable resistances, first engages and then disengages the contact connected with the short-circuit, thus speeding the motor in a maximum flash.

5. A controller comprising a commutator for reversing the direction of an electric current, an armature for actuating said commutator, a lever provided with a movable armature mating the armature of said commutator, a current-controlled magnetic device for causing said armature to adhere together so that said commutator may be reversed by the aid of said lever, and means for opening and closing the circuit of said current-controlled device.

6. A controller comprising a commutator for reversing the direction of an electric current, an armature for actuating said commutator, a lever provided with a movable armature mating the armature of said commutator, a solenoid, surrounding both armatures and connected with a circuit for actuating the same, means for opening and closing said circuit, an electrode connected with said lever and movable therewith, contacts disposed adjacent to the path of said movable electrode, resistance electrically connected with said contacts, and means for connecting said electrode, said solenoid and said resistance with a source of electric supply and with a motor to be driven.

7. A controller comprising a commutator for reversing the direction of an electric current, a member for actuating said commutator, a cushion interposed between said member and said commutator, and mechanism controllable at will, for engaging and releasing said member for the purpose of actuating said commutator.

8. A controller comprising a commutator for reversing the direction of an electric current, an armature for actuating said commutator, a cushion interposed between said armature and said commutator, a lever provided with a movable armature, and an electromagnetic device for temporarily exciting both of said armatures, thus causing them to adhere firmly together.

9. A controller comprising a commutator for reversing the direction of an electric current, a cylindrical armature mechanically connected therewith, a controlling-lever provided with a cylindrical armature mating said first-mentioned armature, and a solenoid for temporarily exciting said armatures, thus causing them to adhere together.

10. A controller comprising a commutator for reversing the direction of an electric current, a cylindrical armature mechanically connected therewith, a cushion interposed between said armature and said commutator, a controlling-lever provided with a cylindrical armature mating said first-mentioned armature, and a solenoid for temporarily exciting said armatures, thus causing them to adhere together.

11. A cylindrical armature comprising a movable electrode, stationary contacts to be engaged by the same, an electric circuit connected with said contacts, oppositely-disposed stationary contacts tapping said circuit, and a bridge-electrode caused to said movable electrode by springs and normally held thereby in contact with said movable electrode, the ar-

angement being such that the movement of said movable electrode may cause said bridge-electrode to engage said contacts and disengage said movable electrode at the moment when said movable electrode engages first-mentioned contacts.

899,080. MEANS FOR REGULATING THE SUPPLY OF WATER AND LIQUID FUEL TO STEAM-GENERATORS. JOHN SHERR, Stirling, Scotland. Filed Nov. 20, 1901. Serial No. 93,902. (No Model.)

Claim.—1. The combination with the two pump-cylinders, plungers working in the cylinders and rigidly connected together for simultaneous motion, of a rod for actuating the connected plungers, means for operating this rod, a spring yieldingly interposed between the rod and its operating means for automatically varying the stroke of both pumps, and a locking device for forming a rigid connection between the rod and its operating means to thereby render the spring inoperative; substantially as described.

2. The combination with a pump and its operating-rod having a shoulder or collar, of a sliding sleeve on the said rod and projecting at its inner end under the said collar or shoulder, a helical spring surrounding the rod within the sleeve, bearing at its outer end against a part carried by the sleeve and at its inner end bearing against the collar, and an operating-rod connected to the said sleeve for reciprocating the pump-rod; substantially as described.

3. The combination with the pump and its operating-rod having a collar or shoulder, of a sliding sleeve on the rod and projecting at its inner end under the said collar or shoulder, a helical spring surrounding the rod within the sleeve and bearing on said collar or shoulder, a tubular nut screwed into the outer end of the sleeve to adjust the tension of the spring, and an operating-rod connected to the sleeve for reciprocating the pump-rod; substantially as described.

4. The combination with the pump and its operating-rod having a shoulder or collar, a sliding sleeve on the pump-rod with its inner end projecting under the said collar, a connecting-rod for operating the sleeve and a helical spring within the said sleeve and forming a yielding connection between it and the pump-rod, of a shoe piece or block movable under the inner end of said sleeve to render the connection between it and the pump-rod rigid; substantially as described.

5. The combination with the two rigidly-connected pump-cylinders, their rigidly-connected plungers, a rod for actuating both plungers, a spring-embodied sleeve for actuating said pump-rod and means for operating the sleeve, of a bracket on one pump, a sliding rod mounted in said bracket and provided with a shoe at its inner end, and means for operating the shoe-carrying rod to move the shoe into and out of engagement with the sliding sleeve; substantially as described.

899,081. SPARK-ARRESTER. EDWARD J. SMITH, High Springs, Fla. Filed June 15, 1901. Serial No. 94,000. (No Model.)

Claim.—1. A laminative spark-arrester comprising in combination with the stack, an arresting-screen composed of the tapering base and upper sections united at their bases, the cylindrical section extending from

the reduced end of the upper tapered section and registering with and movable into and out of position to shut and guard the lower end of the stack, an operating-shaft having a crank-support for the cranking-arms and an operating-crank, a piston connected with said operating-crank, and the cylinder in which said piston operates, said cylinder being mounted on the locomotive steam-chest substantially as set forth.

2. A spark-arrester for locomotives having a movable screen, device for adjusting the screen to position to guard the stack when the engine is working and device for adjusting the screen to such position when the blower is in operation substantially as set forth.

3. The combination in a locomotive of the smoke-stack, the screen movable into and out of position to guard the stack, a transverse shaft extending across the locomotive adjacent to said screen and provided at its middle with means for operating the screen, and at its opposite ends with crank-arms, a cylinder connected with the blower and having a piston connected with one of the crank-arms of the shaft, and a cylinder having a piston connected with the opposite crank-arm of the shaft, said cylinder being mounted on and in communication with the steam-chest of the locomotive, substantially as set forth.

699,082. WATER SUPPLY AND FILTERING SYSTEM. LLOYD E. SMITH, Portsmouth, Ohio. Filed Nov. 4, 1901. Serial No. 21,341. (No model.)

Claim.—1. The described water supply and filtering apparatus comprising an off-shoot extending to a point of delivery, a reservoir-pipe, a series of pipes pendant from the latter, and a series of lateral pipes buried in a sand-bed at the bottom of a natural body of water, and provided with inlet-openings, as shown and described.

2. The described water supply and filtering apparatus comprising an off-shoot leading to a distributing-station, a reservoir-pipe of greater capacity connected therewith, and laid upon a river sand-bed, a series of pipes pendant from said reservoir-pipe, and a double series of lateral feed and filter pipes arranged at right angles to the reservoir-pipe and attached to each pendant pipe, and having openings which are gradually enlarged in diameter from the inner to the outer ends of said feed-pipes, as shown and described.

3. The described water supply and filtering system comprising a reservoir-pipe having a series of pendant pipes and lateral or branch feed-pipes connected with the latter and extending at right angles and provided with inlet-openings, each intake system being buried at a suitable depth in a sand-deposit in the bed of a natural water-supply, and an off-take-pipe attached to the said reservoir-pipe, but having less diameter, and extending to a distributing-station on the bank, as shown and described.

699,088. PROCESS OF MAKING RESIST-WHITE UNDER INDIGO. ARMAND J. STEINMANN, Ludwigshafen, Germany, assignor to Badische Anilin und Soda-Fabrik, Ludwigshafen, Germany, a Corporation of Baden. Filed Dec. 12, 1901. Serial No. 20,003. (No specimens.)

Claim.—1. Process for the production of resist-white under indigo which consists in printing upon the material to be operated upon a resist containing a thickening agent, glycerin and lead peroxide, drying, dyeing with indigo, and then treating in a bath containing hydrochloric acid all substantially as hereinafter described.

2. Process for the production of resist-white under indigo which consists in printing upon the material to be operated upon a resist containing a thickening agent and lead peroxide, drying, dyeing with indigo, and then treating in a bath containing hydrochloric acid all substantially as hereinafter described.

3. Process for the production of resist-white under indigo which consists in printing lead peroxide upon the material to be operated upon, dyeing with indigo, and then treating with hydrochloric acid all substantially as hereinafter described.

699,084. WAREHOUSE-TROLLEY. ALBERT F. GULIVAN and BENJAMIN S. JACOB, Detroit, Mich.; said Jacob assignor to said Gulivan. Filed July 8, 1901. Serial No. 67,117. (No model.)

Claim.—1. In combination with a truck-frame, truck-wheels having their axle mounted in fixed bearings, an independently-rotated center-wheel on each side bar near the handle end thereof, and a draft appliance secured to the frame at the center-wheel and thereof and arranged to be folded to allow the truck to be used as a two-wheeled truck, and to be extended to allow the truck to be used as a four-wheeled truck, substantially as described.

2. In combination with a truck-frame, truck-wheels journaled to axles near the front and thereof, combined center-wheels independently mounted to frames near the handle end thereof, a draft appliance slidably secured to the handle end of said frame, and arranged to be extended and used for draft purposes with the truck resting on four wheels, substantially as described.

699,085. SAFETY APPLIANCE. HARRY F. SMITH, Baltimore, Md., assignor to Francis L. Hingwood, New York, N. Y., and Charles W. Schumann, Jr., Orange, N. J. Filed Apr. 18, 1901. Serial No. 64,067. (No model.)

Claim.—1. In a safety appliance, the combination with a car or carrier, of a cylinder, means for giving the cylinder a movement corresponding to the rate of movement of the car or carrier, stopping device, and means actuated by the cylinder when its movement exceeds the normal rate for throwing the stopping device into action, substantially as described.

2. In a safety appliance, the combination with a car or carrier, of a cylinder, means operated by the movement of the car for giving the cylinder a movement corresponding to the rate of movement of the car or carrier, stopping device, and means actuated by the cylinder when its movement exceeds the normal rate for throwing the stopping device into action, substantially as described.

3. In a safety appliance, the combination with a car or carrier, of a cylinder mounted thereon, means operated by the movement of the car or carrier for giving the cylinder a movement corresponding to the rate of movement of the car or carrier, stopping device, and means actuated by the cylinder when its movement exceeds the normal rate for throwing the stopping device into action, substantially as described.

4. In a safety appliance, the combination with a car or carrier, of a cylinder, means for giving the cylinder a movement corresponding to the rate of movement of the car or carrier, a normally stationary piston in the cylinder, stopping device, means whereby the cylinder causes a movement of the piston when the movement of the cylinder exceeds the normal rate, and means whereby the piston throws the stopping device into action, substantially as described.

5. In a safety appliance, the combination with a car or carrier, of a cylinder, means operated by the movement of the car or carrier for giving the cylinder a movement corresponding to the rate of movement of the car or carrier, stopping device, a normally stationary piston in the cylinder, means whereby the cylinder causes a movement of the piston when the movement of the cylinder exceeds the normal rate, and means whereby the piston throws the stopping device into action, substantially as described.

6. In a safety appliance, the combination with a car or carrier, of a cylinder mounted thereon, means operated by the movement of the car or carrier for giving the cylinder a movement corresponding to the rate of movement of the car or carrier, stopping device, a normally stationary piston in the cylinder, means whereby the cylinder causes a movement of the piston when the movement of the cylinder exceeds the normal rate, and means whereby the piston throws the stopping device into action, substantially as described.

7. In a safety appliance, the combination with a car or carrier, of a liquid-containing cylinder mounted thereon, means for giving the cylinder a movement corresponding to the rate of movement of the car or carrier, a piston located in the cylinder, means for permitting the circulation of the liquid from one side of the piston to the other, said means being constructed to allow the passage of a definite amount of liquid, whereby the piston remains stationary when the cylinder is moving at a normal rate but is caused to move when the movement of the cylinder exceeds the normal rate, stopping device, and means whereby the movement of the piston throws the stopping device into action, substantially as described.

the normal rate, stopping device, and means whereby the movement of the piston throws the stopping device into action, substantially as described.

8. In a safety appliance, the combination with a car or carrier, of a liquid-containing cylinder mounted thereon, means operated by the movement of the car or carrier for giving the cylinder a movement corresponding to the rate of movement of the car or carrier, a piston located in the cylinder, means for permitting the circulation of the liquid from one side of the piston to the other, said means being constructed to allow the passage of a definite amount of liquid, whereby the piston remains stationary when the cylinder is moving at a normal rate but is caused to move when the movement of the cylinder exceeds the normal rate, stopping device, and means whereby the movement of the piston throws the stopping device into action, substantially as described.

9. In a safety appliance, the combination with a car or carrier, of a liquid-containing cylinder mounted thereon, means operated by the movement of the car or carrier for giving the cylinder a movement corresponding to the rate of movement of the car or carrier, a normally stationary piston located in the cylinder, a valve-controlled by-pass leading from one side of the piston to the other, said by-pass being constructed to allow the circulation of a definite amount of liquid, whereby the piston remains stationary when the cylinder is moving at a normal rate but is caused to move when the movement of the cylinder exceeds the normal rate, stopping device, and means whereby the movement of the piston throws the stopping device into action, substantially as described.

10. In a safety appliance, the combination with a car or carrier, of a liquid-containing cylinder mounted thereon, means operated by the movement of the car or carrier for giving the cylinder a movement corresponding to the rate of movement of the car or carrier, stopping device, a locking mechanism for rendering the stopping device normally inoperative, and means actuated by the cylinder when its movement exceeds the normal rate for releasing the locking mechanism, substantially as described.

11. In a safety appliance, the combination with a car or carrier, of a liquid-containing cylinder mounted thereon, means operated by the movement of the car or carrier for giving the cylinder a movement corresponding to the rate of movement of the car or carrier, a normally stationary piston located in the cylinder, means whereby when the movement of the cylinder exceeds its normal rate the piston is moved, stopping device, a locking mechanism for rendering said stopping device normally inoperative, and connections between the piston and the locking device, whereby the movement of the piston releases the locking mechanism and throws the stopping device into operation, substantially as described.

12. In a safety appliance, the combination with a car or carrier, of a liquid-containing cylinder mounted thereon, means operated by the movement of the car or carrier for giving the cylinder a movement corresponding to the rate of movement of the car or carrier, a piston, a valve-controlled by-pass leading from one side of the piston to the other, said by-pass being constructed to allow the circulation of a definite amount of liquid, whereby the piston remains stationary when the cylinder is moving at a normal rate but is caused to move when the movement of the cylinder exceeds the normal rate, stopping device, locking mechanism therefor for rendering the stopping device normally inoperative, and connections between the piston and the locking mechanism whereby the movement of the piston releases the locking mechanism, substantially as described.

13. In a safety appliance, the combination with a car or carrier, of a liquid-containing cylinder supported thereon, a shaft also supported thereon, means whereby the movement of the car or carrier causes the rotation of the shaft, connection between the shaft and the cylinder, whereby the rotation of the shaft causes a movement of the cylinder, a piston located in the cylinder, a valve-controlled by-pass leading from one side of the piston to the other, said by-pass being constructed to allow the circulation of a definite amount of liquid, whereby the piston remains stationary when the cylinder is moving at a normal rate but is caused to move when the movement of the cylinder exceeds the normal rate, stopping device, locking mechanism therefor for rendering the stopping device normally inoperative, and connections between the piston and the locking mechanism whereby the movement of the piston releases the locking mechanism, substantially as described.

14. In a safety appliance, the combination with a car or carrier, of a liquid-containing cylinder mounted thereon, a cable located alongside the path of movement of the car or carrier, a shaft mounted on the car or carrier, a pulley on the shaft around which the cable passes, gearing between the shaft and the cylinder, a piston located in the cylinder, a valve-controlled by-pass leading from one side of the piston to the other, said by-pass being constructed to allow the circulation of a definite amount of liquid, whereby the piston remains stationary when the cylinder is moving at a normal rate but is caused to move when the movement of the cylinder exceeds the normal rate, stopping device, locking mechanism therefor for rendering the stopping device normally inoperative, and connections between the piston and the locking mechanism whereby the movement of the piston releases the locking mechanism, substantially as described.

nection between the piston and the locking mechanism whereby the movement of the piston releases the locking mechanism, substantially as described.

15. In a safety appliance, the combination with a car or carrier, of a cylinder mounted thereon, means operated by the movement of the car or carrier for giving the cylinder a movement corresponding to the rate of movement of the car or carrier, stopping device, locking mechanism including a slide for rendering the stopping device normally inoperative, and means actuated by the movement of the cylinder for moving the slide and releasing the stopping device, substantially as described.

16. In a safety appliance, the combination with a car or carrier, of a liquid-containing cylinder mounted thereon, means operated by the movement of the car or carrier for giving the cylinder a movement corresponding to the rate of movement of the car or carrier, a piston located in the cylinder, a valve by-pass leading from one side of the piston to the other, said by-pass being constructed to allow the circulation of a definite amount of liquid whereby the piston remains stationary when the cylinder is moving at a normal rate but is caused to move when the movement of the cylinder exceeds the normal rate, stopping device, locking mechanism including a slide for rendering the stopping device normally inoperative, and means actuated by the movement of the piston for moving the slide and releasing the stopping device, substantially as described.

17. In a safety appliance, the combination with a car or carrier, of a cylinder mounted thereon, means for giving the cylinder a movement corresponding to the rate of movement of the car or carrier, stopping device located on each side of the car or carrier, a normally stationary piston located in the cylinder, means actuated by the cylinder when its movement exceeds the normal rate for operating the piston, and connections between the piston and the stopping devices whereby the movement of the piston throws the stopping devices into operation, substantially as described.

18. In a safety appliance, the combination with a car or carrier, of a cylinder mounted thereon, means for giving the cylinder a movement corresponding to the rate of movement of the car or carrier, stopping devices located on each side of the car or carrier, locking mechanism for rendering said stopping devices normally inoperative, a normally stationary piston located in the cylinder, means actuated by the cylinder when its movement exceeds the normal rate for operating the piston, and connections between the piston and the locking mechanism whereby the movement of the piston releases the locking mechanism, substantially as described.

19. In a safety appliance, the combination with a car or carrier, of a liquid-containing cylinder mounted thereon, means for giving the cylinder a movement corresponding to the rate of movement of the car or carrier, a piston located in the cylinder, a valve by-pass leading from one side of the piston to the other, said by-pass being constructed to allow the circulation of a definite amount of liquid whereby the piston remains stationary when the cylinder is moving at a normal rate but is caused to move when the movement of the cylinder exceeds the normal rate, stopping device located on each side of the car or carrier, locking mechanism for rendering said stopping devices normally inoperative, and connections between the piston and the locking mechanism whereby the movement of the piston releases the locking mechanism, substantially as described.

20. In a safety appliance, the combination with a car or carrier, of a liquid-containing cylinder mounted thereon, means for giving the cylinder a movement corresponding to the rate of movement of the car or carrier, a normally stationary piston located in the cylinder, a valve by-pass, two sets of stopping devices, one located on each side of the car or carrier, a locking mechanism for each set of stopping devices, and locking mechanism including a slide, and a connecting-rod extending from each side of the piston to the slide whereby a movement of the piston operates the slide and releases the stopping devices, substantially as described.

21. In a safety appliance, the combination with a car or carrier, of a stopping device, locking mechanism including a slide for holding said device inoperative, means for holding the slide in operative position, and means including a liquid-containing cylinder for operating the slide to release the locking device, substantially as described.

22. In a safety appliance, the combination with a car or carrier, of a stopping device, locking mechanism including a slide for holding said device inoperative, means for holding the slide in operative position, a liquid-containing cylinder mounted on the car or carrier, means for giving the cylinder a movement corresponding to the rate of movement of the car or carrier, a normally inoperative piston located in said cylinder, connections between the piston and the slide, and means actuated by the cylinder when its movement exceeds the normal rate for moving the piston, substantially as described.

23. In a safety appliance, the combination with a car or carrier, of a stopping device, locking mechanism including a slide for holding said

device inoperative, means for holding the slide in operative position, a liquid-containing cylinder mounted on the car or carrier, means for giving the cylinder a movement corresponding to the rate of movement of the car or carrier, a normally inoperative piston located in said cylinder, a valve by-pass, connections between the piston and the slide, and means actuated by the cylinder when its movement exceeds the normal rate for moving the piston, substantially as described.

24. In a safety appliance, the combination with a car or carrier, of a liquid-containing cylinder mounted thereon, a shaft also mounted thereon, gearing between the shaft and the cylinder, a cable located alongside the path of movement of the cylinder, a pulley on the shaft around which said cable passes, a normally stationary piston located in said cylinder, a valve by-pass, a set of stopping devices on each side of the car or carrier, said sets including normally inoperative catches, a locking mechanism for each set of stopping devices, each of said locking mechanisms including a slide, counterweighted levers for holding the slides in operative position, a rod connected to the piston and the slides whereby the movement of the piston moves the slides and releases the locking mechanisms, substantially as described.

25. In a safety appliance, the combination with a car or carrier, of a liquid-containing cylinder, means for giving the cylinder a movement, a normally stationary piston located in the cylinder, a perforated rod extending through the cylinder-head, stopping devices, an indicator-cup, and a pipe connecting the cup with the perforation in the rod, substantially as described.

26. In a safety appliance, the combination with a car or carrier, of a liquid-containing cylinder mounted thereon, means for giving the cylinder a movement corresponding to the rate of movement of the car or carrier, a normally stationary piston located in the cylinder, a perforated rod extending from opposite sides of the piston and passing through the cylinder-head, stopping devices, connections between the rod and the stopping devices, indicator-cups, and pipes connecting the cups with the perforation in the rod, substantially as described.

699,086. SUIZ-SOLIDER. HOTT & TAMM, Canton, Pa., assignors to Alvin H. Lohr and William H. Moore. Filed Mar. 3, 1901. Serial No. 69,504. (No model.)

Claim.—1. In combination with parallel sections, a spring having its ends bent at an angle to the body of the same, said ends being normally inclined in relation to each other, means for causing said spring to said sections in such manner that the spring will lie between the same, and means for causing one of said spring ends to each of said sections and for holding the inclined ends in parallel relation to each other, substantially as described.

2. In combination with parallel sections, a spring having its ends bent at an angle to the body of the same, said ends being normally inclined in relation to each other, pockets in said sections for the reception in each of the same of one of said spring ends, and means for holding said spring between said sections and for securing the spring to said sections, substantially as described.

3. In combination with a spring having its ends bent at an angle to the body of the same, said ends being normally inclined in relation to each other, two parallel sections having pockets formed in the upper edge of the same for the reception in each of the same of one of said spring ends, and staples for securing said spring to said sections by attaching to each of the jaws that end of the spring which engages with the opposite jaw, substantially as described.

4. In combination with a spring having its ends bent at an angle to the body of the same, said ends being normally inclined in relation to each other, two parallel sections having pockets formed in the upper edge of the same and the wall of said pockets partly cut away on the inner surface of the sections, said pockets serving for the reception in each of the same of one of said spring ends, and staples for securing said spring to said sections by attaching to each of the jaws that end of the spring which engages with the opposite jaw, substantially as described.

699,087. LEAF-TURNER. JOHN TAYLOR, Leamington, England. Filed Nov. 10, 1891. Serial No. 62,222. (No model.)

Claim.—1. In a leaf-turner or paper-lifter, the combination of a frame, a rack-shaft supported thereon, an arm formed of two pivotally-connected parts secured at one end to the shaft and having an expanding chamber on its free end, a cord, one end of which is secured to the arm intermediate its pivotal joint and the expanding chamber and its other end being secured to the frame at a point above the arm on the same side of the shaft as that in which the arm lies when in its inoperative position, means adapted to be actuated by the operator to rotate the arm in one direction through one-half of a revolution and automatic means to return the arm, substantially as and for the purpose specified.

2. In a leaf-turner or paper-lifter and in combination, a frame, a rack-shaft supported thereon, an arm formed of two pivotally-connected parts, fixed by one end to the shaft and having an expanding chamber on its free end, a cord one end of which is secured to the arm intermediate its pivotal joint and the expanding chamber while its other end is secured to the frame at a point above the arm on the same side of the shaft as that in which the arm lies when in its inoperative position, a bevel-wheel on the shaft gearing with a bevel-wheel supported on the frame, an operating lever or handle fixed on the base of the latter wheel and a spring engaging the handle to return the same to normal position after movement by the operator substantially as specified.

3. In a leaf-turner or paper-lifter and in combination, a frame, a rack-shaft supported thereon, an arm formed of two pivotally-connected parts, fixed by one end to the shaft and having an expanding chamber on its free end, a cord one end of which is secured to the arm intermediate its pivotal joint and the expanding chamber while its other end is secured to the frame at a point above the arm on the same side of the shaft as that in which the arm lies when in its inoperative position, a bevel-wheel on the shaft gearing with a bevel-wheel supported on the frame, an operating lever or handle fixed on the base of the latter wheel, a spring engaging the handle to return the same to normal position after movement by the operator and a leaf-flap catch as F carried on a bevel wheel gearing with a second bevel-wheel carried on the shaft and substantially as specified.

699,088. MULTIPLE EFFLUENT. BERNARD TOWN, New Orleans, La. Filed Apr. 27, 1901. Serial No. 67,512. (No model.)

Claim.—1. In an apparatus of the character described, the combination with an evaporator divided into a plurality of chambers with heating devices in the lower portion of each of said chambers, of a pipe connecting the lower portions of each pair of said chambers, and another pipe connecting the upper portions of each pair of said chambers, means for supplying the liquid to be concentrated to one of said chambers, and means for drawing off the vapor from another of said chambers, substantially as described.

2. A separator for use in an apparatus of the character described, comprising a base-plate and a plurality of hollow-plates *f, f'* and *f''* projecting upward from said base-plate and arranged to form tortuous passages to permit the passage of the vapor therethrough, but to arrest any condensed liquid, the said separator being arranged in the upper portion of the evaporating-chamber, substantially as described.

3. In an apparatus of the character described, the combination with an evaporator divided into a plurality of superimposed chambers, with a heating-drum in the lower portion of each of said chambers, means for

supplying the liquid to be concentrated in the lowest or said chambers, and means for drawing off the vapor from the highest of said chambers, pipes connecting adjacent chambers above and below the liquid, respectively, and a reducing-valve in the pipe connecting the chambers above the liquid, substantially as described.

4. In an apparatus of the character described, the combination with an evaporator divided into a pair of chambers with heating devices in the lower portion of each of said chambers, of a pipe connecting the lower portions of each pair of said chambers, and another pipe connecting the upper portions of each pair of said chambers, means for supplying the liquid to be concentrated to the lower one of said chambers, and means for drawing off the vapor from the top of the upper one of said chambers, substantially as described.

5. In an apparatus of the character described, the combination with an evaporator divided into a plurality of chambers with a heating-drum below in the center and provided with a series of water-lugs, located in the lower portion of each of said chambers, and steam or vapor lines opening upward into the hollow central portion of said drums, of pipes connecting said chambers, with a reducing-valve in one of said pipes, means for supplying the liquid to be concentrated to one of said chambers, and means for drawing off the vapor from another of said chambers, substantially as described.

6. In an apparatus of the character described, the combination with an evaporator divided into a plurality of chambers with a heating-drum below in the center and provided with a series of water-lugs, located in the lower portion of each of said chambers, and steam or vapor lines opening upward into the hollow central portion of said drums, means for supplying the liquid to be concentrated to the lowest of said chambers, and means for drawing off the vapor from the highest of said chambers, pipes connecting adjacent chambers above and below the liquid, respectively, and a reducing-valve in the pipe connecting the chambers above the liquid, substantially as described.

699,089. DUMPING DEVICE. BERNARD F. THOMAS, London, Eng. Filed Feb. 5, 1902. Serial No. 68,795. (No model.)

Claim.—1. In a dumping device, the combination with a receptacle having converging walls which form a discharge-outlet, of a plate adapted to open and close said outlet and a bifurcated operating-lever fixed to said plate at opposite sides of its center and provided to suitable supports.

2. In a dumping device, the combination with a receptacle having converging walls which form a discharge-outlet, of a plate adapted to open and close said outlet and a bifurcated operating-lever fixed to said plate at opposite sides of its center and detachably pivoted to suitable supports.

3. In a dumping device, the combination with a receptacle having converging walls which form a discharge-outlet, of a plate adapted to open and close said outlet, a lever pivoted to said plate at opposite sides of its center and pivoted to said brackets.

4. In a dumping device, the combination with a receptacle having converging walls and a triangular central rib which form discharge-outlets, of a plate adapted to open and close said outlets and bifurcated operating-levers fixed to said plate at opposite sides of their centers and pivoted to suitable supports, having the handle of one adapted to pass between the forks of the other.

699,040. SPEED-CONTROLLER. FRANK THIER, Brunswick, Germany. Filed July 1, 1901. Serial No. 66,777. (No model.)

Claim.—1. In mechanism for controlling rotary or rectilinear motion the combination with a moving part having a grooved path of a lever *a* a roller *b* thereon which passes through said path when the moving part is traveling at the normal speed, a projection or bridge over each grooved path upon which the roller is caused to mount, when the normal speed is exceeded, and means whereby the motion thus imparted to the lever is caused to effect the retardation of the moving part, substantially as described.

2. In mechanism for controlling rotary or rectilinear motion the combination with a moving part having a grooved path, of a lever *a*, a roller *b* thereon which passes through said path when the moving part is traveling at the normal speed, a projection or bridge over each grooved path upon which the roller is caused to mount when the normal speed is exceeded, and means whereby the motion thus imparted to the lever is caused to operate a signaling device, substantially as described.

3. In mechanism for controlling rotary or rectilinear motion the combination with a moving part having a grooved path of a lever *a* a roller *b* thereon which passes through said path when the moving part is traveling at the normal speed, a projection or bridge over each grooved path upon which the roller is caused to mount, when the normal speed is exceeded, and means whereby the motion thus imparted to the lever is caused to effect the retardation of the moving part and to operate a signaling device, substantially as described.

4. In mechanism for controlling rotary or rectilinear motion the combination with a moving part having a grooved path of a lever *a* a roller *b* thereon which passes through said path when the moving part is traveling at the normal speed, a projection or bridge over each grooved path upon which the roller is caused to mount, when the normal speed is exceeded, and means whereby the motion thus imparted to the lever is caused to operate a signaling device, substantially as described.

5. In mechanism for controlling rotary or rectilinear motion the combination with a moving part having a grooved path of a lever *a* a roller *b* thereon which passes through said path when the moving part is moving at the normal speed, a projection or bridge over each grooved path upon which the roller is caused to mount when the normal speed is exceeded, and means whereby the motion thus imparted to the lever is caused to move a brake-block into contact with the moving part, substantially as described.

6. In mechanism for controlling rotary or rectilinear motion the combination with a moving part having a grooved path of a lever *a* a roller *b* thereon which passes through said path when the part is traveling at the normal speed, a projection or bridge over each grooved path upon which the roller is caused to mount when the normal speed is exceeded, and means whereby the motion thus imparted to the lever is caused to move a brake-block into contact with the moving part and close an electric signaling-circuit, substantially as described.

7. The combination with a spring body having a curved groove or path and a bridge-piece projecting over said path and having inclined ends,

of a rest-shaft journaled in fixed bearings, a lever projecting therefrom, a roller on said lever, a second lever on the rest-shaft, an elbow-lever, a brake-block on one arm thereof and a spring connected to the second lever of the rest-shaft and the other arm of the elbow-lever, substantially as described.

8. The combination with a moving body having a curved groove or path and a bridge-piece projecting over said path and having inclined ends, of a rest-shaft journaled in fixed bearings, a lever projecting therefrom, a roller on said lever, a second lever on the rest-shaft, an electric signaling-circuit, and a circuit-closer therefor in the path of movement of the second lever, substantially as described.

699,041. TRAP-NET. JOHN C. THOMPSON, Hampton, Ga. Filed Feb. 12, 1902. Serial No. 64,082. (No model.)

Claim.—1. A trap-net for fish, the same consisting of a body portion of wire-netting, bent to form a body portion elliptical in cross-section and having a flaring or bell-shaped entrance, in combination with one or more pringles, within the body portion, substantially as described and for the purpose specified.

2. A trap-net consisting of a body portion of wire-netting devoid of hoops, frames or other strengthening devices, the said body portion being elliptical in cross-section and having a flaring or bell-shaped entrance, in combination with one or more pringles made of wire-netting, said pringles being secured within the body portion and having at their contracted inner ends members or passages normally held closed by the tension of the wire, substantially as described.

699,042. WINDOW-WASHER. JAMES VAIR, Detroit, Mich. Filed May 20, 1901. Serial No. 61,615. (No model.)

Claim.—1. A window-washing apparatus, comprising in its construction a rod, a tube telescoping thereover, means for securing the free ends of said rod and tube against the vertical sides of a window-sash, a rod slidably secured above said tube and arranged parallel therewith, a vertically-arranged rod slidably secured to said parallel rod, a sleeve slidably secured to said vertical rod, a cleaning instrument carried by said sleeve, and means for suspending said cleaning instrument, substantially as described.

2. A window-washing apparatus, comprising a telescoping support, a horizontal rod slidably secured to said support and spaced above the same, a sleeve vertically arranged and slidably carried by the horizontal rod, means for securing the horizontal rod out of its vertical plane, and window-cleaning means carried by said vertical rod, substantially as described.

3. A window-washing apparatus comprising in its construction a longitudinally-adjustable rod adapted to be secured between the vertical sides of a window-sash, a sleeve slidably thereover, a rod spaced therefrom and extending parallel therewith, a sleeve rigidly secured about one end of said parallel rod, a web securing said rigid sleeve to said sliding sleeve, means supporting the free end of said parallel rod above said adjustable rod, a sleeve slidably upon said parallel rod, a vertical rod secured to said last-mentioned sleeve, means carried by said vertical rod for cleaning a window on the outside, a cushion secured to the upper end of said vertical rod, and auxiliary means for supporting said adjustable rod, substantially as described.

4. A window-washer comprising in its construction a rod adapted to be secured between the vertical sides of a window-sash, a rod slidably secured above said first-mentioned rod and extending parallel thereto, a sleeve longitudinally slidably upon said parallel rod, a vertically-arranged rod secured to said sleeve, means carried by said vertical rod for cleaning the outside of a window, and auxiliary means for supporting said vertical rod, comprising a spring pivoted near the lower end thereof, a foot upon the lower end of said spring adapted to normally rest upon said window-sash, a hub threaded through a flange extending from said sleeve, means for securing one end of said hub to said spring, and means for rotating said hub, whereby the pivoted end of said spring may be raised or lowered for tilting said vertical rod laterally, substantially as described.

5. A window-washer comprising in its construction a rod adapted to be supported vertically on the outside of a window, a telescoping support for said rod, a sleeve slidably upon said rod, means for suspending said sleeve, a tube carried by said sleeve, and carrying a cleaning instrument at its upper end, means for supplying water to the lower end of said tube, means for throwing water from said tube against the glass operated upon, a telescoping trough beneath said glass for receiving the drip therefrom, and means for conducting said drip from the trough back to the source of supply, substantially as described.

699,043. APPARATUS FOR THE HYDRAULIC PROPULSION OF SHIPS. LAM TUNG, N. Y. Filed Dec. 20, 1901. Serial No. 67,518. (No model.)

Claim.—1. An apparatus designed to counteract or to utilize the resistance of the water in the propulsion of ships whether navigating on the surface or beneath the surface of the water, and which apparatus consists essentially of a permanent or a removable casing or jacket surrounding the hull of the ship and perforated with a number of slots arranged at a short and symmetrical distance from the longitudinal median plane of the ship, and fitted with a pump or the means for supplying water continuously into the space between the hull and the outer casing; the water being drawn by the pump from a vertical hollow shaft placed in the center of the ship or through any other convenient opening in the ship or through a suction-cumulus projecting from the ship in the manner hereinafter described and for the purpose specified.

2. In combination with the hull of a vessel, a perforated casing surrounding the hull and spaced therefrom, and means for forcing water into the space.

3. In combination with the hull of a vessel, a casing in which the hull is arranged, the said casing having rearwardly-inclined openings, and a pump for supplying water to the casing.

4. In combination with the hull of a vessel, of a perforated casing in which the hull is arranged, a vertical pipe supported in the hull and having water-takes at its lower end, and a pump for discharging water from the pipe into the casing.

699,044. THRESHING-MACHINE. EDWARD J. FRANKLIN, Buffalo, N. Y., assignor to Buffalo Threshing Company, Buffalo, N. Y., a Corporation of New York. Filed Jan. 23, 1901. Serial No. 64,728. (No model.)

Claim.—1. The combination with the threshing-cylinder, the concave thereunder and the rearwardly-extended grate leading from the con-

curve, of the beating-drum mounted on a plane considerably above and in rear of the cylinder in such relation thereto that grain discharged by the latter will strike the lower portion of the drum and be freely deflected downward through the straw, a grate beneath said drum pivoted at one end, means for adjusting the position of said grate, said means extending forwardly of said grate in the line of the discharge of the straw carried by the beater of the drum, and mounted on the pivot-bearings of the grate, and means for adjusting said bearings and regulating the position of the feet, substantially as set forth.

2. The combination with the threshing-cylinder, the concave, the grate extending therefrom, of the beating-drum mounted on a plane considerably above and in rear of the cylinder in such relation thereto that grain discharged by the latter will strike the lower portion of the drum and be deflected downward, a grate located beneath the drum composed of spaced-apart cross-bars and end plates, pivot-bearings for the outer ends of said plates, screw-rods carried by said end plates, and means engaging said rods for locking said end plates in position, substantially as set forth.

3. The combination with the threshing-cylinder, the concave, and the grate leading therefrom, of the beating-drum mounted on a plane considerably above and in rear of the cylinder in such relation thereto that grain discharged by the latter will strike the lower portion of the drum and be deflected downward, a grate beneath the drum having end plates, a cross-rod upon which said end plates are pivoted, means for adjusting the position of said end plates, said means extending from said cross-rod, and means engaging one end of the latter for adjusting the position of the feet, substantially as set forth.

699,045. SAFETY FUSE-BOX. JAMES T. WATSON, Scranton, Pa. Filed July 8, 1901. Serial No. 67,494. (No model.)

Claim.—1. In a safety fuse-box, the combination with an insulating case, a pair of steps connected in the line-circuit mounted therein, an electro-magnet adapted to operate said steps, and a pair of contacts connected in said magnet-circuit carried by said case; of a plurality of separate fuse-holders mounted in said case, conducting-plugs normally in engagement with said steps, and pins electrically connected together, and slidably mounted in said holders, adapted to engage said contacts in said case when the fuse is blown out, substantially as described.

2. In a safety fuse-box, the combination with an insulating case, a pair of steps connected in the line-circuit mounted therein, an electro-magnet adapted to operate said steps, and a pair of contacts connected in said magnet-circuit carried by said case; of a plurality of separate fuse-holders, a fuse within each of said holders, sliding pins each connected to said fuse, insulated ends upon said pins, springs in connection with said insulated ends, electrical connection between said springs, said portions being adapted to complete the magnet-circuit through said contacts in said case, substantially as described.

case when the fuse blows out, and conducting-plates upon the under side of said holders adapted to rest upon said steps, through which the line-current passes to the fuse, whereby when the fuse is blown out, the circuit is completed through the magnet, withdrawing said steps, causing the blown-out fuse-holder to be ejected, allowing the next holder to drop into place, substantially as described.

3. In a safety fuse-box, the combination with an inclosing case, a pair of steps connected in the line-circuit mounted therein, an electromagnet adapted to actuate said steps, and a pair of contacts connected in said magnet-circuit, carried by said case; of a plurality of fuse-holders each independently movable in said case, said holders being adapted to rest upon said steps, fuses carried by said holders, each fuse being adapted to be thrown into the circuit when its holder rests upon said steps, and sliding pins adapted to engage the electrical contacts of said case when the fuse blows out, to complete the circuit through the magnet, causing the case to withdraw the steps, allowing the next fuse-holder to drop into place, substantially as described.

4. In a safety fuse-box, the combination with an inclosing case, a pair of steps connected in the line-circuit mounted therein, an electromagnet adapted to actuate said steps, and a pair of contacts connected in said magnet-circuit, also carried by said case; of a plurality of fuse-holders mounted in said case, plates upon the under side of each said holder, adapted to rest upon said steps, and fuses in connection with said plates, and spring-actuated pins carried by said holders, whereby when said fuse blows out, said pins are sprung into contact with said electrical contacts, closing the magnet-circuit, causing said magnet to withdraw said steps and allow the remaining holder to drop into place, substantially as described.

5. A safety fuse-holder, comprising an insulating-base, conducting-plates upon each end of said base, sliding pins adapted to carry a fuse mounted in said base, in electrical connection with said conducting-plates, insulated couplings carried by said pins, springs normally tending to throw said pins outwardly, and electrical connection between said springs, whereby when said fuse is blown out, said springs are thrown outwardly, substantially as described.

699,046. JAR CLOSURE AND FASTENER. EMERY F. WINE, Oudersport, Pa., assignor, by direct and mesne assignments, of one half to WILLIAM A. WINE and W. H. RICHARDS, Oudersport, Pa. Filed Nov. 8, 1901. Serial No. 11,313. (No model.)

Claim.—1. In combination with a jar or like receptacle having an outer rib or flange at its upper end, a closure for the said receptacle having oppositely-disposed cam portions upon its outer or top side and interlocking means between the receptacle and closure to prevent turning of the latter, a fastener of ball form having bent terminal portions to engage under the aforementioned rib and adapted to have its horizontal portion ride upon the aforementioned cam portions of the closure, substantially as set forth.

2. In combination, a jar or like receptacle having an outer rib or flange at its upper end and having notches in said flange at diametrically opposite points, a closure having oppositely-disposed cam portions upon its outer or top side, interlocking projections forming a part of the closure and adapted to enter the aforementioned notches when the closure is in place, and a fastener of ball form provided with bent terminals to pass through the notches of the aforementioned rib and adapted to have its horizontal portion ride upon the cam portions of the closure, substantially as specified.

3. In combination, a jar or like receptacle having an outer rib or flange at its upper end and notched at diametrically opposite points, a closure having interlocking projections to enter the said notches of the rib and having a pair of centrally-disposed studs upon its outer or top side and having oppositely-disposed cam portions, and a fastener of ball form having its horizontal portion fitted between the said studs and adapted to have its bent terminals pass through the notches of the aforementioned rib and engage under the latter, substantially as set forth.

699,047. APPARATUS FOR CHARGING AND DISCHARGING LIQUIDS. CHAS. A. WILLIAMS, Worcester, Mass. Filed Apr. 6, 1901. Serial No. 94,981. (No model.)

Claim.—1. An apparatus for carbonating liquids, comprising a casing, a reservoir in the casing, a mixing-chamber mounted on the reservoir communicating directly therewith, a dome mounted on the mixing-chamber and communicating directly therewith, an injector-nozzle leading into

the dome, a gas-supply pipe connected to the nozzle, a valve commanding the gas-supply pipe, a liquid-pipe leading into the dome transversely to the nozzle, and a valve commanding the liquid-pipe.

2. An apparatus for carbonating liquids, comprising a casing, a reservoir therein, means extending outside of the casing for withdrawing the liquid therefrom, a mixing-chamber mounted on and directly communicating with the upper part of the reservoir and within the casing, a dome on the mixing-chamber and communicating directly therewith, an injector-nozzle leading into the dome, a gas-supply pipe connected to the nozzle, a valve commanding the gas-pipe, a water-pipe coiled in the casing and leading to the dome transversely of the injector-nozzle, and a valve commanding the water-pipe.

3. An apparatus for carbonating liquids, comprising a reservoir having a perforated top portion, a mixing-chamber mounted on the reservoir at the perforated part thereof, said perforated part of the reservoir constituting the bottom of the mixing-chamber, a dome mounted on the mixing-chamber and communicating directly therewith, an injector-nozzle leading into the dome, a valve-controlled gas-supply communicating with the nozzle, and a valve-controlled liquid-supply communicating with the dome.

4. An apparatus for carbonating liquids, consisting of a casing, a reservoir in the casing and provided with a pipe leading therefrom out through the casing, said pipe being provided with a cock, a mixing-chamber on the top of the reservoir and communicating therewith, a dome on the mixing-chamber, an injector in the dome, a valve-casing in the inclosing casing and connected with the injector, a valve in the casing and having its stem leading out through the inclosing casing, a gas-supply connected with the valve-casing, a second valve-casing in the inclosing casing and connected with the upper part of the dome, a valve in the said casing and having its stem extending out through the inclosing casing, and a water-supply pipe coiled in the inclosing casing and connected with the valve-casing, substantially as described.

699,048. RAIL CHAIR OR SUPPORT. ELMER H. WILLIAMS, Fitzgerald, Ga. Filed Dec. 12, 1901. Serial No. 94,982. (No model.)

Claim.—The combination with a rail-joint and three or more the having aligned recesses on their upper surfaces, of a chair or support consisting of an oblong plate, the upper and lower surfaces and the sides of which are plane, said plate being seated in the recesses in the ties with its upper surface flush with the upper surface of the ties and of a bracket

greater than the base of the rail, and fastening means for fastening the rail to the chair or support and the chair or support to the tie, substantially as set forth.

699,049. TIP-PRINTING PRESS. JAMES F. WILLIAMS, West Orange, N. J., assignor to the New Man Printing Machine Company, a Corporation of New Jersey. Filed Jan. 26, 1901. Serial No. 94,983. (No model.)

Claim.—1. In a printing or embossing press having a die-bed and a movable die adapted to normally lie away from the die-bed, a stationary lower member comprising a tube located at one side of the path of movement of the die substantially parallel to the face of said die and having gas-perforations in its side next said die, and means for supporting said tube and permitting turning of the same on its longitudinal axis.

2. In a printing or embossing press, having a die-bed and reciprocating die presenting an extended imprinting-surface, a lower member adjacent to the path of movement of said die, between its opposite limits of movement, and comprising a tube having gas-perforations in its side, and supporting means holding said tube but permitting rotation on its longitudinal axis, whereby adjustment may be had to direct the stream of air against the face of the die.

3. In a printing or embossing press having a die-bed and a die adapted to move toward and away from said die-bed, a burner comprising a tube arranged at one side of the path of the die substantially parallel to its face and having a lateral gas-discharge opening, supporting means for said tube adapted to permit it to turn on its longitudinal axis, and means for clamping the tube in any desired position.

4. In a press, the combination of a frame providing a slideway, *d*, with cam *d'*, at one end of said slideway, a plunger *e*, adapted to reciprocate in said slideway, and having a cross-piece *e'*, at the end opposite from the said cam on the slideway, guide-rods *f*, extending between said cam and cross-piece parallel to the plunger and flat at one end to one of said parts and sliding at the other end through the opposite part, and spiral springs on said rods bearing at one end against that part through which the rods slide and ends curving on said rods to form adjustable stops for the other ends of the springs, substantially as set forth.

5. In a press, the combination with a frame providing a vertical front, of an independent die-bed support or bracket adapted at its rear wall to lie against the front of the frame, the contacting surfaces of said frame and bracket having cooperating means for forming a separable connection from which the bracket may be released by moving upward with respect to the frame, substantially as set forth.

6. In a printing or embossing press, the combination with a frame providing at its lateral edges inwardly-bent and upwardly-converging flanges and at its rear having a stop *g*, of a die-bed support or bracket having at its rear a vertical recess or groove adapted to receive the front of the frame and inward side walls to engage the bent flanges of said frame, the lower end of the support being adapted to engage the stop *g*, when said support engages at the side walls of its rear recess the flanges of the frame a die-bed having a stem entering the recess, and an adjusting-screw working through the bottom of the recess to regulate the height of the die-bed, substantially as set forth.

7. In a press, the combination with a frame presenting at its free lateral and upwardly-converging flanges, of a die-bed support or bracket having at its rear a vertical recess or groove adapted to receive the frame and having overhanging side walls to engage the said lateral flanges of the frame, and a stop preventing undue wedging of the support upon its end on the frame, substantially as set forth.

8. The combination with a printing or stamping press having a vertical frame *a*, of a die-bed comprising a lower member held in fixed position close to said frame, an upper member adapted to lie readily upon said lower member and being slidably connected thereto, and arms or extensions at the inner end of said upper member which normally lie on opposite sides of the frame *a*, and which curve to extend the slidable connection of the upper and lower members so that the upper member can be slid out from said frame *a*, beyond the lower member.

9. In a printing or stamping press having a coated die-bed support or bracket, a separable or removable die-bed comprising a lower member having a stem *a*, adapted to enter the said coated support or bracket, and an upper member adapted to lie upon the lower member and slide in its own plane with respect thereto for a limited distance.

10. The herein-described die-bed for a tip-printing press, comprising upper and lower plates or members *c, c'*, forming at their contacting surfaces a close-fitting joint, means upon the lower member for holding it in fixed position beneath the die depending lateral flanges upon the upper member engaging the side edges of the lower member and being extended beyond the end of the upper member to permit said member to be slid entirely off the lower member, stops limiting relative sliding of the members, and spring-clips on the upper member for grasping the article to be printed, substantially as set forth.

11. In a printing or embossing press, having a frame *a*, a die-bed support comprising a lower fixed member of greater width than said frame, and an upper slidable member having its side edges depending over and engaging the edges of the lower member, said side edges being extended rearward beyond the lower member.

699,050. FASTENER FOR COLLARS. GEORGE H. WILSON, Louisville, Ky. Filed Jan. 11, 1902. Serial No. 94,984. (No model.)

Claim.—1. In a collar-fastener, a strip having a hook at one end and in combination with a collar provided with a loop attached thereto the loop serving to receive said strip, and the end of the collar carrying said loop, being notched.

2. In a collar-fastener, the combination of a collar provided with a loop, and a strip adapted to be slipped through said loop, the inner end of the strip having a bent-over portion adapted to engage the outer face of the loop, and the outer end of the strip having an open hook, said strip being detachably held in place by the bent-over end engaging the loop.

699,051. STAMPING-MACHINE. EDWARD L. WILSON, Baltimore, Md., assignor to Charles Howard Beck, Baltimore, Md. Filed Jan. 21, 1902. Serial No. 99,611. (No model.)

Claim.—1. In a stamping-machine, the combination of a die-punch; a disk-holder mounted to be revolved and provided with a plurality of circumferential notches; a reciprocating slide provided with a wedge; a pawl carried by said slide and adapted to engage the notches on said holder; and a belt spring-pressed into engagement with said notches to lock the disk-holder in a stationary position and arranged to be engaged by the wedge of the slide, whereby to withdraw said belt from the notches against the action of its spring.

2. In a stamping-machine, the combination of a die-punch; a disk-holder mounted to be revolved below said die, said holder having a plurality of circumferential notches; a reciprocating slide; a pawl carried by said slide and adapted to engage the notches on said holder; a belt for engaging said notches to lock the disk-holder in a stationary position, and a wedge-block also carried by said slide for operating said belt.

3. In a stamping-machine, the combination of a die-punch; a disk-holder mounted to be revolved below said punch and provided with a plurality of circumferential notches; a reciprocating slide at the side of said disk-holder; means on said slide for revolving said disk-holder; a wedge-block also on said slide and reciprocating therewith; a belt for locking said disk-holder in a stationary position, said belt having a slot which receives the point end of said wedge-block whereby to withdraw the belt from engagement with the notches in the disk-holder.

4. In a stamping-machine the combination of a revolvable disk-holder having a plurality of circumferential notches; a slide at the side of said disk-holder; a wedge-shaped block on said slide and reciprocating therewith; a belt for locking said disk-holder in a stationary position, said belt extending acrosswise of the said slide and having in its bottom a slot which receives the point end of said wedge-block whereby the belt is drawn from engagement with the notches in the disk-holder, and a spring device for shearing the belt when the wedge-block has been withdrawn from the slot.

699,052. FILTER-PRESS. JOHN WILSON, Glasgow, Scotland. Filed Nov. 1, 1901. Serial No. 99,512. (No model.)

Claim.—1. In a filter-press, the combination with the stationary and the movable plates or followers of the press; of cake-forming frames

interposed between said plates or followers, inclined portions forming the bottoms of said frames, said portions supporting said frames, and means connected to said links adapted to give an angular or slanting position to said frames, when the plates are separated.

2. In a filter-press, the combination with the stationary and movable plates or followers; of cake-forming frames having inclined ends, interposed between said plates, links having holes of unequal lengths, pins carried upon the upper and lower ends of said plates and frames, said pins passing through the holes in said links, said links being so arranged that a slanting or oblique position is given to said frames when said plates are opened.

699,053. HYDROCARBON-BURNER. EDWARD WITTY, San Bernardino, Cal. Filed Oct. 10, 1901. Serial No. 73,901. (No model.)

Claim.—1. In a hydrocarbon-burner, a casing having front and rear chambers communicating with each other at the bottom, the front chamber having an open front end, an air and oil supply leading into the rear chamber at the bottom thereof, and a steam-supply leading into the rear chamber and discharging opposite the opening establishing communication between the said chambers, as set forth.

2. In a hydrocarbon-burner, a casing having the front and rear chambers communicating with each other at the bottom, the front chamber having an open front end, an air and oil supply leading into the rear chamber, an oil-supply vessel, and a steam-supply extending in front of the casing, thence through the oil-supply vessel and provided with a nozzle extending into the rear chamber opposite the opening establishing communication between the chambers, as set forth.

3. A hydrocarbon-burner, comprising a casing divided into two chambers, the front chamber having its front end open, and the rear one provided with a nozzle at its bottom, a steam-nozzle in the rear chamber opposite the front-chamber nozzle, an oil-supply for the rear chamber, an oil-supply for the said rear chamber, a steam-supply connected with the said steam-nozzle and passing through the oil-supply for heating the oil; and means for superheating the steam in the steam-supply previous to its passage through the oil-supply vessel and previous to its entrance into the burner, as set forth.

4. A hydrocarbon-burner, comprising a casing open at one end and having a transverse partition forming an oil and air chamber in the closed end thereof, said chamber being formed with a discharge-nozzle extending toward the open end of the casing at or near the bottom thereof, and a steam-nozzle in the said oil and air chamber and having its outlet close to the said discharge-nozzle of the said chamber, as set forth.

5. A hydrocarbon-burner, comprising a casing open at one end, an oil and air chamber in the closed end of the said casing and formed with a discharge-nozzle extending toward the open end of the casing at or near the bottom thereof, a steam-nozzle in the said oil and air chamber and having its outlet close to the said discharge-nozzle of the said chamber, a pipe opening into the said oil and air chamber, to conduct air and gas into the chamber, and a branch pipe leading from the said first-named pipe, for conducting air and gas into the casing in front of the said chamber, as set forth.

6. A hydrocarbon-burner, comprising a casing open at one end, and having a transverse partition forming an oil and air chamber in the closed end thereof, said chamber being formed with a discharge-nozzle extending toward the open end of the casing at or near the bottom thereof, a steam-nozzle in the said oil and air chamber and having its outlet close to the said discharge-nozzle of the said chamber, and a deflector in the open end of the casing and in advance of the said nozzle, to guide the mixture of air, gas and steam in an upward direction through the open end of the burner-casing, as set forth.

7. A hydrocarbon-burner, comprising a casing open at one end, an oil and air chamber in the closed end of the said casing and formed with a discharge-nozzle extending toward the open end of the casing at or near

the bottom thereof, a steam-nozzle in the said oil and air chamber and having its outlet close to the said discharge-nozzle of the said chamber, a deflector in the open end of the casing and in advance of the said nozzle, to guide the mixture of air, gas and steam in an upward direction through the open end of the burner-casing, and a burner-screen extending over the open end of the said casing, as set forth.

699,054. APPARATUS FOR DISPLAYING ADVERTISEMENTS. ROBERT J. WOOD, Glasgow, Scotland. Filed Apr. 25, 1902. Serial No. 714,282. (No model.)

Claim.—1. An apparatus for displaying advertisements, consisting of a framework, a set or sets of rollers mounted upon the front and back thereof, a series of hydraulic pistons and means engaging the same for rotating said rollers, and means whereby, as one set of rollers has completed its revolution the rotating mechanism is cut off from it and said set of rollers remains stationary, and means connecting the first and last set of rollers whereby the rollers are operated in succession as long as power is applied.

2. An apparatus for displaying advertisements consisting of a framework, a set or sets of rollers mounted upon the front and back thereof, a series of hydraulic pistons, each controlled by the other and lever connected to said pistons for rotating said rollers, whereby, as one set of rollers has completed its revolution, the rotating mechanism is cut off from it and immediately connected to the next set of rollers and means connecting the first and last set of rollers whereby the rollers are operated in succession as long as power is applied.

3. An apparatus for displaying advertisements consisting of a framework, a set or sets of rollers mounted upon the front and back thereof, a series of hydraulic pistons mounted above each other, mechanism engaging said pistons for rotating said rollers, means whereby, as one set of rollers has completed its revolution, the rotating mechanism is cut off from it, means for immediately connecting up the next set of rollers with the rotating mechanism until all the rollers have been operated, and means for connecting the first with the last set of rollers whereby the rollers are again rotated in succession as long as power is applied.

4. An apparatus for displaying advertisements consisting of a framework, a set or sets of rollers mounted upon the front and back thereof, hydraulic pistons having connection with each other, levers connected to the rods of said pistons, a valve for each piston-cylinder, connected with the said levers, and a connecting-rod connecting the top and bottom set of rollers whereby the rollers are operated in succession as long as water-power is applied.

699,055. ALTERNATING-CURRENT REGULATORS. THOMAS E. ADAMS, Cleveland, Ohio. Filed Dec. 1, 1901. Serial No. 94,285. (No model.)

Claim.—1. In a regulator, the combination of a solenoid, and means pivotally supporting the relative members of said solenoid with the weight of one part opposed to the weight of the other part.

2. A regulator, comprising an inductive resistance device having its parts relatively arranged to constitute mechanical resistance, one to the other.

3. A regulator, comprising a coil having its frame pivotally supported, and a core pivotally supported by the frame of the coil and adapted to enter the latter.

4. A regulator comprising a lever pivotally supported between its ends, a coil secured in one arm of said lever, and a core pivotally supported by the other arm of the lever and adapted to enter the coil.

5. A regulator, comprising a lever pivotally supported between its ends, a coil carried by one arm of said lever, and a core adapted to enter the coil, said core pivotally supported from the other arm of said lever at a point below the plane of the pivotal support of said lever.

6. The combination in an electric circuit, of transmitting devices included in said circuit, and an inductive-resistance device having its coils included in said circuit, the parts of said inductive resistance so relatively arranged that the mechanical resistance of one part to the pull of the other part will vary in proportion to the choking effect of the other part.

7. In an alternating-current regulator, the combination of a coil, a core to enter the coil, and means for causing one of said parts to exert a mechanical resistance to the pull of the other part commensurate with the choking effect produced in the coil when the resistance of an alternating-current circuit including said coil is varied.

8. In an electric regulator, the combination with a lever pivotally supported between its ends, of a segmental spool secured to one arm of said lever, a coil wound on said spool, and a core pivotally supported by the other arm of the lever and adapted to enter said coil.

9. In an electric regulator, the combination with a lever pivotally supported between its ends, a coil carried by one arm of said lever, a core pivotally supported by the other arm of said lever and adapted to enter said coil, and means for adjusting the fulcrum of said lever.

10. In an electric regulator, the combination with a lever pivoted between its ends, of a coil carried by one arm of said lever, a core pivotally supported by the other arm of the lever and adapted to enter the coil, and a bell-crank bearing against the arm of the lever carrying the coil.

11. In an electric regulator, the combination with a lever pivoted between its ends, a segmental spool secured to one arm of said lever, a series of coils on said spool and electrically connected together, opening-blocks between the coils and a core supported by the other arm of said lever and adapted to enter the coils.

12. In an electric regulator, the combination with levers or supports, a lever, a knife-edge bearing for the lever, secured to said supports, a coil carried by one arm of said lever, a core to enter the coil, a frame secured to said core, and a knife-edge bearing secured to the other arm of the lever, for said frame.

13. In an electric regulator, the combination with a support and a lever, of a plate secured to the support and having a knife-edge bearing for the lever, shoulders at the ends of said knife-edge for preventing lateral displacement of the lever, a coil carried by one arm of the lever, a core to enter the coil, a knife-edge bearing on the other arm of the lever

for supporting said core and means for preventing lateral displacement of the core relatively to its bearing.

14. In an electric regulator, the combination of a lever comprising two plates and a block secured to and supporting said plates, a knife-edge bearing for the block for pivotally supporting the lever, a coil carried by one arm of the lever, a knife-edge bearing secured to the ends of the plates constituting the other arm of the lever, and a core supported by said knife-edge bearing and adapted to enter the coil.

15. In an electric regulator, the combination of a lever comprising two plates and a block separating said plates, a pivotal support for said block means for adjusting the block to change the fulcrum of the lever, a coil carried by one arm of the lever and a core for the coil pivotally supported by the other arm of the lever.

16. In an electric regulator, the combination of a frame or lever having divergent members, a spool secured between said divergent members, a coil on said spool, means for pivotally supporting said frame or lever between the ends of one of its members, a frame or arm pivotally supported by said frame or lever at a point furthest removed from the spool and coil, and a core secured to said frame or arm and adapted to enter the coil.

17. In an electric regulator, the combination with a lever pivotally supported between its ends, of a segmental spool carried by one arm of said lever, a coil on said spool, and a core pivotally supported by the other arm of said lever, said core having two curved members, one to enter the spool and the other to move alongside the coil.

18. In a regulator, the combination of a frame or lever comprising two A-shaped plates and a block separating them, a spool secured at its ends to the convergent members of said plates, a coil on said spool, the cross-bar of said frame being split and connected together by insulating material to open the local circuit of the frame or lever, means engaging said block to pivotally support the frame or lever between its ends, and a core pivotally supported by said lever at a point furthest removed from the coil.

19. In an electric regulator, the combination with a non-magnetic core and a cover therefor, of an inductive-resistance device supported by the cover and depending within the core, and means on the cover for adjusting depending means.

20. In an electric regulator, the combination with a non-magnetic core containing oil, a cover on said core and a water-tight connection between the core and cover, of an inductive-resistance device supported by said cover and immersed in the oil in the core.

21. In an electric regulator, the combination with a core and cover therefor, of a lever pivotally supported between its ends at the center of the cover, a coil carried by one arm of said lever, and a core for the coil supported by the other arm of the lever, said cover having a hole for leading-in wire in close proximity to the pivotal support of said lever.

22. In an electric regulator, the combination with a lever pivotally supported between its ends, of a coil supported by one arm of said lever, a core pivotally supported by the other arm of the lever and adapted to enter said coil, an arm projecting from the lever, a dash-pot cylinder attached to the core, a valve plunger in said cylinder and a plunger-rod attached to said plunger and to the arm projecting from the lever.

699,056. TELEGRAPH-SOUNDER. JOHN A. ALSTON, Lancaster, Pa. Filed June 29, 1891. Serial No. 66,206. (No model.)

Claim.—1. In a telegraph instrument, the combination of a vibratory arm, a sounding-point located on said arm, a quander, and a spring-yielding back-stop-limiting point on said quander, substantially as specified.

2. In a telegraph instrument, a quander, a vibratory arm carrying a sounding-point, a sleeve of yielding material arranged in an opening in said quander, and a back-stop point for the arm supported in said sleeve, substantially as specified.

699,057. ADJUSTABLE FORM FOR SHIP-BUILDERS. CARL A. AMMERMAN, East Orange, N. J., assignor of one-half to Charles H. Shanger and Jesse R. Shanger. Filed Dec. 2, 1891. Serial No. 64,268. (No model.)

Claim.—1. The combination with the frame *a*, having longitudinally-slotted radiating arms provided with pins adjustable in the slots there-

of, of screws arranged in said pins, and a flexible form loosely connected to said screws, the said form being adapted to be changed in shape when the said screws are turned, substantially as set forth.

2. The combination with a frame having segments with curved slots of a flexible form over which wood may be bent, screws connected to said form and arranged in adjustable bearings, said bearings being arranged in said curved slots and the said form being adapted to be changed in shape by the turning of said screws, substantially as set forth.

3. The combination with a frame having arms integrally connected by a segmental part, said frame being slotted in said segment and arms, adjustable pins or studs arranged in said slots, screws arranged in said pins or studs and having heads arranged in pivoted spiral connections, open for the pivoted spiral connections, arranged on a flexible form and said flexible form, substantially as set forth.

4. The improved form for ship-builders, comprising a frame having radiating arms *a*, *b*, *c*, each of which is longitudinally slotted and carries of which are each at its end provided with a bearing for a damp-screw *p*, said arms being connected by slotted segments *e*, *f*, adjusting-screws *h*, arranged on adjustable studs or pins in the slots of the arms and segments, said studs having means for holding the same in said slots, connections for connecting the said adjusting-screws to the flexible form, and said flexible form, substantially as set forth.

5. The combination with the frame and flexible form of an arm *f*, carrying adjusting-screws loosely attached to said form and a brace connecting the frame and arm to hold the latter in place, substantially as set forth.

6. The combination with the frame and flexible form connected to said frame at one end of a slotted arm *f*, and adjusting-screws connected to said form and arranged in slots adjustably fastened in the slot of said arm, and a brace *g*, for holding said arm in fixed relation to said frame, substantially as set forth.

7. The combination with the frame and flexible form connected at one end to said frame, of an arm *f*, pivoted at one end upon said frame and held rigidly thereto by a brace said arm being provided with adjusting-screws, connected to said form, substantially as set forth.

699,058. ART OF MANUFACTURING BLOW GLASSWARE. JOHN I. ARDREMAN, CHARLES V. ARDREMAN, FRANK J. ARDREMAN, PHILIP E. ARDREMAN, and FREDERICK L. ARDREMAN, Pittsburgh, Pa. Filed Feb. 11, 1892. Serial No. 59,561. (No specimens.)

Claim.—1. The herein-described improvement in the art of forming and finishing hollow glassware, which consists in first forming, by pressure, a suitable blank; second, annealing the blank; third, reheating the annealed blank and finally finishing the article in a suitable mold.

2. The herein-described improvement in the art of forming and finishing glassware, which consists in first producing a blank, having a hollow finished neck and an unfinished bulb or body; then annealing said blank, reheating the annealed blank, and then blowing the body to shape in a suitable blow-mold.

3. The herein-described improvement in the art or process of manufacturing glassware, which consists in first producing a partly-finished blank, annealing said blank, reheating the annealed blank and blowing the body of the same to a finished shape in a suitable mold.

4. The improvement in the art or process of manufacturing glassware, which consists in simultaneously pressing in a mold a number of blanks, and thereby partly finishing the articles to be produced; annealing the blanks; reheating simultaneously a number of the annealed blanks by the local application of gas-jets to the unfinished parts, and finally blowing a number of blanks in a single mold by compressed air.

699,059. OIL-CAN. SAMUEL R. ANNEB, Birmingham, Ala. Filed Dec. 4, 1891. Serial No. 64,269. (No model.)

Claim.—1. The combination with a can or receptacle having a threaded nipple on the side thereof, and a pipe leading from the inner end thereof, and opening adjacent to the bottom of the can or receptacle, of a spout, a screw-cap to which the spout is screwed, said cap adapted to be removably screwed to the nipple, and a packing-gasket interposed between the nipple and cap.

2. The combination with a can or receptacle having a threaded nipple on the side thereof, and a pipe leading from the inner end thereof, and opening adjacent to the bottom of the can or receptacle, of a spout, a screw-cap to which the spout is screwed, said cap adapted to be removably screwed to the nipple, a packing-gasket interposed between the nipple and cap, and a cap loosely connected with the receptacle and adapted to fit over the open end of the spout, and prevent the spout from turning to its depressed position when the cap is in place on its open end.

699,060. RAIL-SOWER. FRANK R. BAW and GEORGE H. WELLS, Chicago, Ill. Filed Dec. 2, 1891. Serial No. 64,271. (No model.)

Claim.—1. A hopper having a centrally-recessed terminal provided with a web, adapted to be spread to expand the terminal into firm engagement with the surrounding metal, and a device within the recess adapted to be forced against the web, substantially as described.

2. A hopper having a terminal with opposite central recesses separated by a web, substantially as described.

3. A hopper having a terminal centrally recessed on both sides and provided with a web, adapted to be spread to expand the terminal into firm engagement with the surrounding metal, and a device within each recess adapted to be forced against the web, substantially as described.

4. A hopper having a terminal with a recess extending partially through and a web, in combination with a plugging device for entry within the recess to engage the web to expand the metal of the web laterally to bring the terminal into firm connection with the surrounding metal, the said plugging device being integral with the terminal, substantially as described.

5. A hopper having a terminal with recesses on opposite sides of the terminal, and a web interposed between the recesses, in combination with plugging devices for entry within the recesses to engage the web and thereby effect lateral distention thereof to bring the hopper-terminal into firm mechanical and electrical connection with the metal surrounding the terminal, substantially as described.

6. A hopper having a terminal with recesses on opposite sides of the terminal, and a web interposed between the recesses, in combination with plugging devices for entry within the recesses to engage the web and thereby effect lateral distention thereof to bring the hopper-terminal into firm mechanical and electrical connection with the metal surrounding the terminal, the said plugging device being integral with the terminal, substantially as described.

7. A hopper having a centrally-recessed terminal provided with a web, adapted to be spread to expand the terminal into firm engagement with the surrounding metal, and a device within the recess adapted to be forced against the web, the web being formed in one piece with the terminal, substantially as described.

8. A hopper having a terminal with opposite central recesses separated by a web formed in one piece with the terminal, substantially as described.

9. A hopper having a terminal with a recess extending partially through and a web, in combination with a plugging device for entry within

the recess to engage the web to expand the metal of the web laterally to bring the terminal into firm connection with the surrounding metal, said web being formed in one piece with the terminal, substantially as described.

10. A hopper having a terminal with a recess extending partially through and a web, in combination with a plugging device for entry within the recess to engage the web to expand the metal of the web laterally to bring the terminal into firm connection with the surrounding metal, the said plugging device being integral with the terminal, said web being formed in one piece with the terminal, substantially as described.

11. A hopper having a terminal with recesses on opposite sides of the terminal, and a web interposed between the recesses, in combination with plugging devices for entry within the recesses to engage the web and thereby effect lateral distention thereof to bring the hopper-terminal into firm mechanical and electrical connection with the metal surrounding the terminal, the said plugging device being integral with the terminal, said web being formed in one piece with the terminal, substantially as described.

699,061. CARTRIDGE. CHARLES A. BARTY, Greenwich, Conn. Filed Feb. 1, 1892. Serial No. 59,513. (No model.)

Claim.—1. In a cartridge, the combination, of a metal cap provided with the usual flange, a cross-piece having its ends projecting into the flange and provided centrally with a nipple having a hole at its outer end, a tube forming the body of the cartridge, and a web having an opening through which the nipple projects, the said web being compressed around the nipple and against the tube to form the inner end of the latter into that portion of the flange unoccupied by the ends of the cross-piece.

2. In a cartridge, the combination, of a metal cap having a solid end wall and peripheral flange, a cross-piece located in the cap with its ends projecting into the flange thereof, and a nipple formed on the central portion of the cross-piece and provided at its outer end with an inwardly-projecting conical portion and flash-hole.

3. In a cartridge, the combination, of the metal cap having a solid end wall and peripheral flange, a cross-piece located in the cap with its ends projecting into the flange thereof, a nipple formed on the central portion of the cross-piece and provided at its outer end with an inwardly-projecting conical portion and flash-hole, and a web having an opening through which the nipple projects, the said web being compressed around the nipple and into the flange, substantially as shown and described.

4. In a cartridge, the combination, of a cap having a peripheral flange, a cross-piece located within the cap with its ends projecting into the flange thereof, a nipple formed on the central portion of the cross-piece and flared at its outer end, and a web having a central opening through which the nipple projects, said web being compressed, substantially as shown and described.

5. In a cartridge, the combination, of a cap having a peripheral flange, a cross-piece located within the cap with its ends projecting into the flange thereof, a nipple formed on the central portion of the cross-piece flared at its outer end and provided with an inwardly-projecting conical portion forming a seat for the primer, a tube forming the body of the cartridge, and a web having a central opening through which the nipple projects, said web being compressed in the cartridge, substantially as shown and for the purpose set forth.

699,062. BARRED-WIRE FENCE. JOHN E. BAW, Boston, Ohio. Filed Dec. 31, 1891. Serial No. 57,595. (No model.)

Claim.—1. The combination with two fence-wires spirally twisted together, of a barb movably attached to said wires and comprising a single piece of wire bent to form two elongated loops which loosely enclose the respective wires whereby said barb is free to oscillate on said wires, the two ends of the barb being bent in opposite directions, substantially as described.

2. The combination with two fence-wires spirally twisted together, of a barb movably attached to said wires and comprising a single piece of wire bent to form two elongated loops which loosely enclose the respective wires whereby said barb is free to oscillate on said wires, said barb-wire being bent to form two parallel members that project between the

two fence-wires, the plane in which said parallel members lie being parallel with the longitudinal axis of the fence-wires, substantially as and for the purpose specified.

3. The combination with two fence-wires spirally twisted together, of a barb movably attached to said wires and comprising a single piece of wire extending between its ends across both the fence-wires and bent to form two elongated loops which loosely encircle the respective wires, the free end of the wire forming each loop passing between the two fence-wires and thence bent at a right angle away from its loop and past the adjacent loop, substantially as described.

4. The combination with two fence-wires spirally twisted together, of a barb movably attached to said wires and comprising a single piece of wire extending between its ends across both the fence-wires and bent to form two elongated loops which loosely encircle the respective wires, the free end of the wire forming each of said loops being passed between the two fence-wires in opposite directions, the free end of each loop being extended past and parallel with the adjacent loop, substantially as described.

699,063. HANGLER. WILLIAM H. BAKER, Boston, Mass. Filed Dec. 20, 1899. Serial No. 62,502. (No model.)

Claim.—1. In combination with a handle of the character described, the take-off attachment comprising the cross-bar, and the plurality of spring-metal plates fixed thereto, each plate being partially split up into several independently-yielding fingers, substantially as described.

2. In a handle, the combination of the rotating cylinder, the lever beneath the same, the endless screw, the rollers supporting the said screw, one of which is just above an end of the frame and another a short distance away from said roller and somewhat below its level, and a bridging plate constructed to contact with the cylinder and deliver the treaded surface therefrom to the screw of the screw between the two last-named rollers, substantially as described.

3. In a handle, the combination of the cylinder, the spur-gear rotating the same, the frame supporting said cylinder, the lever beneath said cylinder, the endless screw, the rollers supporting the screw, one of said rollers being located just above an end of one of said frame and another a short distance away and slightly below the level of said roller, the brackets fixed to said frame and rotatably supporting the roller at one end of one of the frame, the short shaft rotatably held by one of said brackets, the spur-gears fixed on the ends of said short shaft, one of which gears meshes with the spur-gear which rotates said cylinder, and a spur-gear rigidly connected with the last-mentioned roller and meshing with the other of the two gears on said short shaft, substantially as described.

699,064. RHODYAT, ELECTRIC HEATER, &c. EMERY F. BALL, Mount Vernon, N. Y., assignor, by mesne assignments, to H. Ward Leonard, Bronxville, N. Y. Filed June 27, 1899. Serial No. 64,610. (No model.)

Claim.—1. As a new manufacture, a unit resistance for a device wherein electric energy is intentionally converted into heat, comprising a supporting-body of mineral insulating material, a conductor embedded therein, and a metal protector for the insulating material adhesively engaging the same, substantially as and for the purpose set forth.

2. As a new manufacture, a unit resistance for a device wherein electric energy is intentionally converted into heat, comprising a supporting-body of vitreous insulating material, a conductor embedded therein, and a metal protector for the insulating material adhesively engaging the same, substantially as and for the purpose set forth.

3. As a new article of manufacture, a unit resistance for a device wherein electric energy is intentionally converted into heat, comprising a layer of mineral insulating material, a conductor embedded therein, a terminal having a larger current-carrying capacity than the conductor, connected to the conductor and having the joint located within the insulating material, a protective and heat-conducting metallic case, and a metallic support adapted to receive a series of said unit resistances with their metallic cases in close mechanical contact therewith.

4. As a new article of manufacture, a unit resistance for a device wherein electric energy is intentionally converted into heat, comprising a layer of vitreous insulating material, a conductor embedded therein, a terminal having a larger current-carrying capacity than the conductor, connected to the conductor and having the joint located within the insulating material, a protective and heat-conducting metallic case, and a metallic support adapted to receive a series of said unit resistances with their metallic cases in close mechanical contact therewith.

5. As a new article of manufacture, a unit resistance for a device wherein electric energy is intentionally converted into heat, comprising a layer of glass, a conductor embedded therein, a terminal having a larger current-carrying capacity than the conductor, connected to the conductor and having the joint located within the layer of glass, a protective and heat-conducting metallic case, and a metallic support adapted to receive a series of said unit resistances with their metallic cases in close mechanical contact therewith.

6. In an apparatus wherein electric energy is intentionally converted into heat, the combination of a heat-absorbing support having a series of tapered openings therein, and a unit resistance engaging each of said openings by friction and comprising an insulating-core, a conductor embedded in said core, and a metal jacket surrounding the core, substantially as set forth.

7. In an apparatus wherein electric energy is intentionally converted into heat, the combination of a heat-absorbing support having a series of tapered openings therein, and a unit resistance engaging each of said openings by friction and comprising an insulating-core, a conductor embedded in said core, and a self-metal jacket surrounding the core, substantially as set forth.

8. In an apparatus wherein electric energy is intentionally converted into heat, the combination of a heat-absorbing support having a series of tapered openings therein, and a unit resistance engaging each of said openings by friction, and comprising a core of mineral insulating material, a conductor embedded in said core, and a protective and heat-conducting metallic case.

9. In an apparatus wherein electric energy is intentionally converted into heat, the combination of a heat-absorbing support having a series of tapered openings therein, and a unit resistance engaging each of said openings by friction, and comprising a core of vitreous insulating material, a conductor embedded in said core, and a protective and heat-conducting metallic case.

10. In an apparatus wherein electric energy is intentionally converted into heat, the combination of a heat-absorbing support having a series of tapered openings therein, and a unit resistance engaging each of said openings by friction, and comprising a core of glass, a conductor embedded in said core, and a protective and heat-conducting metallic case.

11. In an apparatus wherein electric energy is intentionally converted into heat, the combination of a heat-absorbing support having a series of tapered openings therein, and a unit resistance engaging each of said openings by friction, and comprising a core of mineral insulating material, a conductor embedded in said core, a terminal having a larger current-carrying capacity than the conductor, connected to the conductor and having the joint located within the core, and a protective and heat-conducting insulating-case.

699,065. DUPLIX WAFER. GEORGE A. BAKER, Kingston, N. Y. Filed June 12, 1899. Serial No. 64,621. (No model.)

Claim.—1. As an article of manufacture, a composite wafer, built up of separate sheets of material secured together, said wafer having its upper and lower faces provided with coatings of an adhesive, the adhesive between the sheets and coatings of adhesive being stronger than that between the layers.

between the sheets and coatings of adhesive being stronger than that between the layers.

2. As an article of manufacture, a composite wafer built up of separate sheets of material detachably secured together as to be readily pulled apart, the top and bottom sheets of said wafer being coated externally with an adhesive of great strength for permanently securing substances thereto.

699,066. COOKING-CRANE. THOMAS J. RABBITZ, Boston, Mass. Filed June 17, 1899. Serial No. 64,614. (No model.)

Claim.—1. A cooking-crane comprising a staff and a small-support having swiveling connection with the staff, the support comprising a standard, arm connected therewith and having an enlarged open-work head for supporting a frying-pan and the like, and a rest pivotally connected with the arm and having a notch with which the handle of the usual cage.

2. A cooking-crane comprising a staff, an arm connected at one end to said staff and provided at its other end with a support for a pan, and vertically-adjustable means intermediate the support and the connection for engaging the handle of a vessel carried by the support.

3. A cooking-crane comprising a staff, and a small-support having swiveling connection with the staff, and having an enlarged head for supporting a frying-pan or the like, and a rest pivotally connected with the arm and having a notch with which the handle of the vessel engages.

699,067. TENSION MECHANISM FOR THE LOWER THREADS OF SEWING-MACHINES. GUNAR S. RASMUS, Copenhagen, Denmark. Filed Aug. 12, 1899. Serial No. 62,151. (No model.)

Claim.—1. An apparatus for tightening the lower thread of sewing-machines, comprising a rigid arm provided with a fastening, a hollow spindle detachably secured upon said arm by means of said fastening, a catcher revolvably mounted upon said spindle, a rod slidably mounted within said hollow spindle, a revolvable spool-house mounted within said catcher and centrally engaged by said rod, and means for intermittently pressing said rod against said spool-house.

2. An apparatus for tightening the lower thread of sewing-machines, comprising a rigid arm provided with a fastening, a catcher revolvably mounted upon said spindle, a rod slidably mounted within said hollow spindle, a revolvable spool-house mounted within said catcher and centrally engaged by said rod, a spring for pressing said rod into engagement with said spool-house, means controllable at will for adjusting the tension of said spring, and cam mechanism for intermittently actuating said spring.

699,068. VENTILATOR FOR COOKING VESSELS. ALFRED R. BURNETT, Vancouver, Canada. Filed Aug. 20, 1899. Serial No. 62,672. (No model.)

Claim.—1. In a device of the class described, the combination with the lid of a pot or pan of an opening in the top thereof having an upwardly-turned edge; a funnel to rest on the outside of said edge; a length of pipe detachably connected to the funnel; a spile and expanded end on the pipe; a second length within which the last slides; a branched connection attached to the stovepipe; a link connection between the pipe and its branch; a damper within the united part of the branched connection; a spring-clip above the branched connection, substantially as described.

2. In a device of the class described; in combination with a series of tubes, each communicating with an opening in the lid of cooking vessels on a stove, a branched member attached to the stovepipe to which the several pipes are connected; a flared connection between each pipe and its branch; a spring-clip above the branched member to engage each pipe when not in use; and a damper in the united part of the branch member, substantially as described.

3. As an attachment to a cooking-stove, a hollow member having a series of branching outlets attached over an opening in the stovepipe; a damper in the united part of each hollow member; a series of telescopic

pipe, one to each branch; a link connection between each branch and pipe; a split and expanded end on each lower pipe to slide within the upper; notched detents on the lower ends of each lower pipe; funnel-shaped pieces adapted to rest over openings in the post-ride, and pins on the upper ends of each funnel-shaped piece to engage and hold in the detents, substantially as described.

699,069. ATTACHMENT FOR WASHBOILERS. *Dr. ALBERT C. BAKER, Kankakee, Iowa, assignor of one-half to Joseph Starnes, Kankakee, Iowa.* Filed Aug. 28, 1901. Serial No. 73,088. (No model.)

Claim.—An attachment for receptacles consisting of a vertical strip or piece of metal designed to be mounted on the exterior of a receptacle and provided at intervals with rows of horizontal incisions, the metal above the incisions being bowed or bent outward and forming horizontal staves of upwardly-tapered protuberances, said protuberances having horizontal edges or shoulders, whereby the receptacle is prevented from slipping downward on a support and is permitted to be moved upward on the same, substantially as described.

699,070. HYDRALAMP. *WILLIAM E. BLOOMBERG, Southbridge, Mass.* Filed Apr. 20, 1901. Serial No. 57, 957. (No model.)

Claim.—1. In an eye-glass the combination with the nose-pad plate having a slot in the upper end, the bow and the post, of a second plate having one end rigidly secured to the bow and post and having a right-angled extension and having the intermediate guide fitting in the slot of said nose-pad plate and the other end extending from the said right-angled extension and carrying the nose-pad at the other end, as set forth.

2. In an eye-glass, a nose-pad-carrying plate comprising a body portion and the lateral portion having an extension parallel with the body portion and an arm at right angles thereto, and a leg depending from the plate on said lateral portion, as set forth.

3. In an eye-glass a nose-pad-carrying plate comprising a body portion with a leg having a head and a lateral portion having an extension parallel with the body portion and an arm at right angles thereto, and a nose-pad journaled on a shaft held in the end of said arm, as set forth.

699,071. GARMENT-PASTENING. *HOWARD BONE, Lancaster, Pa.* Filed Sept. 3, 1901. Serial No. 74,088. (No model.)

Claim.—A plate having a plurality of hooks projecting from one edge thereof, and provided with a spring between the hooks, with a spring-tongue in each space and extending through the edge from which said hooks project; and a second plate having a plurality of notched loops or folds constituting eyes, with provided intermediate flat portions and outer end projections in one plane, said intermediate flat portions having the edge ridges or ribs, of said plates adapted to be secured in place, as

shown; with said hooks engaging in said eyes, and said tongues, against said ridges or ribs; all substantially as described and for the purpose hereinbefore set forth.

699,072. ADJUSTABLE WRIST. *FREDERICK W. HANCOCK, New York, N. Y.* Filed Dec. 3, 1901. Serial No. 84,067. (No model.)

Claim.—1. An adjustable wrist, comprising a body having a rigid jaw, an adjustable jaw slightly fitted to the body, clamping-plates engaging with said body and with the adjustable jaw, and means for firmly clamping said plates upon the adjustable jaw.

2. An adjustable wrist, comprising a body having a tang and a rigid jaw, an adjustable jaw having a bifurcated shank which is slidably fitted to the tang, and clamping-plates engaging with said shank of the adjustable jaw and held on the body.

3. An adjustable wrist, comprising a body having a reduced portion and a rigid jaw, an adjustable jaw having a shank which is slidably fitted to the body, and clamping-plates fitted to the reduced portion of the body and engaging with the shank of said adjustable jaw.

4. An adjustable wrist, comprising a body having a reduced portion and a rigid jaw, an adjustable jaw, and clamping-plates fitted to the reduced portion and having interlocking connection with the body, and also engaging with the adjustable jaw.

5. An adjustable wrist, comprising a body having a rigid jaw, an adjustable jaw provided with a shank which has beveled edges, clamping-plates fitted to the body and engaging the beveled edges of said shank, and means for laterally clamping said plates to the body.

6. An adjustable wrist, comprising a body having a rigid jaw and an undercut guiding edge, an adjustable jaw provided with a shank having beveled edges one of which engages with the guiding edge, clamping-plates fitted to the body and engaging with the other beveled edge of the adjustable jaw-shank, and means for laterally clamping said plates upon said shank.

7. An adjustable wrist, comprising a body having a reduced portion, a tang, and a rigid jaw, an adjustable jaw provided with a shank which embraces the tang, clamping-plates fitted to the body and engaging with said shank of the adjustable jaw, and means for laterally clamping said plates upon the reduced portion of the body and the shank of said jaw.

699,073. HOOF-STRIPPER. *ARTHUR E. BUSHMAN, Cambridge, Mo.* Filed Dec. 20, 1901. Serial No. 84,961. (No model.)

Claim.—1. In a hoof-stripper, the combination with a pair of rollers mounted therein in stationary bearings, of a movable roller-frame, a roller mounted in said movable frame, a treadle, a link connected at one end to the movable roller-frame, and a spring connecting the other end of the link with the treadle and normally bearing on the treadle at its juncture with the link to constitute a stop for the latter.

2. In a hoof-stripper, the combination with a pair of rollers mounted therein, of a movable roller-frame carrying a roller, a treadle, a link connected at one end to the roller-frame, a spring coiled between its ends on a plate carried by the treadle, a leg connected with the link supporting one end of said spring, and the other end of said spring connected to the link.

3. In a hoof-stripper, the combination with an angular pair of strips secured thereto and projecting forwardly beyond the same, of a stationary roller in the forward end of the pair, a roller-frame pivoted on said strips and carrying a roller, a treadle pivoted to said strips, a leg on one of the strips, a plate on the treadle, a link connected at one end to the roller-

frame, and a spring coiled between its ends on said plate and having one end supported by the leg and the other end connected to the link.

699,074. COMBINED POLE-STRAP AND COLLAR-BUCKLE. *ALBERT C. BRYAN, Columbia City, Iowa.* Filed Dec. 14, 1900. Serial No. 58,811. (No model.)

Claim.—As an article of manufacture, a buckle comprising a middle bar and two end bars, all arranged parallel with each other, the middle bar being the longest and being outside of a plate passing through the other two bars, said middle bar being connected with the longer of said end bars by means of arc-shaped members, and connected with the shorter of said end bars by means of members bent three times approximately at right angles, thus forming shoulders for said shorter bar and also forming rounded wear-surfaces adjacent to said shoulders, yet leaving a comparatively wide space tapering by steps and parallel with said shorter bar for facilitating the admission of a strap, a relatively long shoulder-roller mounted upon the longer and bar to engage a wide strap, a relatively short shoulder-roller mounted upon the shorter and bar to engage a narrow strap, and a tongue mounted upon said middle bar and free to engage the longer of said shoulder-rollers.

699,075. DRYER. *SHARON CASE, Montgomery, Ind.* Filed Oct. 7, 1901. Serial No. 77,778. (No model.)

Claim.—1. A dryer, comprising a casing, a spring-actuated cover therefor, a bed-plate having downwardly-extended side portions provided with bearings for rollers, and a frame having downwardly-extended side portions for clamping a carbon-sheet, substantially as specified.

2. A dryer comprising a casing, a cover therefor, a bed-plate having downwardly-extended side portions which fit against the inner sides of the side walls of the casing, and a frame having side portions for clamping a carbon-sheet, substantially as specified.

699,076. MASK AND EYE. *EMIL R. CHAFFIN, Watertown, Conn.* Filed June 20, 1901. Serial No. 68,954. (No model.)

Claim.—1. A mask comprising a hooked portion, a shank portion, eyes on said shank portion, depending throat-pockets formed in both said shank and eye portions.

2. A mask of the class described, the same comprising a hook portion, a shank, eyes secured to said shank, and a depending throat-pocket formed in said eyes for attachment of the mask to a garment.

3. A mask of the class described, the same comprising an engaging hook formed of a double portion of the wire, a double horizontal right shank portion, eyes formed at the end of said shank, one or more depending throat-pockets formed in the shank and eye, and an upwardly-disposed hump formed in said shank beneath the hook and adjacent to said throat-pockets, substantially as shown and described.

699,077. ADJUSTABLE CULTIVATOR-ARM. *GEORGE CHAMBERLAIN, Chicago, Ill.* Filed Jan. 20, 1902. Serial No. 84,888. (No model.)

Claim.—1. A twin cultivator-frame, comprising vertical legs, formed at their bottom ends with outward horizontal portions for receiving the cheeks of the shovel-bars, a cross-bar loosely joined to the upper ends of said legs, and another cross-bar loosely connected to the said legs at points below their upper ends substantially as shown and described.

2. A twin cultivator-frame, comprising vertical legs formed at their bottom ends with outward horizontal portions, adjustable clamps secured upon said outward portions, shovel-bars carrying cheeks and held in said clamps, and two loosely-joined bars connected to the tops of the legs for a parallel motion of the legs substantially as described.

3. A twin cultivator-frame having vertical legs, a cross-bar loosely joined to their upper ends, and an upwardly-curved arch-bar having its lower extremities loosely joined to the said legs of the cultivator-frame, said cross-bar and arch-bar having pin-and-hole joints, and a locking-pin extending through the same to lock the parts rigidly together substantially as described.

699,078. FOLDING GRATE. *ROBERT E. CHRISTIE, New York, N. Y.* Filed Jan. 2, 1902. Serial No. 84,888. (No model.)

Claim.—1. A grate comprising a bottom, each hinged thereto and adapted to fold inward thereon, and three-membered sides, the lower member of each being rigidly associated with the bottom and diagonally braced against inward movement, the intermediate members being hinged to the bottom members and held against outward movement in a vertical line, and the upper members being adapted to fold over and interlock with the ends and to constitute the top section.

2. In a crane, ends cut away to provide tenons at their upper edges, in combination with top sections adapted to fold over on the ends and to engage the tenons, the under sides of the ends of the top section being cut away to provide rabbets to interlock with the top portion of the ends and bear against the inner surfaces thereof, substantially as and for the purpose specified.

3. In a crane, the combination with a bottom, of ends hinged thereto, three-membered sides carried by the bottom, and reinforcing cleats carried by the end portions of the sides, and having flanged projections to constitute steps to limit the outward movement of the sides, substantially as described.

699,079. WATER DISTRIBUTION. JOHN COLE, Cleveland Springs, Cal. Filed Oct. 16, 1901. Serial No. 73,726. (No model.)

Claim.—1. The combination with a power-shaft, of a counter-shaft operated thereby, a series of cams on each counter-shaft, a series of pumps having their piston-rods engaged by each cam, means for supplying water to the pumps under pressure, distributing-pipes leading from the several pumps, and check-valves in each pump, one on the inlet and the other on the outlet side of the pump-cylinder, substantially as set forth.

2. The combination with a power-shaft, of a counter-shaft operated thereby, a series of cams on each counter-shaft, a series of pumps having their piston-rods engaged by each cam, a frame for supplying water to the pumps under pressure, distributing-pipes leading from the several pumps, and check-valves in each pump, one on the inlet and the other on the outlet side of the pump-cylinder, substantially as set forth.

3. The combination with the shaft having a series of disks each disk having double cam-fingers, of a series of pumps, a grooved wheel on the piston-rod of each pump with which each cam-finger is designed to engage to force the piston in one direction, a frame for supplying water under pressure, connections between the frame and the pumps, distributing-pipes leading from the several pumps, and two check-valves in each pump, one between the frame connection and the pump-cylinder and the other between the latter and the distributing-pipe, substantially as set forth.

699,080. BARNETT-HANGER. HANFORD J. COOK, Syracuse, N. Y. Filed May 16, 1901. Serial No. 69,499. (No model.)

Claim.—1. The combination with the main supporting-arms connected flexibly together intermediate their ends, a clamping-plate fixed to the lower end of one of said arms, and a cooperating clamping-plate pivotally connected to the other of said arms, of a spring-wire coiled around the coupling-pin of the supporting-arms and fastened at its ends to the fixed clamping-plate, and formed with a transverse portion constituting the pivot-pin of the other clamping-plate as set forth and shown.

2. The combination of the forward-leaning main supporting-arms provided on its upper end with a hook, and a supplemental hanger formed in one piece of wire having one end portion bent into a lateral offset and mounted thereby on the offset hook and removable therefrom, the

upper extremity of said portion of the wire bent into the shape of a horizontal ring, the lower end portion of said wire bent into the shape of prolonged loops extending in opposite directions from the vertical portion of the wire substantially as described and shown.

699,081. PUMPING MECHANISM FOR FEEDING WATER TO STEAM-BOILERS. CHARLES CONNOR, Worcester, Mass. Filed July 11, 1900. Renewed Apr. 7, 1902. Serial No. 101,613. (No model.)

Claim.—1. In a water-feeding device for feeding water to a boiler, the combination of means for forcing water into the boiler against pressure, an induced water-receptacle from which water is fed to said forcing mechanism, a pipe leading from said water-receptacle to the boiler at its water-line, a pipe leading from said water-receptacle to a source of water-supply and means for alternately opening and closing said pipes, whereby said forcing mechanism is supplied from the water-supply or from said boiler as determined by the water-level in the boiler, substantially as described.

2. The combination with a boiler, of a pumping-cylinder, a reciprocating piston in said cylinder, a feed-water pipe leading from said cylinder to said boiler, a check-valve in said feed-water pipe, a valve-cylinder placed above said pumping-cylinder and communicating therewith, a pair of connected reciprocating pistons in said valve-cylinder with a space forming a water-receptacle between them, a pipe leading from said valve-cylinder to said boiler, a pipe leading from said valve-cylinder to a source of water-supply, said pipes being arranged to alternately communicate with the water-receptacle between said pistons, substantially as described.

3. The combination with a boiler, of an automatic feed-water mechanism, comprising a pump, a pipe provided with a check-valve leading from said pump to said boiler below its water-line, a water-receptacle independent of said pump, means for periodically connecting said water-receptacle and said pump, a pipe connecting said receptacle and the boiler at the water-line, a pipe connecting said receptacle with a source of water-supply and means for alternately opening and closing said pipes, substantially as described.

4. The combination of an induced water receptacle, or chamber, means for admitting water, or steam from the boiler to said chamber as determined by the water-level in the boiler, a source of water-supply communicating with said water receptacle, or chamber, means for alternately closing said water receptacle, or chamber, to the boiler and to the water-supply, a pump-cylinder and means for communicating said water receptacle, or chamber, with said pump-cylinder, substantially as described.

699,082. AUTOMATIC CAR-COUPLING. JOHN BARKER, Colverton, Ruttersham, England, assignor to Barker's Patent Automatic Coupling, Limited, Glasgow, Scotland. Filed Nov. 14, 1901. Serial No. 68,568. (No model.)

Claim.—1. In an apparatus for coupling and uncoupling railway carriages, wagons, and similar vehicles automatically, the combination with a draw-head, of a link and a link-engaging element pivoted on a vertical axis, to the draw-head, and a slide-bar connected to and horizontally swinging either the link or the link-engaging element in an operative position.

2. In an apparatus for automatically coupling and uncoupling rail-

way carriages, wagons, and similar vehicles, the combination with a draw-head, a link and a link-engaging element, of a vertical pin carrying the link and link-engaging element, secured to the draw-head, and a slide-bar connected to and moving the pin to swing either the link or link-engaging element horizontally to an operative or inoperative position.

3. In an apparatus for automatically coupling and uncoupling railway carriages, wagons, and similar vehicles, the combination with a draw-head, a link and a link-engaging element, of a vertical pin having secured thereto the link and the link-engaging element, and a slide-bar connected to and swinging horizontally and discontinuously the link and the link-engaging element, one to an operative position, and the other to an inoperative position.

4. In an apparatus for automatically coupling and uncoupling railway carriages, wagons, and similar vehicles, the combination of a draw-head, of a vertical pin secured in the draw-head, a link member comprising a link, a lever connecting the link and the pin, said link member being secured to the pin, a link-engaging element also secured to the pin, and a slide-bar connected to and moving the pin to swing either the link or link-engaging element horizontally to an operative or inoperative position, and means operated by the movement of the pin to elevate or lower the link of the link member.

5. In an apparatus for automatically coupling and uncoupling railway carriages, wagons, and similar vehicles, the combination with a draw-head, of a pin, a link member and a link-engaging element, secured to the pin, and adapted to swing horizontally, said link member comprising a link, a lever connecting the link and the pin, a toggle-link connected at one end to the link and pivoted to the pin, a weight at the other end of the toggle-link, and a projection heavily mounted on the pin and adapted to engage the weighted end of the toggle-link.

6. In an apparatus for automatically coupling and uncoupling railway carriages, wagons, and similar vehicles, the combination with the draw-head, the link, the jaws provided with pin-openings, and the pin H working in the openings of the pin O upon which the jaws and the link are mounted, means moving the pin O to draw either the link or the jaws to an operative position and means operated to move the pin H within the jaws on the movement of the pin O operating means.

7. The combination of the draw-head provided with pin-openings, the pin O mounted in the openings, the pin H carried by the pin O, the link member secured to the pin O, comprising the link F, a lever connecting the link and the pin, and a toggle-link secured at one end to the link F and connected to the pin; the weight secured to the free end of the toggle-link, the projection heavily mounted on the pin O and adapted to engage with the weighted end of the toggle-link, the jaws provided with openings and secured to the pin O, a pin H working in the openings in the jaws, the lever O carrying the pin H, the cross-bar G, the lever J provided with an eye in which the pin H works when the cross-

bar is moved to operate the pin O, and the extension on the lever J engaging with pin H opening lever O, substantially as described.

699,083. FURTURE-HEALING COMPOSITION. WILLIAM O. DE MAR, Cleveland, Ohio. Filed June 12, 1901. Serial No. 64,321. (No model.)

Claim.—A pasteurized-healing composition consisting of an admixture of water and fishy oils in the proportions substantially as set forth, the same constituting a seal of such nature that the light flakes of oils remain suspended for a prolonged period and do not pass when at rest, all substantially as heretofore described.

699,084. FLOATING SHINE-SHIRT OR WHEE FOR FISHING. JIM S. DILL, Provincetown, Mass., assignor of one-half to Robert A. Hammond, Sandwich, Mass. Filed Aug. 20, 1901. Serial No. 73,076. (No model.)

Claim.—1. A floating fish-net comprising a "pond" shaped at its bottom and sides and provided at its upper edge with floats or cork, a V-shaped "heart" entering the point of the pond and having a bottom connecting the lower edges of its side walls, a V-shaped buoyant frame to which the upper edges of the heart are connected, a buoyant, sectional, bladed framework of spars or the like exterior to said pond and flexibly connected to and opened beyond the upper edge thereof, the front ends of the two forward spars or frame-sections being flexibly secured or hinged to the sides of the said V-shaped frame, and the forward ends of the sides of the heart and its frame having inwardly-inclined sections to prevent the return of the fish, substantially as set forth.

2. A floating fish-net comprising a "pond" shaped at its bottom and sides and provided at its upper edge with floats or cork and weighted at its lower edge, a V-shaped "heart" shaped at its bottom, provided at its upper edges of its sides with a V-shaped buoyant frame and weighted at its lower edges, the rear smaller end of the heart entering the pond and the forward ends of the heart having inwardly-inclined walls to prevent return of the fish, a buoyant pond-frame surrounding a series of spars especially connected at their adjacent ends by hooks and eyes, the front end of the forward spars being similarly connected to the sides of the V-shaped frame, cords or ropes covering the upper edge of the pond to said spars as shown at A, guy-ropes connecting the forward end of the V-shaped frame with the sides of the pond-frame, and a floating "lead" connected at its rear end to the middle of the heart to draw the fish to either side thereof and provided with floats at its upper end and weighted at its lower end, substantially as set forth.

699,085. LIFT-WHEEL. GEORGE E. LIZANT, Louisville, La. Filed Oct. 11, 1901. Serial No. 73,597. (No model.)

Claim.—1. In a lift-wheel, a turning-arm, dogs carried in the in-

ward end of said arm, an angle-lever with which the rear end of the arm has swinging and oscillating connection, a piston for rocking said angle-lever, and a piston for moving the forward end of the arm upward, substantially as specified.

2. A leg-turner, comprising an arm having a head provided in its front surface with depressions or recesses, swinging dogs carried by the head and means for causing a vertical swinging motion of said arm, substantially as specified.

3. A leg-turner, comprising a turning-arm, dogs carried by said arm, a runner secured to said arm at its free end, a cross-head, a roller carried by the cross-head and on which said runner runs, a cylinder, and a piston in said cylinder having connection with the cross-head, substantially as specified.

4. A leg-turner, comprising a turning-arm, dogs carried by the forward end of said arm, an angle-lever pivoted in the frame of the machine, a block arranged to slide in said turning-arm, a connection between said block and the angle-lever, springs arranged in the arm at opposite sides of said block, and means for rocking the angle-lever, substantially as specified.

5. A leg-turner, comprising a frame, a turning-arm mounted to swing in the frame, dogs carried by said arm, a runner or track secured to the lower side of the free end of said arm and arranged at an angle in the length of the arm, a cross-head movable in guideways, a roller mounted in the cross-head and upon which said runner or track runs, rollers carried by the cross-head for engaging with the runner or track above the first-mentioned roller, a cylinder, and a piston in the cylinder having connection with the cross-head, substantially as specified.

6. In a leg-turner, a frame, a turning-arm mounted to swing in the frame, an angle-lever mounted to rock in the frame, a swinging and oscillating connection between the upper portion of said lever and the arm, a cross-head movable in guides and with which the lower member of said angle-lever engages, a cylinder, and a piston in the cylinder connecting with said cross-head, substantially as specified.

699,086. **HYDRAULIC VALVE.** JULIUS C. BROWN, Cleveland, Ohio. Filed July 12, 1901. Serial No. 63,794. (No model.)

Claim.—1. The body of the valve having a channel constructed to hold a sealing material adapted to hermetically seal the cover in said channel, in combination with the cover overlapping said channel and having a flange projecting down into the channel and provided with dogs adapted to lock on said exterior, and sealing material in said channel im-

mersing the said flange and the said exterior and dogs, substantially as described.

2. The body of the valve having a continuous channel in the upper edge of its bottom part constructed to hold a hardening sealing material, in combination with a top part provided with a continuous flange on its bottom in position to fit into said channel, and mechanism for holding the said top and bottom parts together, said mechanism connected with both parts and constructed to interlock when the cover is on and arranged to be confined wholly within said channel, whereby when the sealing material fills the said channel it immovably binds the said mechanism in locked position, substantially as described.

699,087. **PROCESS OF MANUFACTURING GOLF-BALLS.** BRADEN KENNEDY, Boston, Mass., assignor to The Kennel Manufacturing Company, a Corporation of New Jersey. Filed Mar. 12, 1908. Serial No. 67,581. (No model.)

Claim.—1. A process in producing a playing-ball, consisting in including a spherical core in previously-formed segments of plastic material so as to make a shell consisting of a plurality of layers, the segments being so placed that the joint in one layer crosses the joint in another layer, and subjecting the ball thus formed or assembled to compression.

2. A process in producing a playing-ball, consisting in including a spherical core in previously-formed segments of plastic material so as to make a shell consisting of a plurality of layers, the segments being so placed that the joint in one layer crosses the joint in another layer, bringing said layers to a plastic condition by means of heat, subjecting the whole to compression, and maintaining the compression while the shell cools and hardens.

3. A process in producing a playing-ball, consisting in including a spherical core in previously-formed segments of celluloid so as to make a shell consisting of a plurality of layers, the segments being so placed that the joint in one layer crosses the joint in another layer, and subjecting the ball thus formed or assembled to compression.

4. A process in producing a playing-ball, consisting in including a spherical core in previously-formed segments of celluloid so as to make a shell consisting of a plurality of layers, the segments being so placed that the joint in one layer crosses the joint in another layer, bringing said layers to a plastic condition by means of heat, subjecting the whole to compression, and maintaining the compression while the shell cools and hardens.

5. A process in producing a playing-ball, consisting in including a spherical core of springy material in shell layers of plastic material, at least one of said layers being previously formed and consisting of spherical segments, bringing said layers to a plastic condition, subjecting the whole to compression to such an extent as to compress said core, and maintaining the compression while the shell hardens.

6. A process in producing a playing-ball, consisting in including a spherical core consisting at least partially of gutta-percha in previously-formed segments of plastic material so as to make a shell consisting of a plurality of layers, the segments being so placed that the joint in one layer crosses the joint in another layer, subjecting the ball thus formed or assembled to compression to such an extent as to compress said core, and maintaining the compression until the shell hardens.

7. A process in producing a playing-ball, consisting in including a spherical core of gutta-percha in previously-formed segments of plastic material so as to make a shell consisting of a plurality of layers, at least one of said layers consisting of celluloid, and the segments being so placed that the joint in one layer crosses the joint in another layer, bringing said layers to a plastic condition by means of heat, subjecting the whole to compression, and maintaining the compression while the shell cools and hardens.

8. A process in producing a playing-ball, consisting in including a spherical core of gutta-percha in shell layers of celluloid, at least one of said layers being previously formed and consisting of spherical segments, bringing said layers to a plastic condition, subjecting the whole to compression, and maintaining the compression while the shell hardens.

9. A process in producing a playing-ball, consisting in including a spherical core of gutta-percha in previously-formed segments of celluloid so as to make a shell consisting of a plurality of layers, the segments being so placed that the joint in one layer crosses the joint in another layer, and subjecting the ball thus formed or assembled to compression.

10. A process in producing a playing-ball, consisting in including a spherical core of gutta-percha in previously-formed segments of celluloid so as to make a shell consisting of a plurality of layers, the segments being so placed that the joint in one layer crosses the joint in another layer, bringing said layers to a plastic condition by means of heat, subjecting the whole to compression, and maintaining the compression while the shell cools and hardens.

699,088. **PROCESS OF MANUFACTURING GOLF-BALLS.** BRADEN KENNEDY, Boston, Mass., assignor to The Kennel Manufacturing Company, a Corporation of New Jersey. Filed Mar. 12, 1908. Serial No. 67,582. (No model.)

Claim.—1. A process in producing a playing-ball, consisting in including a spherical core of springy material in previously-formed spherical segments of plastic material, heating said segments with a compressing-heat, placing over said coating an outer layer of spherical segments, bringing said layers to a plastic condition, and subjecting the whole to compression.

2. A process in producing a playing-ball, consisting in including a spherical core of springy material in previously-formed spherical segments of plastic material, heating said segments with a compressing-heat, said segments being so placed that the joint in one layer runs crosswise of the joint in the other layer, bringing said layers to a plastic condition, and subjecting the whole to compression.

3. A process in producing a playing-ball, consisting in including a spherical core of springy material in previously-formed spherical segments of celluloid, heating said segments with a layer of green celluloid, allowing said coating to harden so that it can be handled, placing over said coating an outer layer consisting of spherical segments of celluloid, heating said layers, and subjecting the whole to compression.

4. A process in producing a playing-ball, consisting in including a spherical core of springy material in previously-formed spherical segments of celluloid, heating said segments with a layer of green celluloid, allowing said coating to harden so that it can be handled, placing over said coating an outer layer consisting of spherical segments of celluloid, heating said layers, subjecting the whole to compression, and maintaining the compression while the shell cools and hardens.

5. A process in producing a playing-ball, consisting in including a spherical core of springy material in previously-formed spherical segments of celluloid, heating said segments with a layer of green celluloid, allowing said coating to harden so that it can be handled, placing over said coating an outer layer consisting of spherical segments of celluloid, the joint or seam in one layer running crosswise of the joint or seam in the other layer, heating said layers, and subjecting the whole to compression.

6. A process in producing a playing-ball, consisting in forming hemispherical segments of celluloid, placing said segments upon a sphere of gutta-percha, so as to form a plurality of layers, the joint or seam in one layer crossing a joint or seam in another layer, placing an incompletely-cured coating of celluloid between said layers, subjecting the whole to heat and compression to an extent to compress said core, and maintaining the compression while the shell cools and hardens.

699,089. **PLAYING-BALL.** BRADEN KENNEDY, Boston, Mass., assignor to The Kennel Manufacturing Company, a Corporation of New Jersey. Filed Mar. 12, 1908. Serial No. 67,583. (No model.)

Claim.—1. In a playing-ball, the combination of a shell consisting wholly of two layers, one of said layers consisting of fabric and the other thereof being relatively massive and consisting of celluloid in which said fabric is embedded, and a springy core filling said shell.

2. A playing-ball comprising a core of solid elastic material and a shell strongly gripping said core; said shell consisting wholly of two layers, one of which one is woven fabric and the other is relatively massive and consists of celluloid, the fabric being embedded in the inner side of the celluloid layer.

3. A playing-ball comprising a sphere of soft rubber and a shell thereon consisting of welded segments; each of said segments consisting wholly of two layers, whereof one is fabric and the other is celluloid, the fabric being embedded in the inner side of the celluloid layer.

4. A playing-ball comprising a sphere of yielding material and a shell holding said sphere under compression, said shell consisting wholly of two layers, whereof the inner consists of woven fabric and the outer consists of a relatively massive layer of celluloid in which said fabric is embedded.

699,090. **GOLF-BALL.** BRADEN KENNEDY, Boston, Mass., assignor to The Kennel Manufacturing Company, a Corporation of New Jersey. Filed Mar. 12, 1908. Serial No. 67,584. (No model.)

Claim.—1. A playing-ball comprising a soft-rubber core, a welded shell composed of hemispherical segments including said core, and a ligament reinforcing said weld.

2. A playing-ball comprising a shell of hemispherical segments of celluloid welded and compressed upon a filling of elastic material, and a ligament internally reinforcing said weld.

3. A playing-ball comprising a yielding spherical core, a shell composed of hemispherical segments of plastic material welded together and compressed upon said core, and a ligament internally reinforcing the weld.

4. A playing-ball comprising a spherical body, a shell built up from hemispherical segments of plastic material welded together and holding said body under compression, and a ligament reinforcing the weld of the segments and embedded in the material of the shell.

5. A playing-ball comprising a spherical highly-vulcanized rubber core, a shell composed of hemispherical segments of plastic material compressed upon said core, and a fabric ligament embedded in the shell and reinforcing the weld.

6. A playing-ball comprising a welded shell of hemispherical segments of celluloid compressed upon a filling of elastic material, said filling being held under compression by said shell, and a fabric band internally reinforcing the shell at the weld, and embedded in the celluloid.

699,091. **PLAYING-BALL.** BRADEN KENNEDY, Boston, Mass., assignor to The Kennel Manufacturing Company, a Corporation of New Jersey. Filed Mar. 12, 1908. Serial No. 67,585. (No model.)

Claim.—1. A playing-ball comprising a center piece, rubber wound continuously in different directions thereon to form a materially larger sphere, and a thick solid soft-rubber covering tensioned upon said sphere.

2. A playing-ball comprising rubber wound continuously in different directions under tension to form a sphere, and a solid soft-rubber covering

upon said sphere, said envelope consisting of undivided spherical segments drawn over said sphere and caught at their edges.

3. A playing-ball comprising a center piece and a plurality of soft-rubber spheres thereon, one of said spheres including the other, and one of said spheres consisting of solid soft rubber under tension, and the other consisting of rubber wound in different directions under high tension and continuously.

4. A playing-ball comprising a sphere of tensioned rubber threads and undivided segments of soft rubber drawn together upon said sphere and cemented together at their edges.

5. A playing-ball comprising a core, rubber threads wound thereon under tension, and undivided segments of soft rubber drawn together upon said sphere and cemented thereon, and also cemented together at their edges.

6. A playing-ball comprising rubber wound continuously in different directions under tension and forming a sphere, a thick solid soft-rubber envelope upon said sphere, and a shell of harder material upon said envelope.

7. A playing-ball comprising a center piece, rubber wound continuously in different directions thereon and forming a materially larger sphere, a thick solid soft-rubber envelope tensioned upon said sphere, and a shell of hard, plastic material upon said envelope.

8. A playing-ball comprising rubber wound continuously in different directions and under tension and forming a sphere, a solid soft-rubber envelope upon said sphere, said envelope consisting of undivided spherical segments drawn over said sphere and caught at their edges, and a shell of gutta-percha upon said envelope.

9. A playing-ball comprising a center piece and a plurality of soft-rubber spheres thereon, one of said spheres including the other, and one of said spheres consisting of solid soft rubber under tension, and the other consisting of rubber wound in different directions continuously and under high tension, and a shell of hard material holding said rubber spheres under compression.

10. A playing-ball comprising a sphere of tensioned rubber threads, undivided segments of soft rubber drawn together upon said sphere and cemented together at their edges, and a shell of plastic material holding said segments under compression.

11. A playing-ball comprising a core, rubber threads wound thereon and under tension, undivided segments of soft rubber drawn together upon said sphere and cemented thereon, and also cemented together at their edges, and a shell consisting of welded segments of gutta-percha and holding said soft-rubber segments under compression.

12. A playing-ball consisting of rubber wound continuously in different directions under tension and forming a sphere, a thick solid soft-rubber envelope upon said sphere, and a fabric-lined shell of plastic material upon said envelope.

13. A playing-ball comprising a springy center piece, rubber wound continuously in different directions thereon and under tension, a thick solid soft-rubber envelope tensioned upon said rubber windings, and a shell of fabric-lined plastic material holding said envelope under compression.

14. A playing-ball comprising a plurality of soft-rubber spheres, one sphere including the other, and one of said spheres consisting of solid soft rubber under tension, and the other consisting of rubber wound continuously in different directions and under high tension, and a shell consisting of plastic material and fabric and holding said rubber spheres under compression.

15. A playing-ball comprising a center piece, rubber threads wound continuously in different directions thereon and under tension, undivided segments of soft rubber drawn together upon said sphere and cemented thereon, and also cemented together at their edges, and a fabric-lined gutta-percha shell holding said soft-rubber segments under compression.

699,092. PLAYING-BALL. BRADEN KNEPFAHL, Boston, Mass., assignor to the Kneppell Manufacturing Company, a Corporation of New Jersey. Filed Mar. 21, 1908. Serial No. 100,000. (No model.)

Claim.—1. A playing-ball comprising a center piece, a thick, solid soft-rubber envelope upon said center piece, rubber wound continuously in different directions and under tension upon said envelope, and a shell of hard material upon said wound rubber.

2. A playing-ball comprising a center piece, a thick, solid soft-rub-

ber envelope tensioned upon said center piece, rubber wound continuously in different directions upon said envelope and forming a materially larger sphere, and a shell of hard, plastic material upon said wound rubber.

3. A playing-ball comprising a springy center piece, undivided spherical segments of soft rubber drawn over said center piece and caught at their edges, rubber wound continuously in different directions and under tension upon said segments and forming a materially larger sphere, and a shell of gutta-percha upon said wound rubber.

4. A playing-ball comprising a center piece, undivided segments of soft rubber drawn together upon said center piece and cemented together at their edges, tensioned rubber wound continuously in different directions over said segments and forming a materially larger sphere, and a shell of plastic material holding said wound rubber under compression.

5. A playing-ball comprising a center piece, undivided hemispherical segments of soft rubber drawn together upon said center piece and cemented thereon and also cemented together at their edges, rubber wound thereon continuously in different directions and under tension, and a shell consisting of welded segments of gutta-percha and holding said rubber under compression.

6. A playing-ball comprising a center piece, a solid soft-rubber envelope thereon, rubber wound continuously in different directions and under tension upon said envelope, and a fabric-lined plastic shell upon said wound rubber and holding the latter under compression.

7. A playing-ball comprising a center piece, a solid soft-rubber envelope thereon, rubber wound continuously in different directions and under tension upon said envelope, and a fabric-lined plastic shell upon said wound rubber and holding the latter under compression.

8. A playing-ball comprising a center piece of gutta-percha, undivided hemispherical segments of soft rubber drawn together upon said center piece and cemented thereon and also cemented together at their edges, rubber threads wound continuously in different directions upon said soft-rubber hemispheres and forming a materially larger sphere, and a fabric-lined gutta-percha shell holding said rubber threads under compression.

699,093. GOLF-BALL. BRADEN KNEPFAHL, Boston, Mass., assignor to the Kneppell Manufacturing Company, a Corporation of New Jersey. Filed Apr. 2, 1908. Serial No. 101,000. (No model.)

Claim.—1. A playing-ball comprising a substantial gutta-percha shell lined with fabric and a one-part solid core made of plastic material and powerfully gripped by said shell.

2. A playing-ball comprising a substantial gutta-percha shell lined with fabric and a core of gutta-percha filling said shell.

3. A playing-ball comprising a substantial gutta-percha shell lined with fabric and a one-part solid core of gutta-percha held under permanent compression by said shell.

4. A playing-ball consisting wholly of spheres of gutta-percha and fabric.

5. A playing-ball comprising a fabric-lined gutta-percha shell consisting of welded segments, and a solid sphere consisting entirely of gutta-percha filling said shell and held under compression thereby.

6. A playing-ball consisting of a highly-compacted shell built up from gutta-percha segments and lined with fabric, said segments being welded edge to edge, and a filling consisting of gutta-percha powerfully gripped by said shell.

7. A playing-ball comprising a shell built up of highly condensed or compacted thick fabric-lined hemispherical sections of well-cured gutta-percha, and a one-part core of highly-compacted gutta-percha held under compression by said shell.

8. A playing-ball comprising a highly-compacted substantial fabric-lined gutta-percha shell and a core of highly-compacted gutta-percha powerfully gripped by said shell, the diameter of said sphere being about one-half that of the complete ball.

699,094. PLAYING-BALL. BRADEN KNEPFAHL, Boston, Mass., assignor to the Kneppell Manufacturing Company, a Corporation of New Jersey. Filed Apr. 8, 1908. Serial No. 101,000. (No model.)

Claim.—1. A playing-ball comprising a body or center, and an applied shell or casing constructed of overwound strips of interlaced steel.

2. A playing-ball comprising a body or center, and an applied shell or

casing constructed of overwound interlaced strips of colloid compressed upon said body or center.

3. A playing-ball comprising a body or center of gutta-percha, and an applied shell or casing constructed of overwound strips of interlaced steel.

4. A playing-ball comprising a body or center of gutta-percha, and an applied shell or casing constructed of overwound interlaced strips of colloid compressed upon said body or center.

5. A playing-ball comprising a springy body or center, and an applied shell or casing constructed of overwound strips consisting of colloid and fabric and welded together and holding said center under compression.

6. A playing-ball comprising a springy spherical body or center, and an applied shell or casing constructed of overwound interlaced strips of colloid compressed upon said body or center.

7. A playing-ball comprising a body or center, and an applied shell or casing constructed of overwound strips of colloid lined with woven fabric.

8. A playing-ball comprising a springy body or center, and an applied shell or casing constructed of overwound strips of colloid lined with woven fabric, said strips being welded together, and the whole being compressed upon said center.

9. A playing-ball comprising a hard spherical body or center of gutta-percha, and an applied shell or casing constructed of overwound thin strips of colloid lined with textile fabric.

10. A playing-ball comprising a body or center, and a shell thereon consisting of strips, said strips consisting of colloid and fibrous material, and being wound continuously in different directions and welded together where they cross.

11. A playing-ball comprising a shell which consists of strips of colloid wound continuously in different directions and welded together where crossing; fibrous material being embedded throughout said shell.

12. A playing-ball comprising a core and a shell thereon; said shell consisting of strips of plastic material and fabric; all of said strips being wound continuously in different directions, the plastic material being welded strip to strip, and the fabric strips being embedded in said plastic material.

13. A playing-ball comprising a core and a shell holding said core under compression; said shell consisting of strips of colloid and strips of fabric; all of said strips being wound continuously in different directions, said colloid being welded strip to strip, and the fabric strips being embedded in said colloid.

14. A playing-ball comprising a shell made of plastic material and fibrous material; said plastic material forming a continuous or subcontinuous shell, and said fibrous material extending prominently throughout said shell; and a core within said shell.

15. A playing-ball comprising a core of springy material and a shell holding said core under compression; said shell consisting of colloid, and segments of fibrous material being interspersed throughout the shell and holding tightly upon said core.

16. A playing-ball comprising a springy body or center, and a highly-compacted shell thereon, said shell consisting of strips wound continuously in different directions upon said body and welded where crossing; and said strips being compounded of plastic material and fibrous material.

17. A playing-ball including a sphere consisting of a strip or strips of colloid wound continuously in different directions.

699,095. HERNAL TRUSS. JULIUS G. LE HANE, Greenwich, Ga. Filed Feb. 7, 1908. Serial No. 60,001. (No model.)

Claim.—1. A hernial truss comprising two wires bent to conform to the contour of different parts of the body and to stand free from the surface thereof, binding-posts having duplicate wire-apertures to receive and hold the respective ends of the two wires, hip-pads secured to the said binding-posts, binding-posts adjustably mounted on each wire at the front and intermediate the hip-pads, a hernial pad adjustably secured to the inner end of each intermediate binding-post, and a fastening-strap to enclose the binding-posts of the hip-pads.

2. A hernial truss comprising a wire bent to the contour of the abdomen and hips and to stand free and away from the body with its ends terminating at points above and back of the great trochanter in the hollow of the femur, a plurality of binding-posts each having an aperture to adjustably engage over the wire at each end and a threaded end at the inner end, a clamping-strap let through the head of each binding-post, a hip-pad detachably secured to the threaded end of each binding-post, a binding-post adjustably mounted on the wire intermediate the hip-pads, a screw to clamp the binding-post to the wire, a plate adjustably secured to the inner end of the binding-post, a hernial pad secured to the plate, and a fastening-strap connecting the binding-posts of the hip-pads.

699,096. SUIT-HOLDER. CHARLES S. BARROW, Rochester, N. Y., assignor, by mesne assignments, to Albaugh Bros., Dover and Company, Chicago, Ill. Filed Jan. 14, 1908. Serial No. 63,007. (No model.)

Claim.—1. In a suit-holder, the combination with the back portion provided with the arm-arms at each end, of the movable front pivoted to the back by a swinging hinge at one end, a pin in the other end of said front portion, and a strap secured to the back portion, a metallic flange on the end of said strap having holes to receive said pin, substantially as described.

2. In a suit-holder, the combination with a stationary back portion, a bent wire of one piece secured to said back portion, having loops at each end forming arm-arms, and a loop in its center for supporting the device, a front portion, a pair of single flaps connecting said front and back portions, a flexible strap secured to said back portion, a pin on the front portion, a metallic flange on said strap having holes to engage said pin, and a hook on said flange, substantially as described.

699,097. MILK-COOLER. WILLIAM C. BLAKE, Mansfield, Ohio, assignor to Elizabeth J. Blake. Filed Nov. 20, 1907. Serial No. 57,000. (No model.)

Claim.—1. In a milk-cooling apparatus the combination with an inner and outer receptacle, the inner receptacle to hold milk, the outer receptacle for water, the inner receptacle provided with a perforated dip below the bottom, a cone-shaped central vertical tube secured in the center of the bottom of the inner receptacle, a depression formed in the bottom of the inner receptacle, a threaded sleeve secured in the wall of the

same and in line with the depression, a threaded collar secured on the outside of the water-receptacle, and in line with the threaded sleeve, a stop-cock secured within the collar and adapted to engage with the threads in the sleeve the said cock adapted to draw the milk and cream from the inner receptacle and the water from the outer receptacle, a lid or cover cone-shaped in the center, and provided with a flange covering the water-space between the inner and outer receptacles, the said flange provided with two downwardly-projecting ribs the outer rim adapted to fit over the outer receptacle, the inner rim passing inside of the milk-receptacle, the center of the cover provided with a curb or ring and ring provided with a suitable screw a cover or cap provided with a vent-tube, a transparent gage secured within the wall of the outer receptacle, and one in the wall of the inner receptacle the two placed in line with each other the lid provided with an inlet-pipe the outer receptacle provided with a discharge-pipe near the upper edge the inner and outer receptacles independent of each other, the inner receptacle removable from the outer receptacle, substantially as shown and described.

2. The herein-described milk-cooler comprising an outer receptacle, an inner receptacle of less diameter having a bottom and a perforated rim below said bottom, said bottom having at its edge a depression I, a collar in the rim of the inner receptacle adjacent to and communicating with said depression, a spigot passing through said collar and through the outer receptacle, a central cone-shaped tube rising from the bottom of the inner receptacle, and a cover having flanges and closing the top of the inner and outer vessels and the space between them, all substantially as shown and described and for the purpose specified.

3. The milk-cooler herein shown and described, consisting of the outer receptacle having open top and closed bottom, a discharge-spout near the top, a receptacle within said outer receptacle having a series of openings near its lower edge, a bottom above said openings having a depression at one side, a spigot leading from said depression, of the inner receptacle through the outer receptacle, a central tube rising from the raised bottom of the inner receptacle, a cover having flanges to fit snugly on the inner and outer receptacles, an inlet in said cover having a hinged cap, and a vent-tube in said cover.

699,098. LINK-BELT TIRE. THOMAS M. BYRNE, Atlanta, Ga. Filed July 1, 1901. Serial No. 61,897. (No model.)

Claim.—1. In a link-belt tire, an outer U-shaped element and an inner element adapted to rest within same and form a dentation, means for securing said elements together and securing the members so formed to each other, said outer elements being joined in their contiguous faces and elastic blocks seated therein.

2. In a link-belt tire, an outer U-shaped element and an inner element adapted to rest therein, means for securing said elements together and the members so formed to each other, said outer elements being chambered in their contiguous faces and elastic blocks seated therein, said elastic blocks extending over and sealing the joints between the lower contacting faces of said elements.

3. In a link-belt tire, an outer U-shaped element and an inner element adapted to rest therein, means for connecting said elements and for connecting the members so formed to each other comprising lugs on one of said elements and perforated metallic links engaging said lugs and extending from one member to the next.

4. In a link-belt tire, an outer U-shaped element and an inner element adapted to rest therein and having a tooth formed on its bottom projecting inwardly, lugs on said inner element axially in the plane of the pitch-line of said tooth, and links engaging the lugs of contiguous pairs of said members and means for securing said elements together to form said members.

699,099. COMBINED TRACE-HOLDER AND DETACHING REIN. WILLIAM D. BORN, Newbury, Tenn., assignor of one-half to W. T. BORN, Newbury, Tenn. Filed Jan. 9, 1908. Serial No. 62,000. (No model.)

Claim.—In combination with a whiffletree, a trace-holder and detaching device, consisting of the plate 1, adapted to be secured to the rear edge of the whiffletree; the projecting portion 1' of said plate extending beyond the end of the whiffletree and terminating in a forked end; the integral, forwardly-extending member 2', engaging the end of the whiffletree and terminating in pivoted cam; the trace-holder 4, hinged to said cam and having its outer end provided with a beveled face; the locking member 5 suitably secured to the rear side of the plate 1, and having its outer end extending beyond the projecting member 1' of the plate 1, and bent to form an eye to engage the pull-strap 7, one part of the bent portion extending at a right angle over the forked end of the member 1', and another part formed into a beveled face, adapted to cooperate with the beveled face of the trace-holder 4; the ball 6 seated in the rear edge of the whiffletree, straddling the members 1 and 5, all arranged as shown and for the purpose specified.

699,100. CASE-REGISTER. THOMAS GARNETT, Dayton, Ohio, assignor, by mesne assignments, to National Cash Register Company, Jersey City, N. J., a Corporation of New Jersey. Filed Apr. 4, 1906. Serial No. 711,948. (No model.)

Claim.—1. In a cash-register, the combination with register-operating device, of duplicate counters arranged to be brought into connection with the same, independent throwing devices for the respective counters, a slidable rod for adjusting said throwing devices, an operating-key and a lever arranged to be operated by said key and connected to the slidable rod.

2. In a cash-register, the combination with register-operating device, duplicate counters arranged to be moved into connection with the same, a shifting bar, a lever for operating said bar, a key and a latching means for said lever arranged to be released by said key.

3. In a cash-register, the combination with register-operating device, duplicate counters arranged to be moved into connection with the same, a shifting rod for said counters, a lever for operating said rod, a key for moving said lever and means connected to the movable parts of the machine and arranged to be projected into the path of said lever and thus lock it against operation after the operation of the machine has commenced.

4. In a cash-register, the combination with register-operating device, of duplicate counters arranged to be brought into connection with the same, throwing-levers for said counters, a slidable rod for adjusting

said throwing-levers to operative or inoperative positions, a key for operating said rod, and means connected to said key and engaging said rod.

5. In a cash-register, the combination with register-operating device, of independent counters arranged to be brought into connection with the same, a shifting device for said counters, a special key for operating said device and means connected to the movable parts of the machine for limiting the initial movement of said key but adapted to be moved out of the path of the key to permit the latter to continue its movement.

6. In a cash-register, the combination with register-operating device, independent counters arranged to be brought into connection with said operating device, a shifting device for said counters, a key for operating said device arranged to have a partial initial stroke and to become coupled to the operating device as to be moved thereby through the remainder of its stroke.

7. In a cash-register, the combination with a series of keys, of a register-operating mechanism connected to the same, independent counters arranged to be moved into connection with said operating mechanism, a key-coupler, a shifting device for said counters, and a key for actuating said device arranged to first make a partial stroke by itself and then be coupled and operated with the regular keys.

8. In a cash-register, the combination with register-operating device, of independent counters, a shifting device for the same, a pivoted lever arranged to operate said shifting device and having an inclined slot and a key having a pin projecting into said slot.

9. In a cash-register, the combination with register-operating device, of a plurality of counters arranged to be brought into connection therewith, a shifting device for said counters, a key for operating said shifting device and a stop arranged to limit the initial stroke of said key and connected to the movable parts of the machine as to be moved upon the operation of the latter to permit a full stroke of said key.

10. In a cash-register, the combination with a series of keys, of register-operating device connected to the same, a movable shifter arranged to be operated by any of said keys, duplicate counters arranged to be moved into connection with said register-operating device and a special key for controlling said counters arranged to first make a partial stroke by itself and then be coupled and operated with the regular keys.

11. In a cash-register, the combination with a series of keys, of register-operating device, a key-coupler, a plurality of independent counters arranged to be brought into connection with the register-operating device, a shifting key for said counters, a lever arranged to be operated by said key, a locking-bar mounted on the key-coupler and arranged to either resist the said lever or limit the initial movement of the shifting key accordingly as pressure is applied to said key before or after the movement of the key-coupler.

12. In a cash-register, the combination with register-operating device, of independent counters arranged to be brought into connection

with the same, a shifting device for said counters, a special key for operating the shifting device, a stop for arresting the key after it has made a partial stroke, a link and connection for holding the shifting device in its operated position, and means for allowing the key to be fully operated to trip said link.

13. In a cash-register, the combination with register-operating device, of independent counters arranged to be brought into connection with the same, a shifting device for the same, a pivoted lever for operating the same, a key for operating the lever, means for holding the lever, and a trip for said link mounted on the key.

14. In a cash-register, the combination with register-operating device, of a plurality of independent counters arranged to be thrown into connection with the same, adjusting devices for said counters, a rod for operating said devices carrying a bevel-faced projection, a printing device and operating means connected to said printing device and engaging said bevel-faced projection.

15. In a cash-register, the combination with a registering and printing mechanism, of a plurality of counters, a key for bringing either of said counters into connection with the registering mechanism at will, a slotted lever arranged to be operated by said key, and a special printing device having a projection which enters the slotted lever whereby said device is operated.

699,101. ROTARY CHURN. WILLIAM B. GARDNER, Centerville, Ill. Filed Feb. 2, 1901. Serial No. 61,899. (No model.)

Claim.—In a churn, the combination of a suitable framework, a shaft supported thereby, parallel arms secured to said shaft, a receptacle or churn removably secured to said parallel arms, weights carried by the opposite extended portions of said parallel arms, means to adjust said weights to respectively counterbalance the churn or receptacle and contents and operating mechanism substantially as described.

699,102. STEAM-GENERATING SYSTEM. WILLIAM GUNTER, BAR, Wabash, Pa., assignor of two-thirds to Alexander Hunter and Raymond Hunter, Wabash, Pa. Filed July 4, 1901. Serial No. 67,191. (No model.)

Claim.—1. In a steam-generating system, the combination with a primary generator, a furnace or other source of heat therefor, and a steam-conduit within the said primary generator, of a series of secondary generators each having a steam-conduit therein and in communication with the steam-conduit in the primary generator whereby steam is generated in the secondary generators by the steam supplied from the primary generator, a steam-delivery conduit common to all of the generators, and a water-fuel conduit common to all the generators having a series of depending branches extending into the respective generators and discharging in close proximity to the bottom wall of said generators, substantially as described.

2. In a steam-generating system, the combination with a primary

generator, and means for supplying heat to said primary generator, of a plurality of secondary generators each having a steam-circuit located therein and connected to the primary generator whereby steam is generated to the secondary generators solely by the aid of the steam supplied from the primary generator, a water-feed conduit for supplying water to each of the generators simultaneously, and a steam-delivery conduit common to all the generators, substantially as described.

2. In a steam-generating system, a primary generator supplied with heat from a suitable source, and a plurality of secondary generators each having a water-circuit therein connected to the primary generator, a water-feed conduit connected to each generator so as to supply water to all simultaneously, and a steam-delivery conduit common to all the generators, substantially as described.

699,103. ROASTER. WILLIAM F. O'NEIL, Dublin, Co. Filed Apr. 10, 1901. Serial No. 66,572. (No model.)

Claim.—1. A roaster, comprising a base adapted to have a portion of it engaged in an opening in a stove-top, a tray-like portion on the base and of larger diameter than the base, standards extended upward from the tray-like portion, a shaft supported in said standards, a rotating-cylinder mounted on the shaft, and agitators in the cylinder, said agitators being arranged in spirally-disposed rows, substantially as specified.

2. A roaster, comprising a cylindrical base having an inwardly-extended flange designed to rest upon the top of a stove or range, and a downwardly-extended flange at the inner edge of the first-named flange, a tray supported on the base and of larger diameter than the base, standards extended upward from the tray, a shaft supported in the standards, and a rotating-cylinder mounted on the shaft, substantially as specified.

699,104. PATTERN MECHANISM FOR LOOM. ARTHUR I. O'NEIL, Worcester, Mass., assignor to O'Neil & Knowles Loom Works, Worcester, Mass., a Corporation of Massachusetts. Filed Oct. 21, 1901. Serial No. 66,602. (No model.)

Claim.—1. In pattern mechanism for looms, the combination with the drop-bar-pattern chain-cylinder, and a multiplier-pattern chain-cylinder, and intermediate connecting mechanism, and mechanism for operating

ing said drop-bar-pattern chain-cylinder, and multiplier-pattern chain-cylinder, of a second multiplier-pattern chain-cylinder, and intermediate mechanism connecting said second multiplier-pattern chain-cylinder with the drop-bar-pattern chain-cylinder and the first-mentioned multiplier-pattern chain-cylinder, and mechanism for operating said second multiplier-pattern chain-cylinder, substantially as shown and described.

2. In pattern mechanism for looms, the combination with the drop-bar-pattern chain-cylinder, a pin-wheel and star-wheel mechanism for operating the same, a multiplier-pattern chain-cylinder, and a pin-wheel and star-wheel mechanism for operating the same, and a second multiplier-pattern chain-cylinder, and a pin-wheel and star-wheel mechanism for operating the same, of an indicator-lever for the drop-bar-pattern chain-cylinder, and an indicator-lever for each multiplier-pattern chain-cylinder, and connections intermediate the indicator-lever of the drop-bar-pattern chain-cylinder, and each indicator-lever of the multiplier-pattern chain-cylinders, and pattern-surfaces on the drop-bar-pattern chain-cylinder, by means of which either multiplier-pattern chain-cylinder is put into operation, or out of operation, from the drop-bar-pattern chain-cylinder, by means of which the drop-bar-pattern chain-cylinder is put out of operation, when either multiplier-pattern chain-cylinder is put into operation, and is put into operation when either multiplier-pattern chain-cylinder is put out of operation, substantially as shown and described.

3. In the pattern mechanism of looms, a drop-bar-pattern chain mechanism, a multiplier-pattern chain mechanism, and a second multiplier-pattern chain mechanism, each multiplier-pattern chain mechanism having an indicator-lever connected to a centrally-pivoted lever, the lever of which at either end, will, through intermediate connections, put the drop-bar-pattern chain mechanism out of operation, and the raising of which will put it into operation, substantially as shown and described.

4. In the pattern mechanism of looms, a drop-bar-pattern chain mechanism, a multiplier-pattern chain mechanism, and a second multiplier-pattern chain mechanism, each multiplier-pattern chain mechanism having an indicator-lever connected to a centrally-pivoted lever, the movement of which in one direction will, through intermediate connections, put the drop-bar-pattern chain mechanism out of operation, and the movement in the other direction will put the drop-bar-pattern chain mechanism into operation, substantially as shown and described.

699,105. CARPET-STRETCHER. ALBERT H. DAVIS, Crawfordsville, Ind., assignor of one-half to James R. Barnett, Crawfordsville, Ind. Filed June 1, 1901. Serial No. 66,708. (No model.)

Claim.—1. A carpet-stretcher comprising a block having bars or prongs for engaging the carpet, a rack-frame arranged upon the said block and adapted to be fixed between two points, and means arranged upon the block for moving it both in a transverse and longitudinal direction, substantially as shown and described.

2. In a carpet-stretcher, the combination with a block having prongs or bars upon its lower face, the upper face of said block having a guideway produced therein, said guideway having a rack-bar at one side, a bar sliding in the guideway, pivots carried by the said bar, said pivots being arranged one above the other and independent of each other, a rack-frame arranged upon the block and adapted to move in a direction transverse to the length of the block, and means for operating the said pivots whereby the block can be moved transversely and longitudinally, substantially as described.

3. In a carpet-stretcher, a block having bars or prongs upon its lower face and the adjustable and guide-covered to the ends of the block, substantially as and for the purpose described.

4. In a carpet-stretcher, the combination with a block having bars or prongs upon its under side and a guideway upon its upper side, said guideway having a rack-bar at one side, a bar sliding in the guideway and provided with pivots, pivots carried by the sliding bar, one above the other, said pivots being independent of each other, a rack-frame sliding across the face of the block, the uppermost of the pivots being adapted to engage the said rack-frame, said rack-frame being provided with

means for securing the same in a fixed position, and a pawl carried by the sliding bar for the purpose of locking the rack-frame, substantially as described.

5. In a carpet-stretcher, the combination with a block having bars or prongs upon its under face and a longitudinal guideway having a rack-bar at one side, a sliding bar working in the guideway, a pivot journaled on the sliding bar and adapted to engage the rack-bar of the block, a rack-frame carried by the sliding bar for engagement with the said rack-bar, a rack-frame extending across the face of the block and having a chain attached to one end and a pin at the opposite end, a housing attached to the sliding bar and subdividing the rack-frame, a piston arranged within the housing and rack-frame and adapted for engagement with the said rack-frame, a pawl pivoted to the housing and adapted to engage the rack-frame, and means for rotating the piston whereby the block is moved transversely and longitudinally as set forth.

699,106. ACETYLENE-GAS GENERATOR. OSCAR FALKEN-WALDE, Baltimore, Md., assignor of one-half to Charles F. Standish, Baltimore, Md. Filed Oct. 22, 1901. Serial No. 67,002. (No model.)

Claim.—In a gas-generating means of the character described, the combination with the water-holding tank, the bell or collector movable therein, a water seal for said bell, a carbide-holding magazine carried by the bell, a carbide cut-off controlled by the rise and fall of the bell, and an adjusting means for said cut-off, including a screw-chest, mounted on the bell-top, having an operating-handle outside the bell-top, a lever within said bell, connected with the screw-chest, and a flexible connection joining said lever and the cut-off device, substantially as shown and for the purpose described.

699,107. CRATE-PARTITION. CHARLES W. HILLENBRAND, Kansas City, Kans. Filed Jan. 22, 1902. Serial No. 69,257. (No model.)

Claim.—The combination of a crate having opposite slotted members, the slot 7 in one of said members having a notch 9 at each end thereof, a slot 1 having notches 4 in one end thereof, a transverse opening 5 in the opposite end thereof, and a pair of spring-steel catches, one end of each catch being firmly secured in said slot, and the opposite end of each catch being bent into said opening; the end of said slot provided with said catches being adapted to slide through said slot 7, substantially as described.

699,108. EXTRACTION OF METALS FROM ORES OR THE LIKE. BRYANT HOWE, San Francisco, Cal. Filed July 12, 1901. Serial No. 64,651. (No specimens.)

Claim.—1. The process of extracting metals from ores and the like, consisting in leaching the material containing the metal with a solution containing a quantity of free ammonia and a quantity of a cyanid salt.

2. A process of extracting metals from ores, consisting in pulverizing and leaching the ores or materials with a solution in which a cyanid salt and free ammonia are present and adding to the solution an oxidizing agent.

3. The process of extracting metals from ores, consisting in leaching the pulverized material with a solution containing a cyanid compound, a salt of ammonia, and an alkali capable of liberating ammonia from the salt.

4. The process of extracting metals from ores, consisting in leaching the pulverized material with a solution containing free ammonia and a cyanid salt, and afterward recovering the metal by precipitation.

699,109. CARRIER AND DRIVER. LOVELL L. KILHAM, Guilford, Conn., assignor, by direct and mesne assignments, to Federal Glass Company, Jersey City, N. J., a Corporation of New Jersey. Filed Oct. 26, 1901. Serial No. 64,886. (No model.)

Claim.—1. In an apparatus of the class described, endless carrier-balls, trays pivoted off center therein, wheels supporting the balls, tracks for the trays and having switches, and devices automatically tilting the traveling trays at a predetermined phase of the movement of the carrier, substantially as described.

2. In an apparatus of the class described, an endless carrier disposed in part for upward travel, trays pivoted to the carrier, tracks therefor, a shaft having arms arranged to engage the trays, and mechanism rocking the shaft for tilting the trays to automatically discharge their contents, substantially as described.

3. In an apparatus of the class described, an endless carrier disposed in part for upward travel, trays pivoted therein, tracks upon which said trays are moved, a rack-chest having arms arranged to engage and tip said trays in the phase of upward movement of said trays, a reciprocating crank-rod coupled to said shaft, and means operated by the carrier-driving mechanism whereby said rod is actuated, substantially as described.

4. In an apparatus of the class described, an endless traveling carrier, a driving-shaft, a power-transmitting wheel for operating said carrier loosely mounted on said shaft, and mechanism mounted on said shaft and engaging said wheel to rotate the same with said shaft and capable of rotating said wheel independently of said shaft, substantially as described.

5. In an apparatus of the class described, an endless traveling carrier, a driving-shaft, a power-transmitting wheel for operating said carrier loosely mounted on said shaft, a collar rigidly secured to said shaft to rotate therewith, and a gear mounted on said collar having its axis of rotation in a line other than that of said shaft and arranged to operate said wheel, substantially as described.

6. In an apparatus of the class described, an endless carrier, operating means whereby said endless carrier is moved, and independently-adjustable power-transmission devices comprised within said operating

means whereby said endless carrier may be adjusted independently of said operating means as an entirety.

7. In an apparatus of the class described, an endless carrier disposed in a zigzag course, trays coupled to the endless carrier, and tracks arranged to support the moving trays; said tracks being provided with spring-actuated switches operated by the trays and permitting the trays to follow different planes of the carrier.

8. In an apparatus of the class described, an endless carrier disposed partly in a zigzag course and in part having an upward movement, trays coupled to the endless carrier, and means for positively tilting the trays at the upward phase of movement of the carrier while retaining the upper surfaces of the trays upward to discharge the load.

699,110. INKING-ROLL FOR PRINTING-PRESS. JAMES P. HARRIS, Philadelphia, Pa., assignor, by direct and mesne assignments, of two-thirds to John L. Larson and Charles H. Day, Philadelphia, Pa. Filed Aug. 2, 1891. Serial No. 70,766. (No model.)

Claim.—1. In a printing-press, a carriage, an ink-roll shaft carried thereby and having a limited rotary movement relative thereto, an ink-roll rotatably mounted upon the said shaft, concentric rigid with said shaft, and tracks rotatably mounted upon said concentric.

2. In a printing-press, a carriage having a yoke, an ink-roll shaft rotatably mounted in said yoke and having steps or shoulders to limit the rotary movement thereof, an ink-roll rotatably mounted upon said shaft, concentric mounted upon said shaft at the ends of said roll, and tracks rotatably mounted upon said concentric.

3. In a printing-press, a carriage having yokes, an ink-roll shaft rotatably mounted in said yokes and provided with steps to limit the rotation thereof, an ink-roll rotatably mounted upon the said shaft, concentric rigidly secured to said shaft at the ends of said ink-roll, and tracks rotatably mounted upon said concentric.

699,111. COVERED ROLL. JOHN E. BELAVER, Cambridge, Mass., assignor of one-fourth to Charles F. Brown, Reading, Mass. Filed Aug. 20, 1891. Serial No. 72,827. (No model.)

Claim.—1. As an article of manufacture, a cushion composed of an elastic body provided with a plurality of pockets each having an elastic wall integral with said body, a closed bottom and a relatively rigid or inextensible entrance, the said elastic walls having contracted end-engaging portions, the extensibility of which is reduced by the said inextensible entrance, the diameter of said entrance being greater than that of said contracted portions.

2. As an article of manufacture, a cushion composed of an elastic body provided with a plurality of pockets each having an elastic wall and a closed bottom and relatively rigid or inextensible reinforcing material firmly secured to the elastic body and forming entrance of the pockets, the elastic walls of the cushions having contracted end-engaging portions, the extensibility of which is limited by said inextensible material.

3. The combination of a supporting-base, a plurality of pocket-engaging end members attached thereto and projecting therefrom, and a cushion composed of an elastic body provided with a plurality of pockets each having an elastic wall which is integral with said body, a closed bottom and a relatively rigid or inextensible entrance, the said elastic walls having contracted end-engaging portions, the extensibility of which is reduced by the said inextensible entrance, the diameter of said entrance being greater than that of said contracted portions.

699,112. STOP-MOTION FOR RIBBON-LOOMS. WILLIAM F. PAIR, Paterson, N. J., assignor of one-third to Jacob Cohen, Paterson, N. J. Filed Nov. 1, 1891. Serial No. 69,730. (No model.)

Claim.—1. In a loom, the combination of a support, a movable spring-pressed part carried by said support and arranged parallel with the bottom, means for moving said part to the support in its retracted position, said part being also movable laterally with reference to its direction of movement under pressure by the spring to disengage the securing means, and means for moving said part laterally, substantially as described.

2. In a loom, the combination of a movable part of the power-controlling mechanism of the loom arranged parallel with the bottom, the breast-beam, another part adapted to engage said first-named part to retract the same, a spring normally pressing said last-named part toward the first-named part, means for moving said last-named part to the breast-beam in its retracted position, said last-named part being also movable laterally to disengage the securing means, and means for moving said last-named part laterally, substantially as described.

3. In a loom, the combination, with the bottom, a suitable support and a spring-pressed movable part arranged parallel with the bottom and being a part of the power-controlling mechanism of the loom, of a shuttle-driving member mounted on said bottom, means for moving said part to the support in its retracted position, said part being movable laterally with reference to its direction of movement under pressure by the spring to disengage the securing means, cooperative parts, one of said parts being carried by said bottom and adapted to engage the other to move the same, operative connecting means between said first-named cooperative part and said member adapted to move said part out of alignment with the other cooperative part, and operative connecting means also between said other cooperative part and said part of the power-controlling mechanism, substantially as described.

4. In a loom, the combination, with a stationary part of the loom, of the power-controlling mechanism of the loom, a slide-rod mounted in said part and adapted to engage said mechanism to retract the same, a spring normally pressing said slide-rod toward said mechanism, means for moving said slide-rod in its retracted position, said slide-rod being movable laterally to effect its release and permit the spring to move the same, a block movably arranged in said part, pins interposed between said block and said slide-rod, and means for moving said block, substantially as described.

5. In a loom, the combination, with the bottom and with the power-controlling mechanism of the loom comprising a movable part, of the shuttle-driving rack arranged on said bottom, a reciprocating member also mounted on said bottom, and operative connecting means between said rack and said member adapted to transmit the movement of the rack-bar coincidentally to said member, said member being movable into and out of contacting opposition to said part, substantially as described.

6. In a loom, the combination, with the bottom and with the power-controlling mechanism of the loom comprising a movable part, of the shuttle-driving rack arranged on said bottom, a reciprocating member also mounted on said bottom, and operative connecting means between said rack and said member adapted to transmit the movement of the rack-bar coincidentally to said member and comprising gearing engaging said rack-bar and a connecting-rod between said member and the gearing, said member being movable into and out of contacting opposition to said part, substantially as described.

699,113. REEL-HOLDER FOR REEL-ATTACHING MACHINES. FREDERICK F. RAYMOND, M. Norton, Mass., assignor, by mesne assignments, to the United States Machinery Company, a Corporation of New Jersey. Filed July 12, 1891. Serial No. 69,541. (No model.)

Claim.—1. In a reel-attaching machine the combination of reel-driving devices movable from an overhead receiving to an underneath attaching position, with a reel-holder provided with fixed sides forming a socket to hold the reel and movable with said reel-driving devices from receiving to attaching position and also movable toward and from the reel-driving devices.

2. In a reel-attaching machine, the combination of the reel-driving device with a reel-holder attached thereto and movable lengthwise thereon, said reel-holder being hollow and having a socket at its outer end, of a shape corresponding with the shape of the sides of a reel-blank and

forming a socket to receive and hold the reel-blank in a position removed from the reel-driving device, and a section forming a sleeve having parallel sides, said sleeve being the shape and area in cross-section of said reel-driving device and adapted to slide thereupon, said sections forming a continuation of each other, as and for the purpose set forth.

3. In a reel-attaching machine, a reel-attaching arm or support and a reel-holder adapted to slide telescopically upon it, said holder being hollow and having a socket shaped to receive and support a reel-blank by its edge and a section having sides parallel with those of said arm or support whereby said holder is adapted to hold a reel-blank in a position removed from the end of said arm or support and to permit the movement of the arm or support relatively to the holder and the reel-blank in the act of attaching it.

4. In a reel-attaching machine, a reel-attaching arm having a hollow reel-holder slidably attached to its outer end, said reel-holder having a section forming a sleeve with parallel sides adapted to slide on said arm, and an outer enlarging section shaped to receive the sloping sides of a reel, and limit the entrance of the reel-blank therein, whereby each blank will be held in a predetermined position with relation to the arm during the reel-attaching operation, as set forth.

5. In a reel-attaching machine a plate having a continuous recess of adapted to receive the heads of reels projecting from a reel and serve as a driver therefor, in combination with means for holding the reel during the driving operation.

6. In a reel-attaching machine the plate having a continuous recess of adapted to receive the heads of reels projecting from a reel to be attached, in combination with a removable metal strip held in said recess, and means for holding the reel during the attaching operation, as and for the purpose set forth.

7. In a reel-attaching machine, a rotary head having one or more arms projecting therefrom each carrying at its outer end a reel-driving surface and a reel-holder projecting beyond said reel-driving surface and movable in relation thereto in the manner described, in combination with one or more arms also mounted upon said rotary head and each carrying at its extremity a top-rib-applying device, as and for the purpose set forth.

699,114. ROLLER-PRESS. ROBERT BRADSHAW, Paterson, N. J., assignor of one-half to William C. Huff, Paterson, N. J. Filed May 14, 1891. Serial No. 69,633. (No model.)

Claim.—1. In a roller-press, the combination with the pressing-rollers mounted in fixed bearings, the cooperating rollers mounted in movable bearings, means for holding the movable rollers against backward movement with a yielding pressure and means for feeding a hat in said rollers, of heads between which the hat is formed, sliding frames in which said heads are journaled, equalizing-bars connected with the frames for positioning the heads and frames, and links connecting opposite ends of the bars with the fixed and movable roller-frames respectively; substantially as described.

2. In a roller-press, the combination with the pressing-rollers mounted in fixed bearings, the cooperating rollers mounted in movable bearings, means for holding the movable rollers with a yielding pressure and means for feeding a hat to the rollers, of heads between which the hat is formed, sliding frames in which the heads are journaled, hand-wheels having screw-balls for withdrawing said heads from engagement with the hats, equalizing-bars pivotedly connected with the frames, and links connecting opposite ends of said bars with the fixed and movable roller-frames, whereby the ends of the heads is kept coincident with the axis of the hats; substantially as described.

3. In a roller-press for forming cylindrical hats, the combination with the side bars, vertically-extending roller-frames carried by the side bars, and rollers journaled in said roller-frames, of roller-frames connecting the roller-frames and the drive-shafts for the rollers extending through

said frames from one side of the press to the other; substantially as described.

4. In a roller-press for forming cylindrical hats, the combination with the side bars, vertically-extending frames carrying the pressing-rollers supported by the side bars and having yoke-shaped projections extending to one side of said bars, of a drive-shaft journaled in the yoke-shaped projections, pinions on said drive-shaft and gear-wheels for driving the rollers, located on the inner side of the yoke-shaped projections and meshing with said pinions; substantially as described.

5. In a roller-press for forming cylindrical hats, the combination with the main frame, the sliding roller-frame mounted thereon and the rollers journaled in said sliding frame, of the power-cylinder mounted on vertical transverse, and the piston working in said cylinder with a pivotal connection between the piston and sliding frame; substantially as described.

6. In a roller-press for forming cylindrical hats, the combination with the main frame, the sliding roller-frame mounted thereon and having the rollers loosely connected therewith to have a limited oscillation in a vertical plane, and the rollers journaled in said roller-frame, of the power-cylinder mounted on vertical transverse, and the piston working in said cylinder and connected with the said union; substantially as described.

7. In a roller-press adapted to receive a hat directly from the gin, the combination with the pressing-rollers and means for actuating the same, of a reversible accumulator-roll having teeth for picking up and severing the hat and means for rotating said accumulator-roll for winding the hat thereon during the covering of the previously-formed hat and means for elevating and turning said roll and for unlatching the same; whereby the accumulated hat is brought in contact with the moving hat as it is fed from the gin and unrolled thereby and fed to the press.

8. In a roller-press adapted to receive a hat directly from the gin, an accumulator-roll, a frame in which said roll is mounted pivoted on a center at right angles to the axis of the roll, a second frame on which said first frame is pivoted and bearings for supporting said second frame on an axis parallel with the axis of the roll; substantially as described.

9. In a roller-press adapted to receive a hat directly from the gin, an accumulator-roll, a frame in which said roll is mounted pivoted on a center at right angles to the axis of the roll, a second frame on which said first frame is pivoted, mounted to turn on an axis parallel with the axis of the roll and a reversing mechanism for the roll embodying a pinion connected with the roll-frame and a gear-wheel with which said pinion meshes, whereby the roll may be simultaneously elevated and reversed; substantially as described.

10. In a roller-press for forming cylindrical hats, the combination with the pressing-rollers between which the hats are formed, of a clamp through which the bagging is fed extending parallel with the pressing-rollers interposed between the bagging-supply reel and the hats and in po-

sition to drop a depending end to be caught by the rolls and drawn around the bale; substantially as described.

11. In a roller-press for forming cylindrical bales, the combination with the pressing-rollers and means for rotating the same, of a bagging-chain consisting of jaws between which the bagging is drawn, pivoted arms on which said jaws are mounted and a handle for swinging said arms and jaws whereby the bagging may be lowered into position to be caught by the rollers, and drawn around the bale and the jaws returned to normal position to leave a depending end for the next operation; substantially as described.

699,115. PROCESS OF BAILING COTTON. EDGAR BRAGAN, Florville, Tex., assignor of one-half to Walter C. Bruff, Florville, Tex. Filed Dec. 22, 1901. Serial No. 57,392. (No model.)

Claim.—1. The method of baling cotton which consists in heating the cotton-bat at a point between the gin-condenser and the pressing-roller, expelling said heated bat while incipient to the action of dry air, and finally compressing said bat into bale form.

2. The method of baling cotton which consists in heating the cotton-bat at a point between the gin-condenser and the accumulator-roll, winding said bat on said roll and expelling it to the action of dry air, and feeding said bat to the press-roller to form the interior of the bale.

699,116. DETONATING BOMB-ALARM. WILLIAM E. KEMP, Philadelphia, Pa., assignor of three-fifths to E. Russell Purvis, Philadelphia, Pa. Filed Jan. 14, 1902. Serial No. 58,774. (No model.)

Claim.—1. The combination of a frame, a swiveling cartridge-holder, pivoted at its rear end on which said cartridge-holder turns, a catch upon the frame for holding the cartridge-holder in position for firing the cartridge, and a plunger fitting in a vertical socket in said frame, and directed toward said cartridge substantially as described.

2. The combination of a frame, a swiveling cartridge-holder, pivoted at its rear end on which said cartridge-holder turns, a sliding catch attached to said frame, and having its edges turned over and fitted against the edge of the cartridge-holder, and holding the same in position for firing, and a plunger fitting in a vertical socket in said frame, and directed toward said cartridge substantially as described.

3. The combination of a frame, a swiveling cartridge-holder, a slide attached to said frame and having the edges turned over and fitted against

the sides of said swiveling cartridge-holder, said frame being provided at its lower end with a socket vertical in direction when the frame is suspended, and a plunger movable in said socket, substantially as described.

699,117. WARE-STOP-MOTION MECHANISM. WALLACE I. SEYMOUR, Hingham, Mass., assignor to Draper Company, Portland, Me., and Hopedale, Mass. Filed Dec. 11, 1901. Serial No. 58,685. (No model.)

Claim.—1. In a ware-stop-motion for looms, two opposed fixed brackets each having a vertical slot and a lateral web also provided with a vertical slot, a warp-supporting bar mounted in and vertically adjustable in the bracket-slots, a bolt extended through each end of said bar and the slot of the adjacent web, and a clamping-nut for each bolt, to maintain the bar in vertically-adjusted position.

2. In a ware-stop-motion for looms, two opposed fixed brackets each having a vertical slot and an adjacent lateral web, an inwardly-extended leg on each bracket above the slot, detector-supports having hooked ends and located at the back and front of said legs, a supporting and clamping bolt passed through each leg and on which the detector-supports are hooked, a warp-supporting bar having its ends extended through the bracket-slots, and means to clamp the ends of said bar in vertically-adjusted position on the adjacent webs.

3. In a ware-stop-motion for looms, two opposed fixed brackets each having a vertical slot and an adjacent lateral web, an inwardly-extended leg on each bracket above the slot, detector-supports detachably clamped to said legs at the back and front thereof, a vertically-adjustable warp-supporting bar extended through the bracket-slots, and means to clamp said bar at its ends to the adjacent webs.

699,118. DRIER. RUDOLF SCHMIDT, Berlin, Germany, assignor to Carl Binder, Chicago, Ill. Filed Apr. 17, 1901. Serial No. 58,573. (No model.)

Claim.—1. In a drier, the combination of a drying-chamber, a plurality of hollow, superimposed heating-chelves within said chamber, separately-ducted vertical supply and exhaust pipes extending into the interior of said chamber and without communication with the interior thereof, means of communication between said pipes and said shelves and contained wholly within said chamber, and standards supporting said shelves, substantially as and for the purpose set forth.

2. In a drier, the combination of a horizontally-disposed drying-cylinder, a plurality of horizontally-disposed heating-chelves, separately-ducted vertical supply and exhaust pipes passing into the interior of said

cylinder and having no communication with the interior of said cylinder, and laterally-ducted pipes connecting said shelves with said vertical pipes, substantially as described.

699,119. AUTOMATIC SIGNAL FOR ELECTRIC RAILWAYS. CHARLES E. SMITH, Watertown, Iowa, assignor to Ralph L. Smith, Watertown, Iowa. Filed Jan. 12, 1901. Serial No. 58,687. (No model.)

Claim.—1. A switch mechanism adapted to be moved by a trolley-wheel passing in either direction, two electromagnets, and terminals at opposite sides of the switch respectively in circuit with said magnets; combined with a circuit-breaker comprising two drums mounted on a common shaft and each having a contact-wheel, parts for said wheels actuated by the armatures of said magnets, flat springs also engaging said wheels for preventing retrograde movement, an insulated hub fast on one drum and standing between the two, mechanism whereby the drums are thrown into and out of electrical connection with each other through step-by-step rotation, a source of electrical power in circuit with one drum, and a circuit leading from the other drum through the work to be performed, as and for the purpose set forth.

2. A switch adapted to be moved by a trolley-wheel passing in either direction, two electromagnets, terminals at opposite sides of the switch, and electrical connections between them and the magnets; combined with a circuit-breaker comprising two drums mounted on a common shaft and one of them in electrical connection therewith, mechanism whereby said drums are rotated by step-by-step movement by the armatures of said magnets, an insulated hub fast on one drum and standing between the two, a disk between this hub and the other drum, a shoulder connecting the disk with the metallic face of its drum, a stud on the other drum adapted to be engaged by this shoulder, a projecting piece on the last-mentioned drum adapted to contact with the face of the other drum or to rest in an insulated space therein when the shoulder engages the stud, electrical connections between this piece and a source of power, and electrical connections between said stud and the work to be performed, as and for the purpose set forth.

3. A circuit-breaker consisting of a shaft in circuit with the work to be performed, two insulated drums mounted thereon and having metallic faces, one having an insulated space and the other being solid, a piece projecting from the solid face and adapted to rest on said broken face or stand in said space, mechanism for rotating said drums by step-by-step movement, an insulating-hub of smaller diameter than said and secured to the inner end of the drum which has the broken face, a disk at the inner end of this hub in electrical connection with the shaft, a metallic shoulder standing on the periphery of the hub and connecting its face with said disk, an insulating-disk in the inner end of the other drum adapted to be struck by said shoulder when the projecting piece stands on the insulation, a bush bearing on the insulation face of the last-mentioned drum, and electrical connections leading from this bush to a source of energy, as and for the purpose set forth.

4. In a block-signaling system, differently-colored lights at opposite ends of each block, these of one color at one end and being in circuit with those of a different color at the remote end, a switch in circuit with a source of energy and adapted to be moved in either direction by the passing trolley-wheel, and terminals at opposite sides of said switch; combined with a circuit-breaker consisting of two drums mounted on a common shaft and insulated from each other, electrically-operated mechanisms connected with said terminals for rotating said drums independently with a step-by-step movement, means for making and breaking electrical connection between the drums at certain points, positive mechanism for re-establishing this connection after it is broken, connections from a source of power to one drum, and connections from the other drum through one pair of signals to the ground, as and for the purpose set forth.

5. In a block-signaling system, differently-colored lights at opposite ends of each block, these of one color at one end and being in circuit with those of a different color at the remote end, a switch in circuit with a source of energy and adapted to be moved in either direction by the passing trolley-wheel, and terminals at opposite sides of said switch; combined with a circuit-breaker consisting of two drums mounted on a common shaft and insulated from each other, electrically-operated mechanisms connected with said terminals for rotating said drums independently with a step-by-step movement, means for making and breaking electrical connection between the drums at certain points, connections from a source of power to one drum, and connections from the other drum through one pair of signals to the ground, as and for the purpose set forth.

699,120. SHED-ARM FOR DOUBLE-CUTTING BAND-MILLS. EDWIN E. THOMAS, St. Paul, Minn., assignor of one-half to Union Iron Works, Minneapolis, Minn. Filed Aug. 20, 1901. Serial No. 73,542. (No model.)

Claim.—1. In a double-cutting band-mill, the combination, with a log-deck, of a carriage spaced therefrom, a lumber-conveyor, log stops and hitches, oscillating bridging means extending across said conveyor normally below its level, a single operating-bar within the control of the conveyor and means governed by the movement of said bar for opening said stops and hitches and bridging means simultaneously, or said bridging means independently of said stops and hitches, substantially as described.

2. In a band-mill, the combination, with the log stops and hitches, of the carriage and its truck spaced therefrom, a lumber-conveyor, oscillating child-arms, cylinders having their pistons connected respectively with said stops and hitches and said child-arms and provided with suitable valves, hams adapted to be actuated by the foot of the conveyor, one of said hams being provided with means for operating the other bar and operative connections provided respectively between said hams and said valves.

3. The combination, with a log-deck, of the carriage spaced therefrom, lumber-conveying rolls provided between said deck and carriage, a

with shaft, arms mounted on said shaft beneath said deck and having their free ends projecting across the space between said deck and carriage and normally below the level of said rolls, leg stops and hitches, cylinders having their pistons connected respectively with said rock-shaft and said leg stops and hitches and provided with suitable valves, here adapted to be actuated by the feet of the carrier, one of said bars being operable by the movement of the other and operative connections provided respectively between said bars and said valves.

4. In a double-cutting hand-mill, the combination, with the leg-deck, of a carriage spaced therefrom, a lumber-conveyor, leg stops and hitches, a rock-shaft, said arms thereon projecting across and normally below the level of said conveyor, a pedal-bar and means controlled by the movement of said bar for simultaneously operating said stops and hitches and rocking said shaft to raise said arms, substantially as described.

5. In a double-cutting hand-mill, the combination, with the leg stops and hitches, of a carriage and its track spaced therefrom, a lumber-conveyor, oscillating child-arms, cylinders having their pistons connected respectively with said stops and hitches and said child-arms, and provided with suitable valves, a pedal-bar within reach of the carrier, a second bar operated by the movement of the first, and operative connections provided respectively between said bars and said valves, substantially as described.

6. In a double-cutting hand-mill, the combination, with the leg-deck, of a carriage and track spaced therefrom, a lumber-conveyor provided between said deck and carriage, bridging means for said conveyor, a cylinder connected with said bridging means and having a suitable valve, a pedal-bar having a leg, a second bar engaged by said leg when said pedal-bar is depressed, a second cylinder connected with said stops and hitches and also having a valve, and operative connections provided between said bars and said valves respectively, substantially as described.

7. In a double-cutting hand-mill, the combination, with a leg-deck, of a carriage and track spaced therefrom, a lumber-conveyor between said deck and carriage, leg stops and hitches, child-arms projecting across said conveyor and normally below its level, means for operating said stops and hitches, independent means for operating said arms, a bar operatively connected with said stop and hitch operating means, and a pedal-bar having means for engaging and actuating said first-named bar when depressed, yielding means for holding and guiding said pedal-bar during its depression, and suitable connections provided between said pedal-bar and said child-arm-operating means, substantially as described.

8. In a double-cutting hand-mill, the combination, with the leg-deck, of a carriage and track spaced therefrom, a lumber-conveyor, oscillating leg stops and hitches, child-arms projecting across said conveyor normally below its level, means for operating said stops and hitches, independent means for operating said arms, a pedal-bar having means for engaging and actuating said first-named bar when depressed, yielding means for holding and guiding said pedal-bar during its depression, and suitable connections provided between said pedal-bar and said child-arm-operating means, substantially as described.

9. In a double-cutting hand-mill, the combination, with a leg-deck, of a carriage spaced therefrom, lumber-conveying rolls provided between said deck and carriage, oscillating child-arms supported beneath said deck and bridging the space between the same and said carriage and normally below the level of said rolls, leg stops and hitches near said child-arms, a pedal-bar, means controlled by the movement of said bar for operating said child-arms and said stops and hitches simultaneously, and means permitting the movement of said bar to cause the operation of said child-arms independently of said stops and hitches, substantially as described.

10. The combination, with a leg-deck, of a carriage and track spaced therefrom, lumber-conveying rolls provided between said deck and carriage, oscillating child-arms projecting across the space between said deck and carriage and normally below the level of said rolls, leg stops and hitches provided near said child-arms, means for operating said child-arms, means for operating said leg stops and hitches, and a single operating device for releasing with one movement said child-arms and said stop and hitch operating means to actuate them simultaneously or for releasing with a similar movement, said child-arm-operating means independently of said stop and hitch operating means.

11. The combination, with the leg stops and hitches, of a carriage and its track spaced therefrom, a lumber-conveyor, oscillating child-arms, cylinders having their pistons connected respectively with said stops and hitches and said child-arms and provided with suitable valves, an operating device within reach of the carrier, a second operating device operated by the movement of the first, and suitable connections provided respectively between said operating devices and said valves.

699,121. THOMAS-MACHINE. LEON D. VOSE, Omaha, Neb., assignor to Western Pulp and Paper Manufacturing Company, Omaha, Neb. Filed Oct. 23, 1901. Serial No. 69,590. (No model.)

Claim.—1. In a trucking-machine, the combination with a relatively fixed frame and loop-support, of a reciprocating element movable to and from the frame, a plunger to enter the frame and radially expand the staves of the work, said plunger being movable with and independently of the reciprocating element, and means to release the plunger from the interior of the work, prior to the retraction movement of the reciprocating element, substantially as described.

from the frame, a plunger to enter the frame and radially expand the staves of the work, said plunger being movable with and independently of the reciprocating element, and means to release the plunger from the interior of the work, prior to the retraction movement of the reciprocating element, substantially as described.

2. In a trucking-machine, the combination with a relatively fixed frame and loop-support, of a reciprocating element movable to and from the frame, and having means to engage the upper ends of the staves of the work and limit the outward radial movement thereof, a plunger, carried by the said element, to enter the work and radially expand the staves thereof, and means to release the plunger from the interior of the work prior to the retraction movement of said reciprocating element, substantially as described.

3. In a trucking-machine, the combination with a relatively fixed frame and loop-support, of a reciprocating element movable toward and from the frame, a cap-plate, carried by said reciprocating element, to engage the upper ends of the staves of the work, and having an annular flange to fit around the upper edge of the work, and limit the radially-expansive movement of the staves, and a plunger carried by the said reciprocating element and movable independently thereof, to enter the work and radially expand the staves, substantially as described.

4. In a trucking-machine, the combination of a plunger and a frame and loop-support, the one movable toward and from the other, means to cause the plunger to enter and engage the interior of the work in the frame and loop-support, displacing means to engage and over the outer ends of the staves, and means to release the plunger from the interior of the work prior to the disengagement of the stave-expanding means, substantially as described.

5. In a trucking-machine, the combination of a relatively fixed frame and loop-support, a reciprocating element movable toward and from the frame, a yieldably-mounted cap-plate, carried by the frame, to engage and over the upper ends of the staves and having an annular flange, to limit the expansive radial movement of the staves, and a plunger carried by said reciprocating element, and movable independently thereof, to enter the work, and radially expand the staves, substantially as described.

6. In a trucking-machine, the combination of a frame-carrier, a reversible element, slide-yokes connected thereto and reciprocated thereby, guides for said slide-yokes, a cross-head engaged and operated toward and from the frame by said slide-yokes, lost motion being provided between said slide-yokes and said cross-head, and a plunger carried by and movable independently of said cross-head, substantially as described.

7. In a trucking-machine, the combination of a radially-expandible plunger, and a first loop-support, the one movable toward and from the other, displacing means to engage and over the outer ends of the staves, and means to release the plunger from the interior of the work prior to the disengagement of the stave-expanding means, therefore, substantially as described.

8. In a trucking-machine, the combination of a frame-carrier, a reciprocating element movable toward and from the frame, a plunger operated by said reciprocating element, means to operate said frame-carrier to

bring a frame carried thereby into and out of the path of the plunger, means to operate said reciprocating element, a power element, and means to alternately engage the same with said operating means, substantially as described.

9. In a trucking-machine, the combination of a reversible frame-carrier, a reciprocating element movable toward and from a frame on said carrier, means to rotate said frame-carrier to bring a frame carried thereby into and out of the path of the plunger, means to operate said reciprocating element, a power element and means to lock said frame-carrier against rotation, said power element being automatically alternately engaged with said frame-carrier and reciprocating-element-operating means, by said means for locking said frame-carrier, substantially as described.

699,122. MILLING-MACHINE. DANIEL WARDEN, Boston, Mass., assignor of one-half to John W. Ward, Brooklyn, N. Y. Filed Feb. 21, 1901. Serial No. 69,510. (No model.)

Claim.—1. In a drilling-machine, a duplex drill consisting of inner and outer concentric drill members, in combination with mechanism for simultaneously imparting a reciprocatory movement only to one drill member and a combined rotary and reciprocatory motion to the other drill member.

2. In a drilling-machine, a duplex drill consisting of inner and outer concentric drill members, in combination with mechanism for simultaneously imparting a combined reciprocatory and rotary motion to the inner drill member, and a reciprocatory movement only to the outer drill member.

3. In a drilling-machine, outer and inner concentric drill members, in combination with mechanism for simultaneously imparting rotary motion to the inner drill member and reciprocatory motion only to the outer drill member, the outer drill member having a guide-chamber through which the shaft of the inner drill member passes, and an enlarged jacket in which works the cutting head or bit of the inner drill member.

4. In a drilling-machine, outer and inner concentric drill members, in combination with mechanism for simultaneously imparting motion to the drill members in different directions, said mechanism comprising independent cables connected respectively to the inner and outer drill members, and operating means for said cables.

5. In a drilling-machine, the combination with inner and outer drill members, of a walking-beam operatively connected to both of said members to reciprocate them simultaneously in opposite directions, and means for operating the walking-beam.

6. In a drilling-machine, outer and inner concentric drill members, in combination with mechanism for simultaneously imparting motion to the drill members in different directions, the said mechanism comprising a walking-beam, cables connected with said walking-beam, and also with the drill members, and an operating-chamber for actuating the walking-beam.

7. In a drilling-machine, the outer and inner concentric drill members, in combination with mechanism for simultaneously imparting motion to the drill members in different directions, said mechanism comprising a

walking-beam, means for driving the walking-beam, and cables connected with the drill members and having an adjustable connection with the walking-beam.

8. In a drilling-machine, outer and inner concentric drill members, in combination with mechanism for simultaneously imparting motion to the drill members in different directions, a walking-beam, a driving-chamber for actuating the walking-beam, a drum, a cable wound thereon and connected to one of the drill members, means actuated by the driving-chamber for rotating said drum, and clutch mechanism for throwing the drum-actuating device into and out of operation.

9. In a drilling-machine, outer and inner concentric drill members, in combination with mechanism for simultaneously imparting motion to the drill members in different directions, said mechanism comprising operating-cables connected to the drill members, and a ball connected with the outer drill member to provide for the attachment of one of the cables thereto.

10. In a drilling-machine, outer and inner concentric drill members, and a revolved-head connected to the shaft of the inner drill member, in combination with mechanism for simultaneously imparting motion to the drill members in different directions, said mechanism comprising cables, one of which is connected to the revolved-head on the shaft of the inner member, and the other to a ball on the outer member.

11. In a drilling-machine, the combination with inner and outer drill members, of operating mechanism common to said members for effecting their simultaneous reciprocation in opposite directions to cause said members to strike alternate thrust blows during the drilling operation.

12. In a drilling-machine, the combination with inner and outer drill members, of operating means common to said members for effecting their simultaneous reciprocation in opposite directions and for rotating the inner drill member.

13. In a drill, the combination with inner and outer drill members, of mechanism for rotating the inner drill member only and for effecting the simultaneous reciprocation of the inner and outer drill members in opposite directions, whereby the unsupported walls of the cavity will be broken down by the outer drill member after the inner drill member has been withdrawn from said cavity.

14. In a drilling-machine, the combination with inner and outer drill members, of a walking-beam, a cable connected to the walking-beam at one side of its fulcrum and extended directly to one of the drill members, a cleave located beyond the end of the other drill member, a second cable connected to the walking-beam and passed around the cleave for connection with the last-named drill member, and means for oscillating the walking-beam to effect the simultaneous reciprocation of the drill members in opposite directions.

15. In a drill, the combination with inner and outer drill members, of a walking-beam operatively connected to said drill members to effect their simultaneous reciprocation in opposite directions, and means for imparting a rotary movement to one only of the drill members during the reciprocation thereof.

16. In a drill, the combination with inner and outer drill members, of a walking-beam operatively connected to said drill members to effect the simultaneous reciprocation thereof in opposite directions, and driving mechanism disposed to effect the rotary movement of one only of the drill members and to oscillate the walking-beam.

17. In a drill, the combination with inner and outer drill members, of a walking-beam operatively connected to said members to effect their simultaneous reciprocation in opposite directions, a beveled-pinion mounted on one of said drill members to rotate said member, but having sliding engagement therewith, a driving-shaft geared to said beveled pinion, and mechanism geared to said driving-shaft and operatively connected to the walking-beam to oscillate the latter.

18. In a drill, the combination with inner and outer drill members, of a walking-beam connected to said drill members to effect their simultaneous reciprocation in opposite directions, a driving-shaft, gearing interposed between the driving-shaft and one of the drill members to effect the rotary movement of the latter, a counter-shaft geared to the driving-shaft, and a link concentrically connected to the counter-shaft and having an operative connection with the walking-beam.

699,123. JOINTED GRATE-FRONT AND ROVE. CHARLES F. WILSON, Chattanooga, Ky., assignor, by direct and mesne assignments, to Ohio City Stone Works, Incorporated, Chattanooga, Ky., a Corporation of Kentucky. Filed May 11, 1901. Serial No. 69,591. (No model.)

Claim.—1. In a heater of the character described, the combination with a fire-wall and a back wall defining an intermediate hot-air flue, of a partition disposed in advance of the fire-wall at the lower end thereof and defining an intermediate burner-chamber constituting a continuation of the hot-air flue, a series of burner-tubes located within the burner-chamber and in communication with a source of gas-supply, said burner-cham-

ber being provided with a constricted opening at its upper end through which the burner-tubes extend, whereby the combustion produced at the upper ends of the burner-tubes will induce a circulation of air around the fire-wall, through the hot-air flue, into the burner-chamber, and around the burner-tubes for redelivery at the point of ignition.

2. In a heater of the character described, the combination with a fire-wall and a back wall defining an intermediate hot-air flue, of a partition located in advance of the lower end of the fire-wall to define an intermediate burner-chamber constituting a continuation of the hot-air flue, a series of burner-tubes located within the burner-chamber and extended through a constricted opening at the upper end thereof, a gas-cylinder supporting the burner-tubes and in communication with a source of gas-supply, a mixer located within the burner-chamber at a point above the gas-cylinder and having communication with the tubes and with the interior of the burner-chamber, respectively, whereby the combustion produced at the upper ends of the burner-tubes will induce a recirculation around the fire-wall and through the hot-air flue to the interior of the burner-chamber to cause the heated air to circulate around and heat the gas-cylinder, part of the heated air then passing into the mixing-chamber, and another part passing around the mixing-chamber and around the burner-tubes for redelivery at the point of ignition.

3. A heater of the character described having an open front and provided at its opposite sides with separate non-communicating vertically-disposed cold-air chambers defined between inner and outer walls connected at their front ends by a damper-escape, and at their rear ends by an apertured rear end wall, a fire-wall and a back wall defining an intermediate hot-air flue at the back of the heater, a gas-burner located in front of the fire-wall at the lower end thereof, to effect a circulation around the fire-wall for the purpose specified, and dampers located within the damper-escape to control the circulation of air through the cold-air chambers.

4. A heater of the character described having an open-front combustion-chamber defined between cold-air chambers located at the opposite sides of the heater and having inner and outer walls connected at their front edges by apertured cylindrical damper-escapes, and at their rear ends by apertured rear end walls, a fire-wall and a back wall disposed transversely between the cold-air chamber and defining a hot-air flue at the back of the heater, a gas-burner located in front of the fire-wall at the lower end thereof, to effect a circulation around the fire-wall for the purpose specified, and rotary dampers mounted within the damper-escapes and designed to control the circulation of air through the cold-air chambers.

5. A heater of the character described, having an open-front combustion-chamber defined between cold-air chambers at its opposite sides and a hot-air flue at its back, inner and outer walls defining the cold-air chambers and connected at the front of the heater by damper-escapes, and at the back of the heater by apertured rear end walls, a fire-wall and a back wall located at the back of the heater and constituting the opposite walls of the hot-air flue, a gas-burner located in front of the fire-wall at the lower end thereof, to effect a circulation of air around the fire-wall for the purpose specified, dampers located within the damper-escapes to control the circulation of air through the cold-air chambers, and a removable casing having an open front and designed to inclose the heater to convert the latter into a stove.

6. In a heater of the character described, the combination with inner and outer side walls defining cold-air chambers at the opposite sides of the heater, of apertured cylindrical damper-escapes located at the front ends of the cold-air chambers and extended above the heater, a fire-wall and a back wall defining an intermediate hot-air flue extending between the rear ends of the cold-air chambers, a gas-burner located in front of the fire-wall at the lower end thereof, a head provided with thinkies fitting over the upper ends of the damper-escapes, and apertured dampers within the damper-escapes.

7. In a heater of the character described the combination with inner and outer side walls defining cold-air chambers located at opposite sides of the heater, of apertured cylindrical damper-escapes disposed at the front

ends of the cold-air chambers and extended above the heater, a fire-wall and a back wall defining a hot-air flue extending between the rear ends of the cold-air chambers, a gas-burner located in front of the fire-wall at the lower end thereof, a head provided with thinkies fitting over the upper ends of the damper-escapes, apertured dampers within the damper-escapes, and a stove-casing detachably retained by the head.

8. In a heater of the character described, the combination with inner and outer side walls defining cold-air chambers at opposite sides of the heater, of apertured cylindrical damper-escapes located at the front ends of the cold-air chambers, apertured rear walls defining the rear ends of said chambers, a head connecting the upper ends of the damper-escapes, cylindrical dampers located within the damper-escapes, damper-actuating devices connected with the dampers and located above the head, a fire-wall extending between the cold-air chambers at the rear ends thereof, and a gas-burner located in front of the fire-wall.

699,134. RAILWAY-RAIL JOINT. IVAN LYON, Troy, N. Y. Filed Sept. 8, 1891. Serial No. 74,959. (No model.)

Claim.—1. In a railway-rail joint, the combination with lengthwise adjacent rails, of a splice-plate comprising members secured to the respective rails a member to each and connected by a hinge-joint between endwise contiguous members on one and the same side of the rails, substantially as described.

2. In a railway-rail joint, the combination with lengthwise adjacent rails, of a splice-plate comprising members secured to the respective rails a member to each and connected by a hinge-joint between endwise contiguous members on one and the same side of the rails, said joint comprising a boss on one member and a recess on the other member to receive said boss, substantially as described.

3. In a railway-rail joint, the combination with lengthwise adjacent rails, of a splice-plate comprising members secured to the respective rails a member to each and connected by a hinge-joint between endwise contiguous members on one and the same side of the rails, and a chair to maintain the inner end of each member when the outer portion of its corresponding rail is elevated, substantially as described.

4. In a railway-rail joint, the combination with lengthwise adjacent rails, of a pair of splice-plates each pair comprising members secured to the respective rails a pair of members to each and the members of each connected by a boss in one fitting a recess in the other, and a chair, substantially as described.

699,135. WHEEL ATTACHMENT. THOMAS GIBB, Waterville, N. Y. Filed Oct. 7, 1892. Serial No. 77,572. (No model.)

Claim.—1. An attachment for wheels comprising a hub-band adapted to be applied to a wheel after the latter has been constructed, and the radial bracing-rods extending from the hub-band to the rim of the wheel

and secured to the latter, said bracing-rods also engaging the hub of the wheel and retaining the band thereon, substantially as described.

2. An attachment for wheels comprising a hub-band adapted to be applied to a wheel after the same has been constructed and provided at intervals with sockets, and radial bracing-rods secured at their inner ends in the sockets and provided at their outer ends with clips for engaging the rim of a wheel, substantially as described.

3. An attachment for wheels comprising a hub-band adapted to be applied to a wheel after the same has been constructed and provided with threaded openings extending entirely through it, the bracing-rods having threaded inner ends to screw into the openings of the band and provided at their outer ends with clips approximately U-shaped to conform to the configuration of and form seats for the fully-sections, and fastening devices for securing the clips to the fully-sections, substantially as described.

4. An attachment for wheels comprising a hub-band, provided with threaded openings, the radial bracing-rods having threaded inner ends to engage the threaded openings and provided at their outer ends with clips arranged to receive the fully-sections of a wheel, and transverse fastening devices for securing the clips to the fully-sections, substantially as described.

REISSUES.

11,981. BAKING-POWDER. JOHN A. JON, Syracuse, N. Y., assignor of one-half to D. H. Barrell & Company, Little Falls, N. Y., a firm. Filed Apr. 3, 1898. Serial No. 101,597. Original No. 692,432, dated Feb. 4, 1892.

Claim.—1. The herein-described highly-acid composition of matter consisting of phosphoric acid and caustic, containing phosphoric acid largely in excess of the amount which is contained in acid phosphate of caustic and being dry, non-hygroscopic and soluble in water.

2. The herein-described composition of matter consisting approximately of twenty-four parts, by weight, of phosphoric acid and seventy-six parts of caustic.

3. A baking-powder composed of a carbonate, a filler and the herein-described composition of caustic and phosphoric acid, containing phosphoric acid largely in excess of the amount which is contained in acid phosphate of caustic and being dry, non-hygroscopic and soluble in water.

4. A baking-powder composed of a carbonate, a filler and the herein-described composition of caustic and phosphoric acid, composed approximately of twenty-four parts, by weight, of phosphoric acid and seventy-six parts of caustic.

DESIGNS.

85,889. HANDLE FOR SPOONS OR SIMILAR ARTICLES. BENJ. BELL, St. Louis, Mo. Filed Feb. 17, 1892. Serial No. 84,908. Term of patent 14 years.

Claim.—The design for the handle of a spoon or similar article substantially as herein shown and described.

85,898. HINDALLION. CHARLES W. PARK, New York, N. Y. Filed Feb. 11, 1892. Serial No. 85,898. Term of patent 7 years.

Claim.—The design of a Hindallion herein shown and described.

85,894. ORNAMENTAL SHIELD. RICHARD A. KELLY, New York, N. Y., assignor to Marcus T. Goldsmith, New York, N. Y. Filed Apr. 3, 1892. Serial No. 101,561. Term of patent 7 years.

Claim.—The design for an ornamental shield, substantially as herein shown and described.

85,895. ORNAMENTAL SHIELD. RICHARD A. KELLY, New York, N. Y., assignor to Marcus T. Goldsmith, New York, N. Y. Filed Apr. 3, 1892. Serial No. 101,562. Term of patent 7 years.

Claim.—The design for an ornamental shield, substantially as herein shown and described.

85,886. FOOT OF TYPE ORNAMENTS. BENJ. HARRIS, Kingston-upon-Thames, England, assignor to the Linotype Company, Limited, London, England. Filed Jan. 26, 1892. Serial No. 81,508. Term of patent 14 years.

Claim.—The design for a foot of type ornaments, substantially as herein shown and described.

85,887. FOOT OF TYPE ORNAMENTS. BENJ. HARRIS, Kingston-upon-Thames, England, assignor to the Linotype Company, Limited, London, England. Filed Jan. 26, 1892. Serial No. 81,509. Term of patent 14 years.

Claim.—The design for a foot of type ornaments, substantially as herein shown and described.

85,988. TOOL-STAND. HANLEY & SMITH, Cleveland, Ohio, assignors to Cleveland Twist Drill Co., Cleveland, Ohio, a firm. Filed Feb. 20, 1902. Serial No. 94,391. Term of patent 14 years.

Claim.—The design for a tool-stand, as herein shown and described.

85,989. ORNAMENTAL BORDER. JOHN E. KATZ, Philadelphia, Pa., assignor to Blue Print Air Company, Philadelphia, Pa., a Corporation of Pennsylvania. Filed Mar. 12, 1902. Serial No. 94,392. Term of patent 7 years.

Claim.—The design for an ornamental border, as shown and described.

TRADE-MARKS

REGISTERED APRIL 29, 1902.

88,179. MAGAZINE. RICHARD G. SMITH, New York, N. Y. Filed Apr. 1, 1902.

**MUNICIPAL
AFFAIRS**

Essential feature.—The word "MUNICIPAL AFFAIRS." Used since April, 1897.

88,180. CERTAIN MARKED PAPER. GEORGE W. WEAVER, New York, N. Y. Filed Apr. 2, 1902.

Essential feature.—The phrase "THE SPIRIT OF OUR FOREFATHERS" and the representation of hand-arms. Used since March 1, 1902.

88,181. CERTAIN MARKED PAPER. GEORGE W. WEAVER, New York, N. Y. Filed Apr. 2, 1902.

Essential feature.—The compound word "SUMMER-TIME," the representation of a female figure, and flowers emblematic of summer-time. Used since January 1, 1902.

88,182. CERTAIN MARKED PAPER. GEORGE W. WEAVER, New York, N. Y. Filed Apr. 2, 1902.

Essential feature.—The words "TRUE BLUE" and the representation of an Indian fighting scene. Used since March 1, 1902.

88,183. CERTAIN MARKED PAPER. GEORGE W. WEAVER, New York, N. Y. Filed Apr. 2, 1902.

Essential feature.—The words "PLAY FAIR" and the representation of card-players. Used since January 1, 1902.

88,184. CERTAIN HAKED PARRICK. GENERAL WELLS, New York, N. Y. Filed Apr. 3, 1902.

Essential feature.—The word "KNAPSACK" and the representation of a bivouac scene. Used since December 1, 1901.

88,185. CERTAIN HAKED DRY GOOD. BROWN CRAWFORD Co., New York, N. Y. Filed Jan. 20, 1902.

Essential feature.—The representation of a Scotch plaid with a border of Scotch thistle. Used since January 22, 1902.

88,186. REPUCCATED NIGHT-GARMENTS. R. R. R. & Co., Baltimore, Md. Filed Mar. 20, 1902.

MAJAMA

Essential feature.—The word "MAJAMA." Used since February 1, 1902.

88,187. TEXTILE COOLING AND WARMING. THE COOL MAKING, Boston, Mass. Filed Sept. 27, 1901.

EVER

Essential feature.—The word "EVER." Used since April, 1907.

88,188. BROWN-GRAVE, GARMENT-SUPPLIES, AND COLLAR FOUNDATIONS. A. A. DUNN & Co., Boston, Mass. Filed Mar. 13, 1902.

TREKANO

Essential feature.—The word "TREKANO." Used since February 18, 1902.

88,189. BOOKS AND EYES. THE VISION & KLAS Co., Washington, Del., and Chicago, Ill. Filed Mar. 26, 1902.

U PIN IT

Essential feature.—The words "U PIN IT." Used since June 1, 1901.

88,190. SHOWN. C. W. SHAW, Paterson, N. Y. Filed Mar. 4, 1902.

Essential feature.—The words "THE BUFFER" and the representation of a buffer in connection with a couple. Used since February 3, 1902.

88,191. POCKET-BOOK, BAG, BELT, FURBER AND PANTY LEATHERS. ROVELTINE. BARNETT AND POLLOCK, New York, N. Y., and Hoboken, N. J. Filed Jan. 20, 1902.

Essential feature.—The representation of an artisan's square inscribing the letters "R & P" in monogram form. Used since January 2, 1902.

88,192. GOLD-CHEM. DANNETT & RANWELL, New York, N. Y. Filed June 20, 1901.

Essential feature.—The representation of an irregular oblong panel, plate, or shield with a narrowed band or border, having a cross-band at each end, the lower half of the panel, plate, or shield casting a dark shadow, thereby giving to the whole figure the appearance of thickness or depth, the panel, plate, or shield being also surrounded by shading, presenting a cloud-like effect. Used since January 1, 1900.

88,193. GARMENTING. JOHN HADEN, New York, N. Y. Filed Feb. 20, 1902.

Essential feature.—The representation of a crown with the shield-like letter "M," the words "AR-ORPTA-Cio," and the words "SMART ERY." Used since January 24, 1902.

88,194. HAKED CASE AND HAKED WHEAT. THE HAKED Case Co., Lansing, Eastport, Mich. Filed Feb. 6, 1902.

NORKA

Essential feature.—The word "NORKA." Used since January 1, 1902.

88,195. AIR. ADAM SHAWT BROWN COMPANY, Eastport, Pa. Filed Jan. 3, 1902.

Essential feature.—The representation of two personifications of land, a body of water separating the same, the sun rising above the horizon and having rays radiating therefrom, and a wireless-telegraph apparatus upon each personification, the two being connected by a field of electric sparks, upon which appear the words "TWENTIETH CENTURY." Used since December 20, 1901.

88,196. BATTERY. L. GARDNER & COMPANY, New York, N. Y. Filed Feb. 14, 1902.

Essential feature.—The representation of medallions of George Washington and Christopher Columbus, accompanied by the names of the persons represented. Used since June 1, 1901.

88,197. TOWN AND BLOOD-VITALIZER. GARDNER BROTHERS Co., Eastport, Mich. Filed Dec. 1, 1901.

Ren-Car-Ta

Essential feature.—The word "REN-CAR-TA," the representation of a heart, and the photograph of Dr. Philo Greene in the center of the heart, and the signature of "PHILO GREENE, M. D." underneath the heart. Used since July 1, 1901.

88,198. REMEDY FOR CERTAIN HAKED DERMATIS. GARDNER & BROWN, Lowell, Mass. Filed Dec. 4, 1901.

Essential feature.—The words "FATHER JOHN'S" and a bust-portrait, in form of a medallion, of the Rev. John O'Brien, deceased. Used since December, 1900.

88,199. REMEDY FOR CERTAIN HAKED DERMATIS. BROWN & BROWN, Boston, U. S. C. Filed Mar. 20, 1902.

R.P.H.

Essential feature.—The letters "R. P. H." Used since March 20, 1902.

88,200. DIPHTHERIA REMEDY. HARRIS H. FAIRBANKS Co., Inc., Maine. Filed Mar. 24, 1902.

Essential feature.—The representation of a flag and the letters "M F D." Used since July 26, 1907.

88,208. FIREPROOF CEMENTS FOR FURNACES. H. W. JOHNS-
MANVILLE COMPANY, New York, N. Y. Filed Apr. 2, 1902.

Essential feature.—The word "FIBRITE." Used since March 1, 1902.

88,909. SEAL-PRUNING AND SOFT-MENTAL SEALS. EXTENSIVE
SEAL & PRUN COMPANY, New York, N. Y. Filed Mar. 26, 1902.

KEYSTONE

Essential feature—The word "KEYSTONE." Used since July 1, 1927.

88,910. TORJEDOM. Lewis J. Moore, Brewer, Mo. Filed Mar. 29, 1902.

IRONCLAD

88,211. CERTAIN NAMED FISHING-TACKLE. EMERY MILWARD
100, Upper Richmond Road, England. Filed Mar. 12, 1902.

IRON ARM

Essential feature.—The words "IRON ARM." Used since 1880.

88,212. ALUMINUM GAS BURNER TIPS. GAS TIP AND GASKET
Lantern Co., New York, N. Y. Filed Mar. 27, 1908.

Essential feature.—The word "BRILLIANT" and the representation of a gas-burner tip with rays radiating therefrom. Used since January 1, 1902.

88,918. CERTAIN NAMED DEVICES USED IN WIRELESS TELEPHONY AND TELEGRAPHY, FEDERAL WIRELESS TELEPHONE & TELEGRAPH Co., Philadelphia, Pa. Filed Feb. 12, 1902.

AEROGRAF

Essential feature.—The word "ANNOGRAM." Used since Jan-
uary 25, 1902.

88,214. MACHINES FOR APPLYING OR PASTING LABELS.
 JOHN DEERE WAGON & LAMINATE Co., Dubuque, Iowa. Filed Mar.
 28, 1922.

Empire

Essential feature.—The word "EXPENSE." Used since February.

DECISIONS
OF THE
COMMISSIONER OF PATENTS
AND OF
UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

DAVIS v. SWIFT.

Decided March 27, 1902.

1. INTERFERENCE—DISSOLUTION IN VIEW OF REFERENCES—RE-
JOY—APPEAL OR AMENDMENT.

Where an interference is suspended under Rule 128 and a decision is rendered dissolving the interference in view of newly-discovered references, Held that the parties may appeal to the Examiners-in-Chief within the limit of appeal or may permit the decision to become final and then amend the claims to avoid the references.

2. SAME—APPEAL—AMENDMENT NOT PERMITTED.

Where a party has appealed to the Examiners-in-Chief from a decision dissolving the interference, Held that he cannot amend his claims until that appeal is disposed of either by a decision or by being withdrawn.

ON petition.

PERFORATED MUSIC-SHEETS FOR MECHANICAL MUSICAL INSTRUMENTS.

Application of George H. Davis filed December 15, 1900, No. 40,088. Application of George Swift filed March 9, 1900, No. 8,052.

Mr. William H. Howies and Mr. W. A. Bartlett for Davis.

Mr. E. H. Brown for Swift.

ALLEN, Commissioner:

This case comes before the Commissioner on a petition by Swift that "his application be returned to the Primary Examiner for the purpose of amending his application."

It appears from the record that after the declaration of the above-entitled interference new references were discovered by the Primary Examiner, who then requested suspension of the interference under the provisions of Rule 128 for the purpose of determining the pertinency and effect of these references, upon consideration whereof the Examiner held the issue to be anticipated in the prior art and dissolved the interference, following the practice laid down in *Macey v. Tobey v. Lansing*, (97 O. G., 1172.) A limit of appeal of twenty days was fixed from his decision. On February 24, 1902, before the expiration of this limit of appeal, Swift appealed to the Examiners-in-Chief, and on March 6, 1902, his present petition was filed. In this petition he asks that his application be returned to the Primary Examiner in order that he may amend his application so as to avoid the references and render an appeal to the Examiners-in-Chief unnecessary.

59 O. G.—5—11

After the Examiner in a case of this sort has rendered his decision that the subject-matter of the issue is unpatentable two courses are open to the parties.

First, within the time limit fixed they may appeal to the Examiners-in-Chief, since the Examiner's holding that the matter in issue is unpatentable has somewhat the effect of a final rejection under Rule 68. In this case the interference is not dissolved and both parties may appear and be heard.

If, on the other hand, they allow the time limit to expire without taking such an appeal, the decision of the Examiner becomes final and the interference is dissolved. Thereafter the consideration of the applications is necessarily *ex parte*. The applicants under these circumstances have lost their right to appeal from the dissolution of the interference; but they still have, under the rules, a right to amend the rejected claims, since these claims have not been twice rejected, as is required by Rule 68, in order to bar the right to further amendment.

In the case now under consideration Swift has elected to pursue the first course and has filed an appeal to the Examiners-in-Chief. Under these circumstances the interference is continued, and Swift cannot amend his application. (See Rule 130.)

Having elected to prosecute his case by way of appeal, he cannot amend unless this appeal is withdrawn and the Examiner's decision dissolving the interference allowed to become final.

The petition is denied.

EX PARTE KING.

Decided April 15, 1902.

DIVISION—MACHINE AND ARTICLE—UNNECESSARY DRAWINGS AND DESCRIPTION SHOULD BE CANCELED.

Where division is required between a machine and the article made by it and the claims are limited to the article, Held drawings and description of the machine which are unnecessary to a complete disclosure of the article render the disclosure prolix and should be canceled.

ON petition.

TUBULAR STRAPERS AND BELTS FOR MACHINERY.

Application of John H. King filed May 11, 1901, No. 59,735.

Messrs. Murray & Murray for the applicant.

ALLEN, Commissioner:

This is a petition from the Examiner's require-

1109

ment to cancel Figures 1 to 5, inclusive, from the drawing and all reference thereto in the specification.

The application as originally filed contained a description and claims covering, respectively, a machine, a process, and a product. The drawing contains nine figures, the first five disclosing the machine and certain of its parts and the last four disclosing the product.

Division was required, and in response thereto the petitioner canceled the claims for the machine and the process, retaining in the application the claims for the product. He has refused, however, to cancel the description of the machine from the specification and the illustration thereof from the drawings.

The Examiner holds that the description of the machine is not essential to a full and complete understanding of the invention claimed and its retention renders the description unnecessarily prolix.

The petitioner argues that—
the statute requires the inventor to give such a full and exact description of his invention in his specification as to enable the public to practice the invention therefrom.

It is stated in the petition as a reason for retaining the description and illustration of the machine in the application—that in Figs. 1 and 5 he has shown the best and only means known to him of making the article.

The statute, section 4888, requires that the description of the invention shall be—

“ . . . in such full, clear, concise and exact terms as to enable any person skilled in the art or science to which it appertains to make, construct . . . and use the same.”

Rule 50 provides that—
the drawing must show every feature of the invention covered by the claim.

It is necessary for the proper expedition of business before the Office and in the interest of clearness that the specification should not be unnecessarily prolix and that the drawing should not include illustrations of inventions other than that covered in the claims. It is clear that the invention claimed can be described in such a manner as to satisfy the requirements of the statute without specifically describing and showing the machine which the petitioner desires to use in the manufacture of the article. Such being the case, the action of the Examiner is correct.

The petition is denied.

EX PARTE HENRY.

Decided April 16, 1902.

1. DRAWINGS—FIGURES COMPLETELY SHOWING THE ARTICLE OF MANUFACTURE CLAIMED AMPLY SUFFICIENT.

It is not necessary to retain in the drawing of an application for a patent on an article a figure to illustrate a process or step in its manufacture when the completed article defined in the claim is clearly shown in another figure and the disclosure is amply sufficient to enable any one skilled in the art to make and construct the same.

2. AMENDMENT—NEW MATTER AFFECTING CLAIM—QUESTION RELATES TO MERITS—APPEAL IN FIRST INSTANCE TO EXAMINER-IN-CHIEF.

Where in the answer to a petition brought on another point the Examiner calls attention to a certain amendment made to the specification and states that if retained in the case he will be compelled to reject the claim which now stands allowed, as

in his opinion the alleged new matter affects the claim, *Held* that as this question relates to the merits of the case and is therefore appealable in the first instance to the Examiner-in-Chief no opinion in regard to it is expressed.

ON petition.

CHECKERING.

Application of Curtis B. Henry filed June 10, 1901, No. 64,089.

Messrs. W. T. Fitz Gerald & Co. for applicant.

ALLEN, Commissioner:

This is a petition from the action of the Examiner requiring the cancellation from the drawings of original Figure 2.

The records show that the drawings as originally filed contained four figures.

In the specification as originally filed these figures were briefly described as follows:

Fig. 1 is a perspective view showing my invention as applied to use upon an ordinary bridle or harness. Fig. 2 is a detail in perspective illustrating the device separated from the checkrein proper. Fig. 3 shows a modified construction thereof. Fig. 4 illustrates another form of my invention ready for use.

The invention relates to a bifurcated elastic attachment for checkreins.

The form shown in Fig. 4 differs from that shown in Fig. 3 in placing anchoring means on each side of the elastic strap, so arranged as to limit the stretch of the elastic strap and to also act as a safety-catch in case the strap should break. Everything shown in Fig. 3 is included in original Fig. 4.

After several actions a claim was allowed which covers specifically the construction shown in original Fig. 4.

The Examiner is of the opinion that the state of the art prevents the allowance of a claim broad enough to cover both constructions shown in the two figures. The petitioner was required before the application could be passed to issue to cancel Figs. 3 and 4 and the description relating thereto. The petitioner responded by canceling Fig. 3 and requesting the numeral of original Fig. 4 to be changed to read 3. An amendment was also filed canceling the brief description of the figures and inserting the following:

Fig. 1 is a perspective view of my invention as applied to use. Fig. 2 is a detail in perspective illustrating my device partly finished. Fig. 3 illustrates my invention complete ready for use.

It is stated in a paper filed February 1, 1902, that—

“ . . . applicant's desire in retaining Fig. 2 of the drawings is to illustrate a process or step in the manufacture of his invention.”

It is not necessary to retain in the drawing of an application for a patent on an article a figure to illustrate a process or step in its manufacture. The completed article defined in the claim is clearly shown in present Fig. 3, (original 4.) The illustration is amply sufficient to enable any one skilled in the art to make and construct the same.

The form shown in Fig. 2 was originally described as not only a completed form, but as the preferred form. To now describe it as an incomplete device is inconsistent, to say the least. The Examiner's action requiring the cancellation of Fig. 2 from the drawings and the brief description thereof from the specification is clearly correct.

The Examiner has called attention to the fact that he has informed the petitioner that a certain

[Vol. 99, No. 5.]

amendment to the specification, filed January 11, 1901, contains new matter, and in the event that the petitioner insists on the said amendment he will be compelled to reject the claim which now stands allowed, as in his opinion the alleged new matter affects said claim. As this question relates to the merits of the case and is therefore appealable in the first instance to the Examiner-in-Chief, no opinion in regard to it is now expressed.

The petition is denied.

DECISIONS OF THE U. S. COURTS

Court of Appeals of the District of Columbia.

SILVERMAN v. HENDRICKSON.

Decided March 5, 1902.

1. INTERFERENCE—PRIORITY—DILIGENCE.

Prior conception without prior reduction to practice will not avail unless there has been diligence in the elaboration of the idea looking toward reduction to practice.

2. SAME—CONSTRUCTIVE REDUCTION TO PRACTICE—SUBSTITUTE APPLICATION.

Where H. filed an application for a patent on the invention in controversy on June 9, 1897, and at a later date filed the application here involved as a substitute for that earlier one, *Held* that he is under the well-settled rule entitled to June 9, 1897, for a constructive reduction to practice.

3. SAME—EVIDENCE.

The allegation on behalf of S. that he reduced the invention to practice in the summer of 1897 does not show that he reduced it to practice before June 9.

4. SAME—UNSATISFACTORY EVIDENCE—DISCREDITING CIRCUMSTANCES.

Where the evidence is very unsatisfactory and uncertain, but shows S. to have been active in experimentation on the general lines of this invention in February, 1897, but he then filed an abortive application disclosing this invention and does not allege reduction to practice until the summer of 1897, *Held* that he has not satisfactorily shown conception in February.

Messrs. Church & Church for the appellant.

Messrs. Foster & Freeman for the appellee.

MORRIS, J.:

This is an appeal from a decision of the Commissioner of Patents in an interference case, where in the subject of controversy between the parties is the question of priority of invention of—

a composition consisting of the light cellular substance separated out from the fibers in cornstalk-pith, the same being charged with oil.

This composition the appellant Silverman in his preliminary statement claims to have conceived and explained to others “during the early part of the year 1897,” and he alleges that he made samples embodying the invention “during the summer of 1897,” “and that during the fall of 1897, he used the said invention in the city of Milwaukee, and elsewhere, and has since continued to use the same in various parts of the United States.” These several dates, which are somewhat indefinite, he seeks in his testimony to make more specific.

The appellee Hendrickson alleges in his preliminary statement that he conceived the invention and disclosed it to others about January 1, 1897; that he made no drawing or model of it, but tested the invention about March 1, 1897; that he filed an

[Vol. 99,

application in the Patent Office for the subject-matter of this invention on June 9, 1897; that the application involved in this interference, which he claims to be a substitute for and continuation of the original application, was filed on August 30, 1897; and—

that he personally never reduced the invention to practice, but that he understands it has been reduced to practice by others interested in said invention, but as to the exact date of such reduction to practice he is not advised.

This alleged reduction to practice appears in the testimony to have been made by employees of the Marden Company of Philadelphia, to which Hendrickson appears to have assigned his rights in the invention.

Silverman's application for a patent bears the date of December 4, 1897, while that of Hendrickson reached the Patent Office on August 30, 1897, and his original application, if it is to be regarded, was filed on June 9, 1897.

The Examiner of Interferences held in favor of the appellant Silverman, the Board of Examiners-in-Chief and the Commissioner of Patents in favor of the appellee Hendrickson. And from the decision of the Commissioner awarding judgment of priority of invention to the latter the present appeal to this court has been prosecuted.

The testimony in this case on both sides is remarkably indefinite and unsatisfactory; but for that very reason, if for no other, we are not disposed to disturb the conclusion reached in it by the Commissioner of Patents. Without analyzing the testimony, which has been sufficiently done by the several tribunals of the Patent Office, we find two or three unquestionable facts and circumstances upon which we can dispose of the case.

The appellee Hendrickson, on June 9, 1897, filed his original application in the case, for which the application now in interference is only a substitute. This original application disclosed the invention in controversy, and must be regarded, according to the usual rule, as a constructive reduction of it to practice. That there never was actual reduction of it to practice by Hendrickson is conceded by him and distinctly stated in his preliminary statement. Nor does it distinctly appear when afterward, if at all, it was actually reduced to practice by his assignee, the Marden Company. This, however, is of no consequence in the present case, since he is entitled to constructive reduction to practice as of the date of June 9, 1897.

Now, the appellant Silverman does not claim in his preliminary statement, and in our opinion does not show in his testimony, anything that can be construed as reduction to practice until, to use his own expression, “during the summer of 1897.” The summer, according to the common understanding, includes the months of June, July and August; and we fail to find anything whatever in the record to show that the appellant effected any reduction of the invention to practice between the first and ninth of June of 1897. This would seem to be decisive of the controversy without any reference to the matter of the time of conception of the idea by either party. For, as we have repeat-

ed, as we have repeat-

edly held, it is the fact of reduction to practice, actual or constructive, or the exercise of due diligence to reach that result, that must determine the right of the inventor; and prior conception, without reduction to practice, unless there has been diligence in the elaboration of the idea looking toward reduction to practice, will not avail. (*Soley v. Hebbard*, 5 D. C. App., 90; *Porter v. Loudon*, 7 App. D. C., 64; *Arnold v. Tyler*, 10 App. D. C., 175; *Carty v. Kellogg*, 7 D. C. App., 549; *Marcel v. Decker*, 13 D. C. App., 562; *Platt v. Shipley*, 11 D. C. App., 574.)

But both the Commissioner of Patents and the Board of Examiners-in-Chief held that Hendrickson was not only the first to reduce the invention to practice constructively by the filing of his application, but that he was likewise the first to have an adequate conception of the invention, which the testimony on his behalf would tend to show occurred as early as January of 1897, while Silverman's conception of it claims no earlier date than the latter part of February, 1897.

It is very true that Silverman seems to have been very active during the months of February and March of 1897 in the way of experimentation. But we fail to see that there was in this any adequate reduction of the invention to practice. With full knowledge of what he was then doing and seeking to do, and with the fact of his experiments fresh in his memory, he filed an abortive application on February 19, which does not disclose the subject-matter of the present interference, and which, it would seem, should have disclosed it, if he had it. It covered broadly a claim for defibred pith of cornstalk to be used for any purpose; and it has no reference to any composition of cornstalk and oil. The claim very plainly was for what was already being done by the Marsden Company under the Marsden patent; and Silverman candidly admits that he was only seeking to do in a better way what the Marsden people had been doing for some time. His efforts seem to have been how best to segregate the pith from the woody fiber which passes through it, and not to effect any composition of the pith with oleaginous material for lubrication or any other purpose. It is inconceivable that, if he then had reduced to practice the invention in controversy, he should, in his application filed on December 4, 1897, have assigned his reduction to practice to the summer of that same year. There would seem to have been but little difference between what he did and the perfected invention; but he must be bound by the limitations which he himself prescribes for his reduction to practice.

The decision of the Commissioner awarding judgment of priority of invention to the appellee Hendrickson, is affirmed.

The clerk of the court will certify this opinion and the proceedings in this cause in this court to the Commissioner of Patents according to law.

Court of Appeals of the District of Columbia.
LOOMIS v. HAUSER.

Decided March 5, 1902.

1. INTERFERENCE—REDUCTION TO PRACTICE—SIMPLE DEVICE—ILLUSTRATIVE MODEL AND PERFECTED DEVICE.

The ticket-holder in controversy is an exceedingly simple invention consisting mainly in the folding of a small piece of paper, and there can scarcely be any practical difference between what is designated as an illustrative model and the perfected device. Held, therefore, that the making of such a holder by Hauser was a reduction to practice.

[Vol. 99.

2. SAME—SAME—SAME—MORE CONSTRUCTION SUFFICIENT.

Some devices are so simple and their purpose and efficiency so obvious that the complete construction of one of a size and form intended for and capable of practical use may well be regarded as a sufficient reduction to practice without actual use or test in an effort to demonstrate their complete success or probable commercial value. (Citing *Mason v. Hepburn*.)

3. SAME—SAME—LINDEMEYER v. HOFFMAN DISTINGUISHED.

This case distinguished from *Lindemeyer v. Hoffman*, (95 O. G., 888,) wherein the inventor expressly admitted that his device was not fit for practical use.

Mr. R. W. Bishop for the appellant.

Mr. W. A. Redmond for the appellee.

MORRIS, J.:

This is an appeal from the Commissioner of Patents in a case of interference between the appellee George Hauser, who holds a patent for the invention in controversy issued to him on June 19, 1900, and the appellant Eugene O. Loomis, who filed an application on July 6, 1900, for a patent for the same invention.

The invention in question is an improvement in holders for theater and transportation tickets, which is described in two several counts taken from the two several claims of the appellee Hauser's patent, as follows:

1. A ticket-holder consisting of a blank having a flap at one corner thereof adapted to be folded but once over on to and pasted along merely two of its marginal edges to said blank to form an open-ended pocket and said blank being folded on itself, so as to leave the pocket-opening uncovered, to a rectangular shape corresponding to the pocket.
2. A ticket-holder consisting of a blank having a flap at one corner thereof adapted to be folded but once over on to said blank and pasted thereto along merely two of its marginal edges to form an open-ended pocket, and said blank containing spaces for theater diagrams, programs, and advertising matter, and foldable to a rectangular shape corresponding to the pocket.

As already stated, the appellee Hauser holds a patent for the invention, which was issued to him on June 19, 1900, in pursuance of an application filed on April 23, 1900. The appellee Loomis did not file his application until July 6, 1900; and the claims of the patent to Hauser were copied into it for the purpose of procuring the declaration of interference now before us. There is contained in the record a previous application of the appellant Loomis, filed on November 21, 1898, for a patent for a somewhat similar invention, and the proceedings thereon which, on October 12, 1899, resulted in its rejection, in which action the applicant seems to have acquiesced, and to have proceeded no further. In the brief filed in this court on behalf of the appellant it is alleged that, in an amendment to the appellant's specifications in these previous proceedings, the invention in controversy, or something very much like it, is distinctly disclosed. But in the opinions of the several tribunals of the Patent Office there seems to have been no notice taken of this alleged previous disclosure, or of the proceedings upon the appellant's first application. Nor was it necessary perhaps to notice them, inasmuch as all the steps of invention claimed in the present case had been taken by Loomis from July to November of 1898, both inclusive.

In his preliminary statement filed in the present interference Hauser, the appellee, alleged conception of the invention by him and a drawing illustrative of it in May of 1897, and a disclosure of it and reduction to practice in September of 1897.

No. 5.]

The appellant Loomis, in his preliminary statement, alleged conception, disclosure and the making of a model of the invention in July of 1898, and the execution of a drawing and reduction to practice in November of 1898. After testimony taken by both parties tending to support their respective statements, the Examiner of Interferences rendered judgment of priority in favor of the patentee Hauser. This judgment the Board of Examiners-in-Chief reversed; but the Assistant Commissioner, who acted in the place of the Commissioner, reversed the judgment of the Board, sustained the Primary Examiner, and awarded judgment of priority of invention to Hauser. From his decision appeal has been taken to this court by the applicant Loomis.

There seems to be no great contrariety of evidence in the case; and it would appear that both parties are in fact independent inventors, without knowledge on the part of either that the other was in the field. The testimony on behalf of each litigant fairly tends to support his preliminary statement as to what he did; and it shows conclusively that Hauser had a conception of the invention in the year 1897, while the conception of Loomis was of the year 1898. All the tribunals of the Patent Office concur in holding that the patentee Hauser was the first to conceive. They differ only in the fact that the Board of Examiners hold that he was not the first to reduce the invention to practice, and that he was not in the exercise of due diligence when Loomis entered the field of invention, while the Examiner of Interferences and the Commissioner, upon appeal from the Board, held that what Hauser did in 1897 was a reduction to practice, in consequence of which there was no occasion to raise or to decide the question of diligence as between the parties.

It is not seriously, if at all, controverted by the appellant in this court that the appellee was the first to conceive the invention; and we fully concur in the decisions of the Patent Office which unanimously awarded priority to him in that regard. The substantial question between the parties is, whether what the appellee did in the year 1897, before the advent of the appellant in the field of invention, was a reduction to practice.

It is shown that, in September of 1897, the appellee made, or caused to be made, a full-sized ticket-holder, embodying the construction of the device now in issue—in fact, that a couple of dozen of such ticket-holders were made about that time, and were used for one purpose or another by the appellee. And this showing is not sought to be controverted. Now, the invention is an exceedingly simple one, consisting mainly in the folding of a small piece of paper; and there can scarcely be any practical difference between what is designated as an illustrative model and the perfected device. What was said by this court in the case of *Mason v. Hepburn* (18 D. C. App., 86; 84 O. G., 147) is entirely applicable to this invention. There it was said:

Some devices are so simple and their purpose and efficiency so obvious that the complete construction of one of a size and form

[Vol. 99.

intended for and capable of practical use might well be regarded as a sufficient reduction to practice without actual use or test in an effort to demonstrate their complete success or probable commercial value.

The Board of Examiners-in-Chief, as we think, were led into error by their construction of the case of *Lindemeyer v. Hoffman*, (18 D. C. App., 1; 95 O. G., 888,) which they regarded as determining the same precise point as is here involved. In that case a solitary cap or stopper for bottles was offered in evidence as a reduction to practice; but the designer of it distinctly admitted that this cap itself was not fit for practical use. Necessarily, therefore, it was not a reduction to practice. But in the case before us, it is shown that specimens of ticket-holders actually made were fit for practical use, and were in fact used.

We think that this case is governed by the ruling in the case of *Mason v. Hepburn*, and that there was actual reduction of the invention to practice by the appellee in September of 1897. And in view of this conclusion it is wholly unnecessary to consider the question of diligence on the part of either or both parties.

It may be proper to notice that the testimony of the appellant taken in rebuttal is directed to impugn the credibility of the appellee in reference to statements which he had made implying that he had a patent before his patent had actually been issued. But these statements are easily explainable without impugning of the appellee's veracity. He had made his application for a patent, had probably been informed that the application had been allowed and the patent would be issued; and it was not unnatural that he should regard his rights as thereby protected from infringement.

It follows from what we have said that the decision of the Commissioner of Patents must be affirmed; and that judgment of priority of invention must be awarded to the appellee George Hauser.

The clerk of the court will certify this opinion, and the proceedings in the case in this court, to the Commissioner of Patents, according to law.

DECISION OF SECRETARY OF THE INTERIOR.

IN RE MACONOCHE SOLDERLESS TINNING COMPANY, LIMITED.

1. APPEAL TO THE SECRETARY—JUDICIAL QUESTION—CERTIFICATE OF CORRECTION OF PATENT.

An appeal to the Secretary of the Interior from the decision of the Commissioner of Patents refusing to indorse a certificate of correction upon a patent because of an alleged mistake by the Patent Office dismissed for the reason that the decision was a judicial determination by the Commissioner.

2. SAME—SAME—SAME.

The question whether a certificate of correction shall be indorsed upon a release patent imposes the duty of deciding in the first place whether the release was improperly granted and if so in what the error consists. These are judicial questions not subject to superintendence and direction by the Secretary of the Interior.

DEPARTMENT OF THE INTERIOR,
Washington, April 15, 1902.

SIR: The appeal of the Maconochie Solderless Tinning Company, Limited, through its attorney, No. 5.]

Philip Mauro, Esq., from your decision of January 23, 1902, refusing to correct an alleged error in the grant of Reissued Letters Patent No. 11,935, "Tins for Inclosing Preserved Provisions or Foods and the Like," is dismissed, for the reason that the question involved therein is one which has been judicially determined by the Commissioner of Patents, and in such cases the Secretary of the Interior has no appellate jurisdiction.

I transmit herewith for your information a copy of an opinion of the Assistant Attorney-General of this Department upon the question presented in the appeal above mentioned.

Very respectfully,

E. A. HITCHCOCK,
Secretary.

The Commissioner of Patents.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE ASSISTANT ATTORNEY-GENERAL,
Washington, April 12, 1902.

SIR: By reference of the 3d instant I am asked for an opinion upon the questions presented by the appeal of the Maconochie Solderless Tinning Company, Limited, from the action of the Commissioner of Patents of January 23, 1902, denying the petition of said company asking the correction of an alleged error in the grant of Reissued Letters Patent No. 11,935.

It appears that on August 7, 1900, Letters Patent of the United States, No. 655,448, were issued to Maconochie Brothers in accordance with an assignment of the invention to them by Archibald W. Maconochie, the inventor, dated July 23, 1899, and recorded in the Patent Office August 5, 1899; that on July 11, 1901, an application for reissue of said patent was executed at London, England, by A. W. Maconochie, the written assent of the assignees, Maconochie Brothers, being indorsed on said application, such assignees being at that time the owners of the entire interest in the original patent and invention; that this application was filed in the United States Patent Office at Washington July 23, 1901, accompanied by a certified abstract of the title of the original patent as it appeared of record in the Patent Office at that date and as it actually existed at the date of execution of the reissue application; that in the meantime and on July 18, 1901, while the reissue application was en route to the United States and four days before it was filed in the Patent Office, Maconochie Brothers executed at London an assignment transferring the entire interest in the original patent and invention to the Maconochie Solderless Tinning Company, which assignment was recorded in the Patent Office July 31, 1901; that the reissue application was duly allowed in accordance with the request contained in the application; that after the reissue was granted it was brought to the attention of the Patent Office by a request for correction; that the invention and patent had been assigned to the Maconochie Solderless Tinning Company, Limited, and that the assignment had been recorded in that Office before the grant of the reissue, and it was contended that the reissue patent should have been

granted to the company instead of to Maconochie Brothers.

In denying the petition for correction the Commissioner of Patents says:

The patent was issued in accordance with the request contained in the petition, and upon the record of that application it could not have been issued to any one else than Maconochie Bros. The patent as issued conforms to the record of the application, and therefore there is no foundation in the case for the certification of correction requested. It is true that the patent might properly have been issued to the subsequent assignee, The Maconochie Solderless Tinning Syndicate, Limited, upon proper intervention by it, but in the absence of such intervention, the patent could not properly have been granted to it.

It is contended by the appellant that inasmuch as there was at the time of the reissue on file in the Patent Office evidence of the assignment of the entire interest in said patent from Maconochie Brothers to the Maconochie Solderless Tinning Company, Limited, the reissue should have been in the name of the company in accordance with the well-established practice of that Office; that it was error in view of the record made in the reissue application to make the reissue in the name of Maconochie Brothers; that this error should be corrected in accordance with the provisions of the first paragraph of Rule 170 of the Rules of Practice of the Patent Office, and that the Commissioner of Patents refusing to make such correction the matter is one within the cognizance of the Secretary of the Interior.

The Commissioner of Patents admits that if the fact of the assignment to the company had not been overlooked the reissue would not have been allowed without the company's assent, but contends that the reissue could not on the record before the Patent Office have been legally made to the company; that the error is not one within Rule 170; that if there have been instances in which the Patent Office has made reissues to assignees in the absence of "proper intervention" by such assignees such reissues were not in conformity with law and will not be recognized as precedents, and finally that in any event the Commissioner's action in the premises is judicial and not subject to review by the Secretary of the Interior.

Paragraph 1 of said Rule 170 is as follows:

Whenever a mistake, incurred through the fault of the Office, is clearly disclosed by the records or files of the Office, a certificate, stating the fact and nature of such mistake, signed by the Secretary of the Interior, countersigned by the Commissioner of Patents, and sealed with the seal of the Patent Office, will, at the request of the patentee or his assignee, be indorsed without charge upon the Letters Patent, and recorded in the records of patents, and a printed copy thereof attached to each printed copy of the specification and drawing.

The determination under this rule of the question whether a certificate of correction as therein provided for should be issued under the facts hereinbefore stated of necessity imposes the duty of deciding in the first place whether the reissue was improperly made, and if improperly made the further duty of deciding in what the error consists. I am of opinion that these are judicial questions and as such not subject to the power of superintendence and direction conferred upon the Secretary of the Interior by section 441 of the Revised Statutes. (See *Butterworth v. Hoe*, 112 U. S. 30; also, my opinion of February 20, 1899, in the case of *Pool v. Avery*, 14 Assistant Attorney-General's Opinions, 177.)

I advise that the Secretary of the Interior is without jurisdiction or authority over the matter presented by this appeal.

Very respectfully,

WILLIS VAN DEVANTER,
Assistant Attorney-General.
The Secretary of the Interior.
Approved April 12, 1902.
E. A. HITCHCOCK,
Secretary.

Revision of Trade-Mark Rules.

(ORDER NO. 1,405.)

DEPARTMENT OF THE INTERIOR.

UNITED STATES PATENT OFFICE.

Washington, D. C., April 2, 1902.

Rule 21, subdivision (b.) governing the registration of trade marks, is hereby amended to read as follows:

(b) A statement specifying name, domicile, location, and citizenship of the party applying; the class of merchandise and the particular description of goods comprised in such class to which the particular trade-mark has been appropriated; a description of the trade-mark itself, and a statement of the mode in which the same is applied and affixed to goods, and the length of time during which the trade-mark has been used, and if the applicant be a corporation it must set forth under the laws of what State or nation incorporated.

F. I. ALLEN,
Commissioner.

Amendment of Section 4893, Revised Statutes, Relating to the Signing of Letters Patent.

DEPARTMENT OF THE INTERIOR.

UNITED STATES PATENT OFFICE.

Washington, D. C., April 22, 1902.

By the act approved April 11, 1902, section 4893, Revised Statutes, has been amended to read as follows:

SEC. 4893. All patents shall be issued in the name of the United States of America, under the seal of the Patent Office, and shall be signed by the Commissioner of Patents, and they shall be recorded, together with the specifications, in the Patent Office in books to be kept for that purpose.

F. I. ALLEN,
Commissioner.

Amendments to Allowed Applications.

Hereafter all amendments proposed to allowed applications and all petitions and requests relating thereto shall be filed with the docket clerk, Mr. J. M. Emory, and transmitted by him to the Primary Examiner for report. If the Examiner shall report favorably to the admission of such amendment, the matter will be laid before the Commissioner for immediate determination. If the Examiner shall report unfavorably, the case will be docketed and will be heard and decided by the Commissioner in regular course, unless good reasons shall appear for immediate action. (Order 669 amended October 15, 1900.)

Renewal of Forfeited Applications.

Attention is called to section 4, 387, Revised Statutes, relating to the renewal of allowed applications forfeited through failure to pay the final fee within six months from the date of allowance. The law requires the petition for renewal to be signed by the inventor, discoverer, or assignee and that the same be filed in this Office within two years after the allowance of the original application. If the inventor be dead, the petition must be signed by the administrator or executor; if insane, by the guardian, conservator, or legal representative. It will not be accepted if signed by the attorney. (Form 12, page 64, Rules of Practice, should be used.)

PATENTS

GRANTED MAY 6, 1902.

699,126. CLASP. GEORGE R. ADAMS, INVENTOR, E. J. FINE, REV. 26, 1901. Serial No. 55,972. (No model.)

Claim.—1. In a clasp, a body comprising a pair of doubled-over members or plates, one of the members of said body being made with an opening, a flange having an opening and arranged over said member of said body, and a clamping or holding lever pivotedly connected with said flange, said lever comprising a clamping-arm, said arm normally being seated in the opening of said flange, but when said lever is operated, said clamping-arm being arranged across the space between the mid members of said body, substantially as and for the purposes set forth.

2. In a clasp, a body comprising a pair of doubled-over members or plates, one of said members of said body being made with an opening, a flange having an opening and arranged over said member of said body, a clamping or holding lever pivotedly connected with said flange, said lever comprising a clamping-arm, said arm normally being seated in the opening of said flange, but when said lever is operated, said clamping-arm being arranged across the space between the mid members of said body, and a spring arranged between the mid members of said body, said spring comprising a pair of members or limbs against one of which the end of the clamping-arm of said lever is brought in operative engagement when said lever is lowered, substantially as and for the purposes set forth.

3. In a clasp, a body comprising a pair of doubled-over members or plates, one of said members of said body being made with an opening, a flange having an opening and arranged over said member of said body, a clamping or holding lever pivotedly connected with said flange, said lever comprising a clamping-arm, said arm normally being seated in the opening of said flange, but when said lever is operated, said clamping-arm being arranged across the space between the mid members of said body, and a spring arranged between the mid members of said body, said spring comprising a pair of doubled-over members or limbs, and a rib on the upper member or limb of said spring with which the end of the clamping-arm of said lever is brought in operative engagement when said lever is lowered, substantially as and for the purposes set forth.

4. In a clasp, a body comprising a pair of doubled-over members or plates, one of the members of said body being made with an opening, a flange having an opening and arranged over said member of said body, and a clamping or holding lever pivotedly connected with said flange, said lever comprising a clamping-arm, said arm normally being seated in the opening of said flange, but when said lever is operated, said clamping-arm being arranged across the space between said members of said body, and the free end of the clamping-arm of said lever having a notch for receiving and a spring arranged between the mid members of said body, said spring comprising a pair of doubled-over members or limbs, and a guiding-rib on the upper member or limb of said spring over which the notched or recessed end of the clamping-arm of said lever is seated, when the said lever is turned down, substantially as and for the purposes set forth.

5. In a clasp, a substantially U-shaped body having a member thereof provided with an elongated slot, and another member thereof provided with an inwardly-projecting lug, a flange also provided with a slot arranged over the slotted member of said body, combined with a lever pivotedly connected with the said flange and said slotted member of the said body, a U-shaped spring arranged between the members of said body, one member of said spring being provided with a guiding-rib, and the other member of said spring having a perforation in which said lug of said body is adapted to be seated, and a clamping-arm on said lever having a notch or recess in its end adapted to be seated over said rib when said lever is closed down, and said clamping-arm of said lever being adapted to be seated in the slotted portions of said body portion and said flange, when the lever is raised, substantially as and for the purposes set forth.

6. In a clasp, the combination, with a substantially U-shaped body, one of the members thereof having a slot, and a flange on said U-shaped body having an internal marginal edge by means of which said flange is secured to said body, of a pivotedly-arranged lever, and a substantially U-shaped spring arranged between the members comprising said body, one of the members of said spring being held in a fixed position to one of the members of said body, and the other member of said spring being movable but normally lying back of the internal marginal edge of the flange and in close contact with the under surface of the slotted member of said body, for preventing the free end portion of said spring from contact with the material while being inserted between the members of the spring, and the free end of the movable member of said spring being adapted to be forced below the internal marginal edge of said flange when the lever is manipulated for grasping the inserted material, substantially as and for the purposes set forth.

7. In a clasp, the combination, with a substantially U-shaped body, one of the members thereof having a slot, and a flange on said U-shaped body having an internal marginal edge by means of which said flange is secured to said body, of a pivotedly-arranged lever, and a substantially U-shaped spring arranged between the members comprising said body, one of the members of said spring being held in a fixed position to one of the members of said body, and the other member of said spring being movable but normally lying back of the internal marginal edge of the flange and in close contact with the under surface of the slotted member of said body, and an extension connected with the mid connected flange and body and extending away from the same for the purpose of a finger piece or the attachment thereof of other fastening means, substantially as and for the purposes set forth.

8. In a clasp, a body comprising a pair of doubled-over members or plates, one of said members of said body being made with an opening, a flange having an opening and arranged over said member of said body, and inwardly-turned clamping edges on said flange for securing said flange to said member of said body, a clamping or holding lever pivotedly connected with said flange, said lever comprising a clamping-arm, said arm in its raised position being seated in the opening in said flange, but when said lever is operated to bring said clamping-arm in its gripping position, said clamping-arm being arranged across the space between the mid members of said body, and a spring arranged between the mid members of said body, said spring comprising a pair of members or limbs against one of which the end of the clamping-arm of said lever is brought in operative engagement when said lever is lowered, substantially as and for the purposes set forth.

9. A clasp consisting of a movable frame, a spring located between the members of said frame, one of the members of said frame having an elongated slot, a guide-rib on said spring, a lever fitted to said frame having a recessed clamping-arm movably arranged in said slot and the recessed part of said clamping-arm being adapted to fit over the said rib on said spring to prevent lateral movement of the spring, and a flange secured to said frame, said flange having a slot and bearings on opposite sides of said slot, and pivotal lugs on said lever arranged in said bearings, substantially as and for the purposes set forth.

ing adapted to be seated in the slotted portions of said body portion and said flange, when the lever is raised, substantially as and for the purposes set forth.

6. In a clasp, the combination, with a substantially U-shaped body, one of the members thereof having a slot, and a flange on said U-shaped body having an internal marginal edge by means of which said flange is secured to said body, of a pivotedly-arranged lever, and a substantially U-shaped spring arranged between the members comprising said body, one of the members of said spring being held in a fixed position to one of the members of said body, and the other member of said spring being movable but normally lying back of the internal marginal edge of the flange and in close contact with the under surface of the slotted member of said body, for preventing the free end portion of said spring from contact with the material while being inserted between the members of the spring, and the free end of the movable member of said spring being adapted to be forced below the internal marginal edge of said flange when the lever is manipulated for grasping the inserted material, substantially as and for the purposes set forth.

7. In a clasp, the combination, with a substantially U-shaped body, one of the members thereof having a slot, and a flange on said U-shaped body having an internal marginal edge by means of which said flange is secured to said body, of a pivotedly-arranged lever, and a substantially U-shaped spring arranged between the members comprising said body, one of the members of said spring being held in a fixed position to one of the members of said body, and the other member of said spring being movable but normally lying back of the internal marginal edge of the flange and in close contact with the under surface of the slotted member of said body, and an extension connected with the mid connected flange and body and extending away from the same for the purpose of a finger piece or the attachment thereof of other fastening means, substantially as and for the purposes set forth.

8. In a clasp, a body comprising a pair of doubled-over members or plates, one of said members of said body being made with an opening, a flange having an opening and arranged over said member of said body, and inwardly-turned clamping edges on said flange for securing said flange to said member of said body, a clamping or holding lever pivotedly connected with said flange, said lever comprising a clamping-arm, said arm in its raised position being seated in the opening in said flange, but when said lever is operated to bring said clamping-arm in its gripping position, said clamping-arm being arranged across the space between the mid members of said body, and a spring arranged between the mid members of said body, said spring comprising a pair of members or limbs against one of which the end of the clamping-arm of said lever is brought in operative engagement when said lever is lowered, substantially as and for the purposes set forth.

9. A clasp consisting of a movable frame, a spring located between the members of said frame, one of the members of said frame having an elongated slot, a guide-rib on said spring, a lever fitted to said frame having a recessed clamping-arm movably arranged in said slot and the recessed part of said clamping-arm being adapted to fit over the said rib on said spring to prevent lateral movement of the spring, and a flange secured to said frame, said flange having a slot and bearings on opposite sides of said slot, and pivotal lugs on said lever arranged in said bearings, substantially as and for the purposes set forth.

699,127. FURNACE FOR ROLLING-MILLS. THOMAS V. ADAMS, Bridgeport, Conn. Filed Apr. 20, 1902. Serial No. 712,764. (No model.)

Claim.—1. A furnace of the character described provided with a combustion-chamber located beneath the work-supporting floor; bricks comprising the floor of said chamber constructed with pockets or recesses

opening into said combustion-chamber; an opening in one of the side walls of the pockets, and pipes communicating therewith and with a gas-supply, for the purpose set forth.

2. A furnace of the character described provided with a combustion-chamber; bricks comprising the floor of said chamber provided with pockets or recesses opening into said combustion-chamber, and having one of their side walls inclined and adapted to deflect flame projected therein and an opening into one of the side walls of the pockets and communicating with a gas-supply, as set forth.

3. A furnace of the character described provided with a combustion-chamber; bricks comprising the floor of said chamber, provided with pockets or recesses opening into said combustion-chamber, and constructed with side openings therein adapted to project flame above the bottoms of said pockets or recesses, for the purpose set forth.

4. The combination, in a furnace of the character described having a combustion-chamber, and floor-bricks thereof having pockets or recesses opening into said chamber, of a gas-receiver and a series of gas-distributing conveyors placed below said floor-bricks, and pipes connecting said conveyors with the pockets of said floor-bricks, for projecting flame into said pockets or recesses, for the purpose set forth.

699,128. METHOD OF FEEDING METAL STRIPS IN FURNACE. THOMAS V. ALLAN, Bridgeport, Conn. Filed Sept. 19, 1901. Serial No. 30,804. (No model.)

Claim.—The method of heating a line of adjacent metal strips, which consists in arranging said strips in a heating-chamber with their abutting edges rounded to prevent overriding, and then advancing said line of strips through said heating-chamber, as set forth.

699,129. METHOD OF ROLLING METAL SHEETS. THOMAS V. ALLAN, Bridgeport, Conn. Filed Feb. 1, 1901. Serial No. 45,098. (No model.)

Claim.—1. The method of producing a laminated or treated structure in metal sheets, which consists in reducing this plate to sheets by hot-rolling the plates in packs at right angles to the pack or line of the previous rolling of said plates, as set forth.

2. The method of producing a laminated or treated structure in metal sheets, which consists in reducing plates to sheets by hot-rolling the plates in packs through a series of cross-rollers, whereby the plates comprising the packs are rolled at right angles to a previous rolling in packs, as set forth.

3. The method of reducing hot metal plates to sheets, to produce a laminated or treated structure of the metal in the sheets, which consists in forming the plates into a pack, with the grain of the several plates lying in the same general direction, fastening the plates together along one of their side or edge edges, and rolling the pack across the grain of the plates, as set forth.

699,130. FURNACE FOR PROGRESSIVELY HEATING METAL PLATES OR PACKS. THOMAS V. ALLAN, Bridgeport, Conn. Filed Feb. 1, 1901. Serial No. 45,091. (No model.)

Claim.—1. A furnace for progressive metal-heating consisting of a double series of heating-chambers and a central heating and delivery chamber intermediate of said series, the several heating-chambers composing the respective series being arranged in a staggered relative position and communicating one with another through transverse and passages and each series with said central chamber substantially as set forth.

2. A furnace for progressive metal-heating composed of a double series of separable and movable heating-chambers relatively arranged in a staggered position and a central heating and delivery chamber intermediate of said series, the several heating-chambers composing the respective series communicating one with another, and each series with the central chamber, and said chambers mounted on ways for purposes of removal, substitution or repair, as set forth.

699,131. METHOD OF HOT-ROLLING METAL SHEETS IN PACKS. THOMAS V. ALLAN, Bridgeport, Conn. Filed Aug. 31, 1901. Serial No. 74,094. (No model.)

Claim.—1. The herein-described continuous method of hot-rolling metal plates in packs to sheets of commercially-accurate gages, which consists in first partially reducing the original packs in a tandem mill, and

second passing said packs directly from said mill through a single pair of auxiliary rolls a sufficient number of times to complete the reduction, as set forth.

2. The herein-described method of hot-rolling metal plates in packs to sheets of commercially-accurate gages, which consists in partially reducing the packs in a tandem mill, removing therefrom such packs as have been damaged or inefficiently rolled when intermediate of any two pairs of rolls in said mill, and passing the same through a single pair of auxiliary rolls a sufficient number of times to complete the reduction whereby a finished product of any desired gage is produced without interfering with the continuous operation of the mill, as set forth.

3. The herein-described method of hot-rolling metal plates in packs to sheets of commercially-accurate gages, which consists in, first, effecting a partial reduction in a tandem mill, and, second, passing said packs through a single pair of auxiliary rolls a sufficient number of times to complete the reduction and at a single heat, as set forth.

699,132. METHOD OF FEEDING AND HEATING METAL PLATES OR PACKS. THOMAS V. ALLAN, Bridgeport, Conn. Filed Sept. 29, 1901. Serial No. 75,095. (No model.)

Claim.—The method of progressively feeding and heating a train of metal plates or packs for reduction which consists in advancing said train in separate sections, each section containing a plurality of plates or packs, by progressively each section the distance completed by one plate or pack, and transferring a plate or pack from the forward end of each section to the rear end of the preceding section, and augmenting the degree of heat in said packs or plates during their period of transit, as set forth.

699,133. CONVEYER AND GUIDE FOR ROLLING-MILLS. THOMAS V. ALLAN, Bridgeport, Conn. Filed Oct. 4, 1901. Serial No. 77,096. (No model.)

Claim.—1. A conveyer for metal plates or packs consisting of two endless chains cooperating on a horizontal plane and composed of wide and narrow links, the wide links adapted to support the ends of the plates or packs, and the narrow links adapted to act as side guides, for the purpose set forth.

2. A metal-conveyer, consisting of two endless chains operating in unison on a horizontal plane and at the same linear speed and composed of wide and narrow links adapted to both support and guide the metal in transit, for the purpose set forth.

3. A conveyer for metal plates or packs, consisting of two series or systems of endless chains arranged parallel with each other and operated on a horizontal plane and at the same linear speed so as to squarely guide the metal in transit, for the purpose set forth.

4. A conveyer for metal plates or packs, consisting of two series or systems of endless chains arranged parallel with each other on a horizontal plane and to cooperate at the same linear speed, the chains adapted to both support and squarely guide the metal in transit, combined with

means whereby the path of feeding of the metal may be adjusted for different widths of plates or packs, for the purpose set forth.

5. A conveyer for metal plates or packs, consisting of a double series of endless chains arranged parallel with each other and adapted to cooperate at the same linear speed, the chains adapted to both support and squarely guide the metal in transit, combined with means for adjusting the width of the feedway and means for propelling and tightening said chains, substantially as described, for the purpose set forth.

6. A conveyer for metal plates or packs, consisting of a double series of endless chains arranged parallel with each other and adapted to cooperate at the same linear speed, the chains adapted to both support and squarely guide the metal in transit, combined with means for regulating the width of said conveyer, and means for automatically adjusting and maintaining a parallel movement with varying widths of plates or packs, for the purpose set forth.

699,134. ASH-SHUTTER. HENRY H. ASHLEY, Baltimore Falls, Vt. Filed Sept. 12, 1901. Serial No. 78,097. (No model.)

Claim.—In combination, the casing having inlet-opening, the double-binged doors to said inlet-opening, the single weights for automatically closing both doors, and the intermediate chain, lever, link and crank-arms, all substantially as described and for the purpose set forth.

699,135. CHAIR FOR MINING-GAS. JOHN C. BARNES, St. Louis, Mo. Filed May 4, 1901. Serial No. 80,798. (No model.)

Claim.—1. In an apparatus of the class described, the combination of dog-carrying means, dogs swingingly connected to said means, means whereby pressure medium is applied to elevate said dog-carrying means, and means whereby said dogs are moved from downwardly-inclined positions to horizontal positions, substantially as described.

2. In an apparatus of the class described, the combination of dog-carrying means, dogs swingingly connected to said means, means whereby pressure medium is applied to elevate said dog-carrying means, and means whereby said dogs are moved from horizontal positions to downwardly-inclined positions, substantially as described.

3. In an apparatus of the class described, the combination of vertically-movable dog-carrying means, means for moving said dog-carrying means vertically, carious supported by said dog-carrying means, and dogs swingingly mounted on said carious, substantially as described.

4. In an apparatus of the class described, the combination of a pair of vertically-movable housings, a pair of dogs pivoted to said housings, means whereby said housings are elevated, and means whereby said dogs are swung on their pivots, substantially as described.

5. In an apparatus of the class described, the combination of a pair of housings, a pair of dogs pivotally connected to said housings, means whereby pressure medium is applied to elevate said housings, and independent means whereby said dogs are rocked on their pivots to raise and lower them, substantially as described.

6. In an apparatus of the class described, the combination of a pair of housings, a pair of carriers pivoted to said housings, dogs mounted on said carriers, a pair of segments carried by said housings and having link connection with said dog-carriers, and means whereby said segments are rocked to raise and lower said dog-carriers, substantially as described.

7. In an apparatus of the class described, the combination of a pair of vertically-movable housings, means for moving said housings vertically, guide-bars arranged to direct the travel of said housings, dogs carried by said housings, and means for raising and lowering said dogs, substantially as described.

8. In an apparatus of the class described, the combination of a pair of housings, means for raising and lowering said housings, a pair of carriers pivoted to said housings, dogs mounted on said carriers, segments mounted in said housings and provided with link connection to said dog-carriers, rock-bars arranged in engagement with said segments, and means for yieldingly holding said rock-bars, substantially as described.

9. In an apparatus of the class described, the combination of a pair of vertically-movable housings, means for elevating said housings, a pair of dogs, carriers connected to said housings and on which said dogs are mounted, segments rockingly mounted in said housings and having link connection with said dog-carriers, rock-bars arranged in engagement with said segments, vertically-movable rods to which said rock-bars are connected, weights slidably mounted on said rods, and yokes in which said weights are arranged to travel, substantially as described.

10. In an apparatus of the class described, the combination of dog-supporting means, dogs slidably supported by said means, and a vertically-movable suspended yoke whereby said dog-supporting means may be suspended, substantially as described.

11. In an apparatus of the class described, the combination of dog-supporting means, dogs slidably supported by said supporting means, a yoke having hooks at its upper ends and whereby said dog-supporting means may be suspended, and means for moving said hooked ends of the yoke outwardly, substantially as and for the purpose set forth.

12. In an apparatus of the class described, the combination of dog-supporting means, dogs slidably supported by said supporting means, a yoke whereby said dog-supporting means may be suspended, and a re-

tractable rod having right and left hand screw-threaded ends arranged in the arms of said yoke whereby said arms may be moved outwardly, substantially as and for the purpose set forth.

13. In an apparatus of the class described, the combination of independent dog-supporting means, dogs carried thereby, means for raising and lowering said dog-supporting means, and means whereby said dog-supporting means are caused to travel vertically in unison with each other, substantially as described.

14. In an apparatus of the class described, the combination of dog-supporting means, dogs carried thereby, pressure-receiving cylinders, piston-rods connected to said dog-supporting means and extending through said cylinders, pistons of said rods, rocks carried by said piston-rods at their lower ends, spur-wheels arranged in engagement with said rocks on a pair of shafts by which said spur-wheels are carried, and a third shaft geared to the two first-named shafts, substantially as and for the purpose set forth.

699,186. SECTIONAL HOT-WATER BOILER. RUDOLF F. BUEHNER, Dresden, Germany, assignor to Fliem & Gerlach, Schöneberg, near Berlin, Germany. Filed Jan. 14, 1901. Serial No. 43,144. (No model.)

Claim.—1. A sectional hot-water boiler provided with vertical heating-flues formed by the abutting water-chambers, secondary vertical air-supply channels also formed by the abutting water-chambers which chambers are partly or entirely heated by the combustion-gases and communicate with the heating-flues in such a manner that fresh heated air is supplied to the flues in separate jets adjacent to the point where the gases leave the furnace, substantially as described.

2. A sectional hot-water boiler provided with vertical heating-flues and with channels for a secondary air-supply, such flues and channels being formed by the abutment of the sectional water-chambers, substantially as described.

3. A water-boiler composed of abutting sections joined together at the central top and bottom portions to form a boiler, each of which sections is of such form in cross-section as with the abutting section on either side to leave between them on the inner side a vertical flue or passage for the products of combustion located within the boiler or furnace, which vertical flue is in communication at the top with a like descending flue formed in like manner, a smaller flue in communication at its top and with the first flue adjacent to its lower end being formed in like manner between the other two flues for feeding heated air to the first-named flue, substantially as shown and described.

699,187. MITTEN. FREDERICK BRETHER, Morgan Park, Ill. Filed Feb. 3, 1903. Serial No. 94,314. (No model.)

Claim.—1. In a reversing mitten the combination of two substantially similar pieces of substantially the shape which commonly form the palm of a mitten, with a gusset set between them on the edge of the mitten opposite the thumb.

2. In a reversing mitten the combination of two substantially similar pieces of substantially the shape which commonly form the palm of

a mitten, with a gusset set between them on the edge of the mitten opposite the thumb, said gusset of such width as that with either of the other portions, it forms a covering for the back and edge of the hand.

3. In a reversing mitten the combination of two pieces of substantially the same size and shape as the ordinary palm-piece of a mitten, with a thumb placed upon one edge of said two pieces where they are joined together, and a gusset interposed between them at the other edge.

4. In a mitten the combination of two pieces of substantially the same size and shape as the ordinary palm-piece of a mitten, with a thumb placed upon one edge of said two pieces where they are joined together, and a gusset interposed between them at the other edge, said thumb provided with a gusset-piece on its outer edge.

699,188. CULTIVATOR. JOHN A. BURN, Smith Center, Kans. Filed Nov. 24, 1902. Serial No. 37,045. (No model.)

Claim.—In a cultivator, the combination with the draft-beam, of a wheeled axle, diagonally-extending braces secured to the sides of the beam and to said axle and having perforated portions depending from the axle, reversibly-extending arms disposed on opposite sides of the beam and secured at their forward ends to the diagonal braces and at their rear ends to the axle and having depending perforated portions, cross-shafts mounted in the perforated depending portions of the braces and arms, an arched bar secured to the under side of the beam and having the legs thereof at their lower ends bent horizontally, braces secured to the respective sides of the beam and having their lower ends hooked about the horizontal portions of the arched bar, blocks pivotally mounted upon said horizontal

portions between the hooked ends of the braces, a gang of plows pivoted to each of said blocks to swing laterally, a pivoted strap carried by each gang embracing the cross-shafts and having rollers movable thereon, and operating-levers for swinging said cross-shafts to raise and lower the gangs of plows, substantially as described.

699,189. RAILROAD-TICKET. ALLEN I. BLANKHORN, Chicago, Ill. Filed Apr. 23, 1902. Serial No. 13,974. (No model.)

Claim.—1. The herein-described ticket book and cover, comprising the hinged cover A B, the supply of tickets detachably secured to the cover A, and the tearing edge C and gage E attached to the cover B, substantially as described.

2. The herein-described ticket book and cover, comprising the cover A B, the supply of tickets detachably secured to the cover A, and the tearing edge C and gage E secured to the cover B, the latter being of less width than the cover A and supply of tickets so that when closed upon the supply of tickets the latter will project beyond the tearing edge C, substantially as described.

3. The herein-described ticket book and cover, comprising the cover A B, the supply of tickets detachably secured to the cover A, and the sheet-metal tearing edge C secured to the cover B and having its inner edge upturned to form the gage E, substantially as described.

4. The herein-described ticket book and cover, comprising the cover A B, the supply of tickets detachably secured to the cover A, the sheet-metal tearing edge C secured to the cover B and upturned at its inner edge to form the gage E, the cover B being of less width than the supply of tickets and cover A so that when closed upon the tickets the latter will project beyond the tearing edge C, substantially as described.

699,140. ELECTRICAL ANNUATOR. CHARLES E. BARR, Brooklyn, Mass. Filed Sept. 25, 1902. Serial No. 74,045. (No model.)

Claim.—1. The combination in an annunciator, of an electromagnet, an armature, and a hermetically-sealed chamber, a colored or opaque fluid induced therein, the walls of the chamber provided with a transparent window and including a signal-target adapted to be visible when in proximity to said window and to be concealed by the said fluid when away from the window.

2. The combination in an annunciator, of an electromagnet, an armature, and a hermetically-sealed chamber, colored or opaque fluid induced therein, the walls of the chamber provided with a transparent window and including a signal-target adapted to be influenced by the electromagnet to approach and recede from the said window.

3. The combination in an annunciator, of an electromagnet, a self-retracting armature, a hermetically-sealed chamber, colored or opaque fluid induced therein, the walls of the chamber provided with a transparent window and including a signal-target, the said armature operatively connected with the signal-target.

4. The combination in an annunciator, of an iron sheath, an electromagnet, a self-retracting armature, a hermetically-sealed chamber, colored or opaque fluid induced therein, the walls of the chamber provided with a transparent window and including a signal-target, the said armature mechanically and operatively connected with the signal-target.

5. The combination in an annunciator, of an iron sheath, an electromagnet, a self-retracting armature, a hermetically-sealed chamber, colored or opaque fluid induced therein, the walls of the chamber provided with a transparent window and including a signal-target, the said armature mechanically and operatively connected with the signal-target.

6. The combination in an annunciator, of an iron sheath, an electromagnet within the said sheath, a self-retracting armature, a hermetically-sealed chamber whose walls consist of a prolongation of said sheath, colored or opaque fluid induced therein, the walls of the chamber provided with a transparent window, and a signal-target within said chamber.

7. The combination in an accumulator, of an electromagnet, an armature, a hermetically-sealed chamber, colored or opaque liquid inclosed therein, the walls of the chamber provided with a transparent window, a signal-target operated by said armature to displace the liquid from the said window and to permit the same to flow between its face and the window.

8. The combination in an accumulator of an iron sheath, an electromagnet in the said sheath, a hermetically-sealed chamber at one end of the said magnet whose walls are prolongations of the sheath, provided with a transparent window and opaque liquid inclosed therein, an armature pivoted to a target in said chamber adapted to displace the liquid between the face of the target and the window and permit the said liquid to flow between the said face and the window.

689,141. **REPAIRER.** JOSEPH BRANTHAAN and PHILIP HENNINGSEN, Brooklyn, N. Y. Filed July 3, 1901. Serial No. 67,369. (No model.)

Claim.—1. In a gas-engine, the combination with a cylinder and a piston therein, of an exhaust-valve, means for expelling the gas behind the piston, said exhaust-valve taking place at intervals less frequent than one for every cycle of piston's movement, means for opening the exhaust behind said piston to exhaust the gas after sufficient expansion thereof, an inlet-valve for the explosive mixture, a rod for operating said inlet-valve, an arm for engaging and moving said rod, a governor connected with said arm, a slide carrying the arm and governor and a cam for moving said slide, substantially as herein shown and described.

2. In a gas-engine, the combination with a cylinder and a piston therein, of an exhaust-valve, means for expelling the gas behind the piston, said exhaust-valve taking place at intervals less frequent than one for every cycle of piston's movement, means for opening the exhaust behind said piston to exhaust the gas after sufficient expansion thereof, an inlet-valve for the explosive mixture, a rod to which said valve is attached, a pivoted arm, a slide carrying said inlet and governor, a cam for actuating the slide, a rod carrying the exhaust-valve, a catch engaging said rod and means on the rod of the inlet-valve for operating said catch and a separate cam for operating the exhaust-valve, substantially as herein shown and described.

3. In a gas-engine, the combination with a cylinder and piston, of an exhaust-valve and an inlet-valve, two cams driven from the main shaft, means for actuating the inlet and exhaust valves by said cams, means for locking the exhaust-valve in open position, and means operated in connection with the inlet-valve for unlatching the exhaust-valve, substantially as herein shown and described.

689,142. **HYDRAULIC GOVERNOR FOR WATER-WHEELS.** WILLIAM J. REIDNER, PHOENIX, ARIZ., U. S. Filed Dec. 24, 1900. Serial No. 68,997. (No model.)

Claim.—1. In a water-wheel, a pressure-cylinder, a gate-shaft operatively connected with said cylinder for regulating the water-supply, a valve-cylinder communicating therewith, a longitudinally-movable valve in the valve-cylinder provided with openings to form ports and having its stem slotted longitudinally and perforated transversely of the slot, a casing secured to the stem provided with an angle-slot, a spring-pressed pin within the casing in position to enter the perforation of the stem, a pin projecting through the angular slot for moving the first-mentioned pin, and the governor provided with a perforated stem within the slot of the valve-stem and adapted to be locked against longitudinal movement therein by the spring-pressed pin.

2. In a water-wheel, a pressure-cylinder, a gate-shaft operatively connected with said cylinder for regulating the water-supply, a valve-cylinder communicating therewith, a longitudinally-movable valve-stem therein provided with openings to form ports and having its stem slotted longitudinally and perforated, a bolt through one of said perforations, a link upon each end of the bolt and extending along the slotted portion, the free end of which is provided with an outwardly-extending pin, a support on the head of the valve-cylinder, an arm pivotally secured therein, one end of which is forked and engages with the pin in the ends of the link, a governor, the stem of which fits within the slotted portion of the valve-stem, and means for detachably locking said governor-stem against longitudinal movement in the valve-stem.

689,143. **HOSE-COLLAR.** HOWN L. BROWNE, East Orange, N. J. Filed Oct. 27, 1900. Serial No. 68,981. (No model.)

Claim.—1. In a hose-collar, the combination with frame-sections pivoted together at the top and having means for separable connection at the bottom, of a single pneumatic neck having enlarged ends arranged at the sides of the collar against said sections and a reduced middle portion extending along the hinged upper ends of the sections and held therein, said reduced middle portion permitting free action of the hinged and supporting the depending end portions, and said end portions terminating short of the separable connecting means at the bottom of the collar, substantially as set forth.

2. In a hose-collar having frame-sections pivoted together at the top and separable at the bottom, a single elongated pneumatic neck extending around the upright sides and the top of the collar and being supported at its middle portion to the frame-sections at their point of hinging, the end portions of said neck depending at the sides of the collar and being adapted to cushion the said sections, said end portions terminating short of the point of separation of said sections at the bottom of the collar, substantially as set forth.

3. The improved hose-collar having a frame consisting of tubular sections, a covering inclosing said sections and secured thereto along a longitudinal line at one side, flaps, of soft cushion-like material covered partly around the frame-sections and at the side edges projecting laterally from said sections, and an elongated pneumatic neck within said covering and lying against the said cushion-like flap at the angle formed between the tubular frame-sections and covering, substantially as set forth.

4. In a pneumatic collar, the combination with the frame, and covering fastened outside of said frame, of a cushion-like flap covered partly

around said frame, the opposite edges projecting oppositely and adapted to lie in the angles formed by the frame and cover and a pneumatic neck protected at said angles by said flaps, substantially as set forth.

5. In a pneumatic collar, the combination with the frame, a covering inclosing said frame and being fastened thereto along one side, cushion-like flaps secured to the frame and adapted to enter the angles formed between the covering and frame, and a pneumatic neck, protected at said angles, when inflated, by said flaps, substantially as set forth.

6. In a pneumatic collar, the combination with the frame and covering, of a pneumatic neck within said covering and having air-tight walls, a bag within said neck whose walls permit free passage of air, and cushioning material in said bag, whereby said cushioning material may be removed from the neck in its bag and its shape retained.

7. In a pneumatic collar, the combination of hinged frame-sections, a covering for each section, a right yoke lying beneath the hinged flap, a flap at its middle portion made fast to said yoke and held away from the hinged end at its end portions lying against the adjacent ends of the sections, and a pneumatic neck protected from the hinged flap by said flap, substantially as set forth.

8. In a pneumatic collar, the combination of hinged frame-sections, a tubular covering for each section, a pneumatic neck having its end portions lying within said coverings and its middle portion extending from the inner side thereof, and flaps, of a cushion-like material, one on the outside and one on the inside thereof, substantially as set forth.

9. In a pneumatic collar, the combination of hinged frame-sections, a covering for each section, a pneumatic neck having its end portions lying within said coverings and its middle portion extending across the hinge-joint on the inner side thereof, and flaps, of a cushion-like material, one on the outside and one on the inside thereof, substantially as set forth.

10. In a hose-collar, the combination with tubular side sections threaded at their ends, of a hinge for joining the ends of said sections and comprising members cast from suitable metal and each consisting of a comparatively thin plate having at one end perforated lugs adapted to receive the hinge-pin and at the other end bosses to which the frame-sections may be secured, and a block of wood or other light substance filling the intermediate part of the hinge-leaf flush with the said bosses and lag, substantially as set forth.

11. In a hose-collar, the combination with the frame-sections, of a metal hinge, the leaves of which are turned upward at the forward side edges and provided at the ends with pivotal lugs for the hinge-pin and with bosses to which the frame-sections are secured and blocks of wood or other light substance secured upon the central parts of the upper surfaces of the leaves and lying flush at the top with the said pivotal lugs and bosses, substantially as set forth.

12. In a hose-collar, the combination with sections hinged at the top, of a catch for detachably connecting their lower ends and comprising tubular male and female members secured one to each section and adapted to enter one into the other telescopically, the male member having laterally a pivoted catch-hook and a spring normally holding said catch-hook in latching position, its end being suitably beveled to enter the female member automatically, and said female member having in its side wall an aperture serving the double purpose of providing a stop-shoulder for the catch-hook to engage in latching and a finger-opening for releasing the catch-hook in unlatching, substantially as set forth.

689,144. **MEANS FOR CLEANING SHIP'S HULL.** WALTER E. BUE, Albany, New South Wales, Australia. Filed July 12, 1901. Serial No. 67,948. (No model.)

Claim.—1. In a mechanism for cleaning a ship's hull, the combination of a curved carrier-rod, a rotatable cleaning-cylinder mounted on the

bow of said carrier-rod and provided with external cleaning elements, and means substantially as set forth for adjusting said cleaner-cylinder lengthwise of, and vertically with respect to, a ship's hull.

2. In a mechanism for cleaning a ship's hull, the combination of a carrier-rod provided with a rest, a carriage in which the carrier-rod is slidably fixed, an operating-shaft journaled in the carriage and having a gear element meshing with said rest, and a cleaner-cylinder rotatably mounted on the carrier-rod and provided with external cleaning elements, as and for the purposes set forth.

3. In a mechanism for cleaning a ship's hull, the combination of a vertical longitudinally-curved carrier-rod, an open-ended cleaner-cylinder rotatably mounted on said carrier-rod and provided with an internal propeller and with external brushes, a carriage having means for slidably supporting the same on the outside of a ship's hull, and operative connections between said carriage and the carrier-rod whereby the latter may be raised or lowered and may be adjusted laterally with respect to the hull, substantially as and for the purposes described.

4. In a machine for cleaning a ship's hull, the combination of a cleaner-cylinder open at both ends and provided with an internal propeller and with external spiral brushes, the pitch of said brushes corresponding to the pitch of the propeller, a carrier-rod on which said cleaner-cylinder is rotatably mounted, a carriage, and means for pivotally and adjustably connecting the carriage and the carrier-rod together and permitting said carrier-rod to swing on a horizontal axis and to perform the lateral movement with relation to the hull, substantially as and for the purposes set forth.

5. In a mechanism for cleaning a ship's hull, the combination of a slide-rod, a carriage mounted on said rod and adapted to be moved thereon, a carrier-rod fitted in said carriage and adjustable vertically therein, and a cleaner-cylinder supported by the carrier-rod, substantially as and for the purposes set forth.

6. In a mechanism for cleaning a ship's hull, the combination of bearing-bars supporting a slide-rod, means for slidably supporting said bearing-bars on the side of a ship's hull, a carriage slidably mounted on said rod, a carrier-rod adjustable in said carriage, and a cleaner-cylinder supported on the carrier-rod, as and for the purposes set forth.

7. In a mechanism for cleaning a ship's hull, the combination of a slide-rod, a carriage, a post having swivelled connection with the carriage and slidably fitted to the slide-rod, a carrier-rod adjustable in said carriage, and a cleaner-cylinder supported on the carrier-rod, substantially as and for the purposes set forth.

8. In a mechanism for cleaning a ship's hull, the combination of a cleaner-cylinder, means for adjustably and loosely preventing said cleaner-cylinder in a submerged condition and in operative relation to a ship's hull, a screw-spindle, a bow-plate connected to the spindle and adapted to fit a ship's bow, an operative connection between the bow-plate and the submerged cylinder, and means for adjusting said spindle and the bow-plate, as and for the purposes described.

689,145. **ANIMAL-TRAP.** JOHN B. BULLER, Bland, Ark. Filed July 13, 1901. Serial No. 68,194. (No model.)

Claim.—An attachment for animal-traps consisting of a guard member for attachment to the jaw and having outwardly-extending teeth or points 9 as and for the purposes specified.

689,146. **ELECTRIC COMBUSTION-FURNACE.** WILLIAM H. GARR, East St. Louis, Ill., assignor to Shultz, Harrison and Howard Iron Company, East St. Louis, Ill. Filed Mar. 3, 1902. Serial No. 68,696. (No model.)

Claim.—In an electric combustion-furnace, the combination with the combustion-tube, and with its inclosing cylinder, of two wires separate from each other, one of the said wires being wound spirally around the end portion of the said cylinder, and the other wire wound spirally around the middle portion of the said cylinder, and means for passing an electric current alternately through the wire around the said end portion

tion, and through both the said wires simultaneously, substantially as described.

699,147. ROLL. EDWARD E. CHARLTON, Milwaukee, Wis., assignor to the Continuous Roll Joint Company of America, a Corporation of New Jersey. Filed June 24, 1901. Serial No. 66,800. (No model.)

Claim.—A roll for rolling metal, having in its periphery an annular pass-groove one side wall of which is formed by a fixed portion of the roll and the other by a loose portion.

2. A roll for rolling metal, said roll presenting an annular peripheral pass-groove, and having an annular fixed flange forming one side wall of said groove and a rotatably loose ring or sleeve forming the other side wall of the groove.

3. A roll for rolling metal, having two peripherally-projecting flanges forming a pass-groove between themselves, one of said flanges being fixed and the other being rotatably loose.

4. A roll for rolling metal, having a fixed annular projection and a rotatably loose ring, said parts having their centers in the same axial line and being adapted to receive metal between themselves.

5. A roll for rolling metal, having at its periphery annular shoulders or projecting walls facing toward each other one of which is fixed and the other rotatably loose with respect to the roll.

6. A roll for rolling metal, having peripherally-projecting annular shoulders or walls adapted to engage the metal in rolling, one of said shoulders or walls being fixed and the other rotatably loose.

7. A roll, having a pass-groove, one side wall of which is fixed with respect to the body of the roll, a ring or sleeve fitted loosely on the body of said roll and forming the opposite side wall of said pass-groove, and means for preventing longitudinal displacement of said ring or sleeve.

8. A roll, having a rotatable pass-groove disposed at or nearly at right angles to the roll, a loose annular or transverse section of the roll forming one side wall of said pass-groove, and means for preventing displacement of said section longitudinally of the roll.

9. The herein-described roll, comprising a body part presenting an outwardly-projecting annular shoulder and having a spindle *f*, a ring or sleeve *c*, loose on said spindle and forming between itself and the said shoulder a pass-groove, and a holding-rod *h*, secured on said spindle outside the sleeve.

699,148. MEANS FOR FORMING FINE-PLATE. EDWARD E. CHARLTON, Milwaukee, Wis., assignor to the Continuous Roll Joint Company of America, a Corporation of New Jersey. Filed Aug. 10, 1901. Serial No. 71,611. (No model.)

Claim.—1. The herein-described die *g*, *h*, for forming guide *m*, on fish-plates, comprising a female die having at one lateral face a recess or groove *g'*, to receive a fish-plate, the upper overhanging edge of the die being cut away at its middle portion, and a male die *h*, adapted to fit at its lateral face against a fish-plate as it lies in the female member, and having a projection *h'*, to enter the recess in upper edge of said female member.

2. The herein-described means for forming an upright guide on the base member of fish-plates having an upright portion and doubled base, comprising a fixed die member grooved at its lateral face to receive the doubled base of the fish-plate and having a portion of its face at one side of said groove cut away to expose the base member of the fish-plate, and a reciprocating male die member having a face adapted to fit against a fish-plate as it lies in the female die member and having a projection to enter the cut-away portion thereof and bend up the exposed base member of the fish-plate.

3. The combination with the fixed die member *g*, having in its lateral face a groove *g'*, for holding a fish-plate in inverted position and a recess *g'*, exposing the base member of said fish-plate, a movable member *h*, having a projection *h'*, adapted to enter said recess *g'*, and bend up the exposed portion of the base member, and means for automatically supplying fish-plates in said inverted position.

4. The combination with means for delivering fish-plates of the character described each with its base in vertical position, of conveyor-rollers

f, adapted to give a fish-plate a quarter-turn, while carrying it forward, and bring its base uppermost, and bending-die adapted to receive between themselves a fish-plate in said position, and having one a recess exposing the base member and the other a projection adapted to enter said recess and bend up the exposed portion of said base member.

699,149. IMPROVED MACHINERY. EDWARD E. CHARLTON, Milwaukee, Wis., assignor to the Continuous Roll Joint Company of America, a Corporation of New Jersey. Filed Aug. 10, 1901. Serial No. 71,612. (No model.)

Claim.—1. In a building-block-embossing machine, a die comprising a casing and a core, brackets extended forward from the casing, rollers supported by the brackets, and an embossing-cylinder engaging with its inner surface against said rollers, substantially as specified.

2. In a building-block-embossing machine, a die comprising a casing and a core, brackets extended forward from the casing at opposite sides, rollers adjustable vertically in said brackets, and an embossing-cylinder having its inner surface engaged by said rollers, substantially as specified.

3. In a building-block-embossing machine, the combination with a die comprising a casing and a core, of brackets projecting from the casing, an embossing-cylinder, bearing-rollers for the cylinder at the ends of the brackets, and rollers mounted in the brackets intermediate of their ends and traveling on the inner surface of the embossing-cylinder, as set forth.

4. In a building-block-embossing machine, brackets for supporting an embossing-cylinder and brackets being adapted to be secured to the machine and each provided with an inclined slot at each end, a vertical slot at its middle, and a standard slot at its middle, as and for the purpose set forth.

699,150. ROLLER-PISTON-REGULATING VALVE AND DEVICE FOR OPERATING SAME. EDWARD E. CHARLTON, Milwaukee, Wis., assignor to the Continuous Roll Joint Company of America, a Corporation of New Jersey. Filed Aug. 10, 1901. Serial No. 71,613. (No model.)

Claim.—1. The combination with an open-ended valve-rod having spaced ports opening thereinto between its ends, and continued throughout the inner circumference of the rod, of a valve disposed slidably in the rod and adapted successively to cover both ports and to uncover them, said valve having a passage therethrough and opening therefrom beyond the ports when the valve is in position to cover both ports.

2. The combination with a valve-rod having connections at both ends for supplying fluid-pressure thereto, said valve-rod having ports leading thereto between its ends and being continued at their inner ends, of a valve slidably disposed in the rod to cover and uncover the ports, said valve having a passage therethrough for conveying fluid under pressure from one to the other of said connections, a rocker connected with the valve and carrying spaced abutments, a seat, and a lever carried by the seat and having a projection to engage the said abutments.

3. The combination with a valve-rod having a port therein, of a valve in the rod for opening and closing the port, a rocker pivoted for movement from one side to the other of its center of oscillation and operatively connected with the valve to move it into open and closed position, a frame connected to the rocker above its pivot, a spring connected to the frame below the pivot of the rocker for holding the rocker yieldably at either side of its center of oscillation, a fluid-lever operatively connected with the rocker to move it over its center of oscillation, and stops carried by the frame for limiting the movement of the valve in either direction under the influence of said spring.

699,150

699,151. CAMER FOR HORSE-COLLAR. ARTHUR C. OWEN, Atlanta, Ga., assignor to Owen Brothers & J. J. Ryan Company, Atlanta, Ga., a Corporation of Georgia. Filed Oct. 7, 1901. Serial No. 77,804. (No model.)

Claim.—1. A casing for a section of a horse-collar, consisting of a single piece of material provided with a V-shaped notch and folded upon itself into two unequal parts, the edges of the notch substantially meeting and being attached together, the wider part of the casing being folded inward upon itself to form a rim, the edge of the narrower part of the casing being turned inward but overlapping the folded portion of the wider part of the casing, the whole being united by stitching from the outside through the overlapping portions of the casing, substantially as described.

2. A casing for a section of a horse-collar, consisting of a single piece of material provided with a V-shaped notch and folded upon itself into two unequal parts, the edges of the notch substantially meeting and being attached together, the wider part of the casing being folded inward upon itself to form a rim and held by a line of stitching, the edge of the narrower part of the casing being also turned inward but overlapping the stitching of the rim, the whole being united from the outside by stitching through the folded portions and parts of the casing, and the material being gathered near the notched portion to give a curved shape to the casing when stretched, substantially as described.

3. A casing for a section of a horse-collar, consisting of a single piece of material provided with a V-shaped notch and folded upon itself into two unequal parts, the edges of the notch substantially meeting and being attached together, the wider part of the casing being folded inward upon itself to form a rim and held by a line of stitching, the edge of

the narrower part of the casing being also turned inward but overlapping the stitching of the rim, the whole being united from the outside by substantially parallel rows of stitching through the folded portions and parts of the casing, substantially as described.

4. A casing for a section of a horse-collar, consisting of a single piece of material provided with a V-shaped notch and folded upon itself into two unequal parts, the edges of the notch being stitched together, the wider part of the casing being folded inward to form a rim, the edge of the narrower part of the casing overlapping the folded portion of the wider part, the whole being united by stitching from the outside through the overlapping portions of the casing, substantially as described.

5. A casing for a section of a horse-collar, consisting of a piece of material provided with a notch and folded upon itself into two parts, the edges of the notch being stitched together, one part of the casing being folded inward to form a rim, the edge of the other part of the casing overlapping said inwardly-folded portion, and the whole being united by stitching through the overlapping portions of the casing, substantially as described.

6. A casing for a section of a horse-collar, consisting of a piece of material provided with a notch and folded upon itself, one portion of the casing being folded inward to form a rim and another portion overlapping said inwardly-folded portion, the whole being united by stitching, substantially as described.

699,153. RING-SPINNING, DOUBLING, OR TWISTING MACHINE. FREDERICK P. GRAVER, Manchester, England. Filed May 14, 1907. Serial No. 51,886. (No model.)

Claim.—1. In combination in the disk of a ring-spinning, doubling, or twisting machine spindle, the disk-springs adapted to exert pressure upon the sides of the spindle and a case or cover including the said springs between itself and the disk substantially as described.

2. In the disk of a ring-spinning, doubling, or twisting machine spindle the construction of the disk in two pieces, a of sheet metal or other suitable material, having the springs *y* located between them, one of the said pieces *b* being formed with recesses *z* adapted to receive and hold the fixed ends of the springs *y* substantially as described.

3. In ring-spinning, doubling or twisting machine the combination with the ring-roll 3 and spindle-disk 5 of a lifting-piece 2 attached to the ring-roll 3 and adapted to come in contact with the under side of the disk 5, as the ring-roll 3 approaches the end of each upward movement, before the traveler 4 reaches the said disk, substantially as described.

4. In ring-spinning, doubling, or twisting machine the combination with the disk-lifting piece 2, of the traveler-clearing device 5 and lifting-piece 2 being arranged to lift the disk and prevent engagement of the traveler therewith substantially as described.

699,158. TAPE-REELER. THOMAS A. GREEN, Norwich, N. Y. Filed July 6, 1904. Serial No. 67,364. (No model.)

Claim.—1. A combined loop pick-up and ribbon-tube for machines for inserting ribbon in lace, consisting of a needle-body, and a ribbon-tube attached to the one end of said needle-body, the said tube being provided with a hole near the point of attachment of the said ribbon-tube to said needle-body, the said hole extending through the side of the said ribbon-tube into the tubular portion of the said ribbon-tube, into which a piece of ribbon is inserted and passed through the said tube, substantially as and for the purposes set forth.

2. A combined loop pick-up and ribbon-tube for machines for inserting ribbon in lace, consisting of a needle-body having at one end a curved "pick-up" for gathering lace upon said needle-body, and a ribbon-tube secured to the other end of said needle-body, said tube having an oval or elliptical shape in cross-section, and said tube having an opening near the end of its attachment to the needle-body, substantially as and for the purposes set forth.

699,154. FLOWER-STAND. MARY A. DE FOSSE, CURT, Pa., assignor of two-thirds to Dennis Fosse and George A. Williams, Juncos-town, N. Y. Filed Aug. 26, 1904. Serial No. 73,686. (No model.)

Claim.—1. In a flower-stand, a complete stand made of pipe and suitable couplings thereto, flower-pot cups on said pipe having openings into said pipe as a receptacle for drainage, and means for controlling the confinement and discharge of said drainage as desired, substantially as shown and described.

2. In a flower-stand, a complete movable stand made of pipe and suitable couplings thereto, cups on said pipe having openings for drainage into said pipe as a temporary receptacle, a stop-cock or faucet secured in said pipe near its lower part to confine or empty said drainage as desired, and wheels or casters on said stand for moving it about, substantially as shown and for the purposes specified.

699,155. PREPARATION OF COLLOID FOR THE MANUFACTURE OF ARTIFICIAL SILK. JULIUS DUBOIS, Paris, France. Filed Mar. 4, 1902. Serial No. 97,008. (No specimens.)

Claim.—1. The process above described for manufacturing artificial silk by means of cellulose obtained by the solution of pyruvic acid at low temperatures until it contains six to ten per cent. of water, is a mixture compounded according to the quality of the cellulose employed of ether, alcohol and an aqueous alkaline solution (potash, soda, ammoniac, or their carbonates, lithia, lime, baryta, sodium borate, potassium or sodium silicate or the like).

2. The process of preparing cellulose for the manufacture of artificial silk which consists in washing pyruvic acid, subjecting it to centrifugal action to eliminate water therefrom, exposing the same to a drying atmosphere until it is brought to a hygroscopic condition of about six to ten per cent., and subjecting it to the action of a mixture of alcohol, ether and an aqueous alkaline solution.

3. The process of preparing cellulose for the manufacture of artificial silk which consists in washing pyruvic acid, subjecting it to centrifugal action to eliminate water therefrom, exposing the same to a drying atmosphere until it is brought to a hygroscopic condition of about six to ten per cent., and subjecting it to the action of a solvent.

4. The process of preparing cellulose for the manufacture of artificial silk which consists in subjecting pyruvic acid to the action of a mixture of alcohol, ether, and an alkaline solution.

5. The process of preparing cellulose for the manufacture of artificial silk which consists in bringing pyruvic acid to a hygroscopic condition

of about six to ten per cent. and subjecting it to the action of a mixture of alcohol, ether and an alkaline solution.

699,156. COMPRESSED-AIR HEATER. CHARLES E. DUNN, New York, N. Y., assignor to John C. Henderson, New York, N. Y. Filed Jan. 12, 1901. Serial No. 68,864. (No model.)

Claim.—1. In a compressed-air heater, the combination with a motor adapted to be driven by compressed air, of a compressed-air chamber, an expanding-chamber provided with an air-inlet, a burner within the expanding-chamber for heating the air, and wire screens arranged in the expanding-chamber and interspersed between the burner and the air-inlet, substantially as described.

2. In a compressed-air heater, the combination with an expanding-chamber of a liquid-supply pipe entering the lower portion thereof, a burner at the termination of the said pipe within the chamber, an air inlet and outlet at the upper end of the chamber, and a series of horizontally-arranged wire screens or diaphragms in the chamber interspersed between the burner and the air inlet and outlet, substantially as described.

3. In a compressed-air heater, the combination with an expanding-chamber of a liquid-supply pipe entering the lower portion thereof, an outlet-pipe at the upper end of the chamber, a compressed-air inlet pipe also at the upper end of the chamber, a burner at the termination of the liquid-supply pipe within said chamber, a wire-glass head covering the same, and a plurality of wire-glass diaphragms arranged in the expanding-chamber, dividing the portion of the said chamber which contains the liquid from the portion of the chamber having the inlet and outlet pipes for compressed air, substantially as described.

699,157. WINDOW-CURTAIN. FRANKLIN C. BARNHAM, Cambridge, and ALBERT S. BARNHAM, Brooklyn, Mass. Filed Oct. 7, 1904. Serial No. 77,816. (No model.)

Claim.—1. In a window-curtain of the character described, corner-plates, each comprising two interlocking longitudinally channel-shaped plates disposed with the channel and web of one plate opposite the channel and web of the other plate, thereby producing a hollow corner-plate; and intermediate side, top and bottom bars connecting said corner-plates, and interlocking or interlocking therewith, substantially as set forth.

2. In a window-curtain of the character described, corner-plates, each comprising two interlocking longitudinally channel-shaped plates disposed with the channel and web of one plate opposite the channel and web of the other plate, thereby producing a hollow corner-plate; and each said bar comprising two interlocking longitudinally channel-shaped plates disposed with the channel and web of one plate opposite the channel and web of the other plate, said intermediate bars interlocking or interlocking with the corner-plates, substantially as described.

3. In a window-curtain of the character described, corner-plates, each comprising two interlocking longitudinally channel-shaped plates disposed with the channel and web of one plate opposite the channel and web of the other plate, thereby producing a hollow corner-plate; and intermediate side, top and bottom bars connecting said corner-plates, and each said bar comprising two interlocking longitudinally channel-shaped plates disposed with the channel and web of one plate opposite the channel and web of the other plate, said intermediate bars interlocking or interlocking with the corner-plates, the joints of the portions constituting the corner-plates and the portions constituting the intermediate bars being non-extended, substantially as set forth.

4. In a window-curtain of the character described, corner-plates, each comprising two oppositely-disposed interlocking channel-shaped bars; intermediate side, bottom and top rails, each comprising two oppositely-disposed interlocking channel-shaped bars, the intermediate bars interlocking with the corner-plates; and covering-bars extending along one side of the frame thus constructed and interlocking with the pairs of channel-shaped bars in the corner-plates and intermediate rails, substantially as described.

5. In a window-curtain of the character described, the corner-plates, each consisting of the bar consisting of the web *D*, flanges *D'*, *D''*, and flaps *D'''*, *D''''*, said flange *D'* and flap *D''* being continuous at and around the corner, and the bar consisting of the web *E*, flanges *E'*, *E''* and flaps *E'''*, *E''''*, said flange *E'* and flap *E''* being continuous at and around the corner; and the intermediate rails each consisting of the bar consisting of the web *F*, flanges *F'* and flaps *F''*, and the opposite bar *G* of similar shape to the bar *D*, *D'*, *D''*, *D'''*, *D''''*, the bars of the corner-plates and those of the intermediate rails interlocking, substantially as set forth.

6. In a window-curtain of the character described, the corner-plates, each consisting of the bar consisting of the web *D*, flanges *D'*, *D''*, and flaps *D'''*, *D''''*, said flange *D'* and flap *D''* being continuous at and around the corner, and the bar consisting of the web *E*, flanges *E'*, *E''* and flaps *E'''*, *E''''*, said flange *E'* and flap *E''* being continuous at and around the corner; the intermediate rails, each consisting of the bar consisting of the web *F*, flanges *F'* and flaps *F''*, and the opposite bar *G* of similar shape to the bar *D*, *D'*, *D''*, *D'''*, *D''''*, the bars of the corner-plates and those of the intermediate rails interlocking; and the angle-shaped covering-bars *K*, *K'*, their flaps *K''* extending into engagement with the corner-plates between the flaps *D'''* and flanges *E'* and between corresponding flaps and flanges in the intermediate rails, substantially as described.

7. In a window-curtain of the character described, hollow corner-plates; engaging clips having their shafts extending into the corner-plates and with hook-shaped outer ends extending beyond the edges of the frame of the curtain; compressed springs within the corner-plates connecting the shafts of the clips with the corner-plates; and a runway or vertically-grooved guide next the window-frame into which the clips extend, substantially as set forth.

8. In a window-curtain of the character described, hollow corner-plates; the engaging clips *B*, *B'*, *B''* having their shafts extending into the corner-plates on one side of the frame; compressed springs within the corner-plates connected at one end with the shafts and at the other end with the corner-plates; the engaging clips *C*, *C'*, *C''* extending from the corner-plates on the opposite side of the frame of the curtain and rigidly secured to said corner-plates; and the grooved guides *A*, *A'*, *A''*, *A'''*, *A''''* secured vertically to the window-frame and engaging with the clips, substantially as described.

699,158. WIRELESS-TELEGRAPH SYSTEM. CHARLES R. BAKER, Washington, D. C., assignor of one-half to American Wireless Telephone and Telegraph Company, a Corporation of Arizona. Filed Dec. 2, 1901. Serial No. 94,518. (No model.)

Claim.—1. In a signaling system, the combination of dissimilar wave-responsive devices conjointly controlling a translating device.

2. In a signaling system, the combination of dissimilar wave-responsive devices each having associated therewith a local circuit, said circuits being conjointly operative to produce a signal.

3. In a signaling system, the combination of dissimilar wave-responsive devices, and means controlled by each type of device, said means operating conjointly to produce a signal.

4. In a signaling system, the combination of dissimilar wave-responsive devices, and separate means controlled by each type of device, said means operating conjointly to produce a signal.

5. In a signaling system, a receiver selective of waves of two or more periodicities; dissimilar wave-responsive devices influenced by the waves of different frequencies; and separate means controlled by said wave-responsive devices, said means operating conjointly to produce a signal.

6. In a signaling system, the combination of dissimilar wave-responsive devices, and local circuits controlled by said devices, each of said circuits including a coil of a relay, said coils operating differentially on the magnetic circuit of said relay, substantially as described.

7. In a receiver, the combination of a receiver and an antireceiver, conjointly controlling a translating device.

8. In a receiver, the combination of a receiver and an antireceiver, a local circuit associated with each, and means for producing a signal controlled by said local circuits.

9. In a receiver, a receiver and an antireceiver, means controlled by each, said means operating conjointly to produce a signal.

10. In a receiver, the combination of a receiver and an antireceiver, a separate means controlled by each, said means operating conjointly to produce a signal.

11. A receiver selective of energies of different frequencies; a receiver and an antireceiver influenced respectively by the different energies, and means, conjointly operative to produce a signal, controlled by the receiver and antireceiver.

12. In a receiver, the combination of a receiver and an antireceiver, a local circuit controlled by each, a coil of a relay included in each circuit, said coils operating differentially on the magnetic circuit of said relay, substantially as described.

699,159. GEAR FOR WARPING-MACHINE. THOMAS C. BETHUNE, Lowell, Mass. Filed Oct. 31, 1900. Serial No. 736,396. (No model.)

Claim.—1. The combination with an upright, having a segmental cylindrical recess, of a hollow cylindrical bearing, adapted to fit said recess and to project laterally therefrom and having a lateral opening.

2. The combination with an upright, having a segmental cylindrical recess, the plane of section or segmental face of said recess coinciding with the vertical face of said upright, of a bearing, having a circular and provided with an arc-shaped marginal flange or curb, arranged perpendicularly thereto, the inner face of said flange near the ends of said flange being inclined outward and meeting the outer curved face of the recess and the lower end of said flange projecting beyond the face of said upright.

699,160. APPARATUS FOR DISPENSING ELECTRICITY IN DELIVERING CURRENTS INTO OR FROM PRINTING-PRESSES. FRANK A. STILES, Harrisburg, Pa., assignor of one-half to Hugo Henry, Harrisburg, Pa. Filed Feb. 2, 1901. Serial No. 48,728. (No model.)

Claim.—1. In a device for dispensing electricity from printing-presses, a half-oval or other shaped tube having a series of burners arranged in a line upon the top thereof, atmospheric inlets in one end of the said tube, a detachable wire-glass screen over the said burners and a connection to a supply-pipe, substantially as shown and described.

2. A device for dispensing electricity from paper, in combination with a printing-press, a half-oval or other shaped tube closed at both ends, a series of burners arranged upon the tube, a detachable wire-glass screen over the said burners, atmospheric inlets in one end of the tube and a connection to a supply-pipe, substantially as shown and described.

699,161. PANORAMIC CAMERA. JAMES FOSBERG, New York, N. Y., assignor to Eastman Kodak Company, Rochester, N. Y., a Corporation of New York. Filed Nov. 7, 1900. Serial No. 736,182. (No model.)

Claim.—1. In a panoramic camera, a lens and its holder and means for pivoting the holder under tension tending to swing it in either of two opposite directions to make an exposure, substantially as set forth.

2. In a panoramic camera, a lens and its holder provided with a light-confining tube, and a single operating device for swinging the lens-holder in either of two opposite directions to make an exposure, substantially as set forth.

3. In a panoramic camera, a lens and its holder provided with a light-confining tube, a tension-spring arranged to swing the lens-holder in opposite directions and means for setting the spring, substantially as set forth.

4. In a panoramic camera, a lens and its holder provided with a light-confining tube, means for swinging the lens-holder in opposite directions and a locking device under the control of the lens-holder-swinging means for temporarily locking the lens-holder at the limits of its swinging movement, substantially as set forth.

5. In a panoramic camera, a lens and its holder provided with a light-confining tube, a spring for swinging the holder in opposite directions, means for temporarily locking the lens-holder at the limits of its swinging movement and a device for imparting tension to the spring and releasing the lens-holder, substantially as set forth.

6. In a panoramic camera, a lens and its holder, an operating-disk having a pin-and-dot engagement therewith, a tension-spring, a device for temporarily locking the said disk and means for imparting tension to the said spring tending to swing the holder and for releasing the disk and thereby the holder, substantially as set forth.

7. In a panoramic camera, a lens and its holder mounted to swing, a stub-axis, a rotary disk carried thereby having a radial elongated dot therein, a pin carried by the holder in engagement with the said dot and a tension-spring engaged with the disk and the axis whereby rotary movement of the axis will impart a tension to the spring to swing the disk and thereby the holder, substantially as set forth.

8. In a panoramic camera, a lens and its holder mounted to swing, a stub-axis, a holder-operating disk carried thereby, a spring for locking the disk and means for releasing the spring comprising an arm loosely carried by the said axis and a tripping-arm fixed to the axis in position to operate the first-named arm as the axis is rotated, substantially as set forth.

9. In a panoramic camera, a lens and its holder mounted to swing, a stub-axis, a holder-operating disk mounted thereon, a tension-spring secured to said disk and having a flexible connection with the said axis whereby, as the axis is rotated, the spring will tend to rotate the disk and thereby the holder in a corresponding direction, substantially as set forth.

10. In a panoramic camera, a lens and its holder provided with a light-confining tube, means for swinging the holder and tube in opposite directions and ventholes for closing the inner end of the tube at the limits of its swinging movement comprising flexible flaps projecting into the path of the swinging movement of the tube, substantially as set forth.

11. In a panoramic camera, a camera-box having a removable bottom, top and bottom marginal guides covered within the box independently of the said bottom, and axis-pins for receiving the film-edges having their free ends removably engaged in the said bottom, substantially as set forth.

12. In a panoramic camera, a lens and its holder mounted to swing, a stub-axis, a holder-operating disk carried thereby, a spring for locking the disk and means for engaging the spring to release the disk and permit the spring to again return to its locking position, substantially as set forth.

13. In a panoramic camera, a lens, a light-directing chamber pivoted to swing together with the lens in opposite directions and means for swinging the said light-directing chamber and lens to make an exposure during the swinging movement in each of the two opposite directions, substantially as set forth.

14. In a panoramic camera, a lens, and light-directing chamber pivotedly mounted to swing together in opposite directions, means for swinging the lens and light-directing chamber to effect an exposure during the opposite swinging movements, and means for automatically locking the lens and light-directing chamber at both ends of each swinging movement, substantially as set forth.

15. In a panoramic camera, the combination with film-holding device embodying curved film-guides, and a pivoted oscillatory tube, of a reversible spring-motor for actuating the tube in opposite directions alternately, and a catch for retaining and releasing the tube.

16. In a panoramic camera, the combination with film-holding device embodying curved film-guides, and film-chambers at the ends, of a pivoted oscillatory tube, one end of which is movable over the film-guides and into line with the closed sides of the film-chambers, a reversible spring-motor for actuating the tube in opposite directions alternately, and a catch for retaining and releasing the tube.

17. In a panoramic camera, the combination with curved film-guides, the film-chambers at the ends, and the flaps on the inner sides of the walls of the chambers, of the pivoted oscillatory tube, one end of which is movable over the film-guides and beyond the flaps, a reversible spring-motor for actuating the tube in opposite directions alternately, and a catch for retaining and releasing the tube.

18. In a panoramic camera the combination with a suitable case having a curved film-support and a swinging lens-holder adapted to turn on an axis concentric with said film-support, of mechanism adapted to turn said lens-holder alternately in opposite directions and comprising an actuating-spring, means for straining said spring and resetting said mechanism after each exposure for the next exposure, and means for manually releasing said mechanism, substantially as and for the purposes set forth.

699,162. TELEPHONE-CIRCUIT SYSTEM. RALPH F. FINE, Washington, D. C. Filed Nov. 12, 1900. Serial No. 56,628. (No model.)

Claim.—1. In a telephone-circuit system, a plurality of telephone-lines, a common return or battery-supply line, combined with a condenser, one side of which is connected to the earth, the other side of which is connected to the common return or battery-supply line, for the purposes specified.

2. In a telephone-circuit system, a plurality of telephone-lines, a common return or battery-supply line, a source of electric energy one pole of which is connected to the earth the other pole of which is connected to the common return or battery-supply line, combined with a condenser one side of which is connected to the earth the other side of which is connected to the said common return or battery-supply line for the purposes specified.

3. In a telephone-circuit system, a condenser, a telephone-circuit comprising a telephone-line and a common return-line, the latter of which is connected to the earth through said condenser.

4. In a telephone-circuit system, a telephone-circuit comprising a telephone-line and a common return-line, the latter of which is of relatively high static capacity to that of the former.

5. In a telephone-circuit system, a telephone-circuit comprising a telephone-line and a common return-line, the latter of which is of relatively high static capacity and low inductance to that of the former.

699,163. BOOK AND EYE. JUDITHA PETER, Chelsea, Mass. Filed Jan. 24, 1902. Serial No. 81,007. (No model.)

Claim.—The herein-described book for books and eyes, comprising the wire having its central portion formed into the raised tongue A and being bent from the tongue oppositely outward and downward into the loops B adapted to be curled to the garment near the edge thereof; and the wire extending from the outer edges of said loops inward toward each other, and then constituting inwardly-extending arms C, D, said arms crossing each other at substantially right angles centrally under the raised tongue A, and extending beyond each other as shown, the arm D being provided with a pointed end and curving the arm C between it and the tongue, whereby the arm C presses the central portion of the arm D toward the under side of the tongue to prevent withdrawal of the eye, the book being thus secured to the fabric in three places and bearing upon it in four places, substantially as described.

699,164. WIRE-TWISTING FLIER. JOHN R. GOSSETT, Philadelphia, Pa. Filed June 20, 1901. Serial No. 66,078. (No model.)

Claim.—1. In a tool of the character described, two jaws pivoted together, handles formed with said jaws, said jaws being formed within the jaws, said jaws being adapted to enter and rotate within the grooves in the blocks, said flanges adapted to enter and rotate within the grooves in the blocks, substantially as described.

jaws, ratchet-teeth formed upon the periphery of the semicircular block, a pawl pivoted in one of the jaws and adapted to engage the ratchet-teeth, semicircular grooves formed laterally across the flat face of each of the semicircular blocks, said grooves adapted to register with one another when the blocks are brought together for the purpose of grasping the article to be twisted, substantially as described and for the purpose set forth.

2. In combination with a pair of plates, two semicircular blocks, grooves formed laterally across the flat face of said semicircular blocks for the purpose of grasping the articles to be twisted, means for guiding the semicircular blocks within the jaws of the plates so as to allow said blocks to rotate when the jaws are together, ratchet-teeth formed in the periphery of the semicircular blocks, a pawl pivoted in one of the jaws of the plates and adapted to engage the ratchet-teeth, a spring adapted to hold the pawl in engagement with the ratchet-teeth, and a frictional spring adapted to bear against the block opposite from the one in engagement with the pawl, substantially as and for the purpose specified.

699,165. COTTON-CHOPPER. JAMES M. GRANT, JR., Ark. Filed Feb. 28, 1901. Serial No. 63,696. (No model.)

Claim.—1. In a cotton-chopper, the combination with a supporting-beam, of a standard movable longitudinally on said beam, a bar carried by said beam and locking said standard from longitudinal movement, a shaft carried by said standard, a support for the opposite end of said shaft, and a chopper carried by said shaft, substantially as described.

2. In a cotton-chopper, the combination with a beam, of a bifurcated standard having the legs thereof extending on the respective sides of the beam and connected above said beam, a bar pivoted to the beam and formed with slots engaging a projection carried by the standard, a shaft supported at one end in said standard, a bifurcated standard depending from the beam and receiving the opposite end of said shaft, a sleeve on said shaft between the bifurcations of the standard, and a chopper carried by said shaft, substantially as described.

699,166. APPARATUS FOR PURIFYING AIR. DAVID GROVE, Berlin, Germany. Filed May 29, 1900. Serial No. 714,736. (No model.)

Claim.—1. Is an air purifying and cooling apparatus, one or more series of air-channels, formed of partitions or walls of air-purifying material and arranged one behind the other, diagonally to the direction of the air, in combination with a water-distributing vessel above the air-channels

and a cloth immersed in the vessel, the edges of each cloth being located on the air-purifying material, as and for the purpose described.

699,167. SWITCH-ACTUATING MECHANISM. JOSEPH P. HARTY, Superior, Neb. Filed Aug. 21, 1901. Serial No. 72,794. (No model.)

Claim.—1. The combination of the switch, the spindle, intermediate mechanism comprising levers and a connecting-rod, and a weight bearing on said levers to hold the switch as adjusted.

2. The combination of the switch, the spindle, intermediate mechanism comprising levers and a connecting-rod, and a weight bearing on said levers to hold the switch as adjusted, a part of said levers being pivoted to the spindle.

3. The combination of the switch, the rotatable spindle, intermediate mechanism comprising levers and a connecting-rod, a weight bearing on said levers to hold the switch as adjusted, and a signal fixed to the spindle.

4. The combination of the switch, the spindle, intermediate mechanism comprising levers and a connecting-rod, and a weight bearing on said levers to hold the switch as adjusted, said spindle being held against longitudinal movement.

699,168. PRISMATIC BINOCULAR TELESCOPE. FREDERICK R. HILL, London, England, assignor to Thomas Rudolph Hillier, county of Middlesex, England. Filed Sept. 30, 1901. Serial No. 77,066. (No model.)

Claim.—1. In a prismatic binocular telescope, the combination of a framework consisting of two parallel plates rigidly connected together and extending from side to side of the instrument, guides on one of the plates, a slide working in the guides, and an eyepiece-tube fixed to the slide.

2. In a prismatic binocular telescope, the combination of a framework consisting of two parallel plates rigidly connected together and extending from side to side of the instrument, two pairs of prisms carried by one plate, a pair of prisms and a pair of objective-tubes carried by the other plate, guides on the first plate, a pair of slides working in the guides, an eyepiece-tube fixed to each slide, and a prism fixed to each eyepiece-tube.

3. In a prismatic binocular telescope, the combination of a framework consisting of two parallel plates rigidly connected together and extending from side to side of the instrument, two pairs of prisms carried by one plate, a pair of prisms and a pair of objective-tubes carried by the other plate, guides on the first plate, a pair of slides working in the guides, an eyepiece-tube fixed to each slide, and a prism fixed to each eyepiece-tube.

extending from side to side of the instrument, a pair of objective-tubes passing through holes in one of the plates, and means for moving the objective-tubes in and out in the holes.

4. In a prismatic binocular telescope, the combination of a base-plate, a spring fixed to the base-plate, means on the base-plate and spring suitable for engaging with the edges of the prism, and a pivot about which the base-plate can turn.

5. In a prismatic binocular telescope, the combination of a framework consisting of two parallel plates rigidly connected together and extending from side to side of the instrument, two pairs of prisms carried by one plate, a pair of prisms carried by the other plate, guides on the first plate, a pair of slides working in the guides, an eyepiece-tube fixed to each slide, a prism fixed to each eyepiece-tube, a pair of objective-tubes passing through holes in the second plate, and means for moving the objective-tubes in and out in the holes.

6. In a prismatic binocular telescope, the combination of a framework consisting of two parallel plates rigidly connected together and extending from side to side of the instrument, three pairs of prism-holders, each prism-holder consisting of a base-plate, a spring fixed to the base-plate and means on the base-plate and spring for engaging with the edges of the prism, prisms in the holders, pivots connecting two pairs of the prism-holders to one plate and one pair to the other plate, guides on the first plate, a pair of slides working in the guides, an eyepiece-tube fixed to each slide, a prism fixed to each eyepiece-tube, a pair of objective-tubes passing through holes in the second plate, and means for moving the objective-tubes in and out in the holes.

7. In a prismatic binocular telescope, the combination of a framework consisting of two parallel plates rigidly connected together and extending from side to side of the instrument, guides on one of the plates, a slide working in the guides, an eyepiece-tube fixed to the slide and a prism fixed to the eyepiece-tube.

699,169. DUMPING-VEHICLE. THOMAS HILL, Jersey City, N. J. Filed Sept. 27, 1901. Serial No. 76,766. (No model.)

Claim.—1. In a dumping-vehicle, the side frames having the rear downwardly-turned bearing-surfaces 22 and slotted guide-frames 24, combined with the vehicle-body, the frame 24 secured to said body and comprising in one integral piece the transverse bar 25 and bearing-legs 29 and the shaft 27 mounted in said legs 29 and at its ends offering transverse extensions 30 into said slotted guide-frames; substantially as set forth.

2. In a dumping-vehicle, the side frames having the rear downwardly-turned bearing-surfaces 22 and slotted guide-frames 24, said side frames at a point to the front of said frames 24 having recesses which are open at their top at a point to the front of said surfaces 22, combined with the springs held within said recesses and exposed at the open top thereof, and the vehicle-body extending over said side frames and adapted to cushion on said springs, said springs being in line with said surfaces 22; substantially as set forth.

3. In a dumping-vehicle, the side frames having the rear downwardly-turned bearing-surfaces 22 and slotted guide-frames 24, combined with the vehicle-body, the frame 24 secured to said body and comprising the transverse bar 25 and longitudinal arms 26, and the shaft 27 mounted in said transverse bar and offering transverse extensions 30 into said slotted guide-frames, said arms 26 offering surfaces 28 for riding on said bearing-surfaces 22 during the dumping of said body; substantially as set forth.

4. In a dumping-vehicle, the side frames having the rear downwardly-turned bearing-surfaces 22 and slotted guide-frames 24, combined with the vehicle-body, the frame 24 secured to said body and comprising the transverse bar 25 and longitudinal arms 26, the shaft 27 mounted in said

transverse bar and offering transverse extensions 30 into said slotted guide-frames, the side frames for the vehicle-body, and the springs substantially concealed within said side frames and exposed at their upper ends, said arms 26 offering surfaces for riding on said bearing-surfaces 22 and also for engaging said springs; substantially as set forth.

5. The vehicle side frames having on their vertical sides the ears and at their lower ends the transverse flanges, and the axle-bar set between said flanges, combined with the parallel tie-rods connecting said side frames and having their ends extended downward through said ears, and the clip-plates securing said axle-bar and secured upon the mid ends of said tie-rods; substantially as set forth.

6. The vehicle-body having the transverse, combined with the side frames, and the shoes at the rear ends thereof and comprising in one integral piece the body portion, the downwardly-turned bearing portion and the slotted guide-frame to receive the body-transverse, the outer side of said shoes being in line with the front edges of said slotted frames; substantially as set forth.

7. The vehicle-body having the transverse, combined with the side frames, and the shoes at the rear ends thereof and comprising in one integral piece the body portion, the downwardly-turned bearing portion and the slotted guide-frame to receive the body-transverse, the outer side of said shoes being in line with the front edges of said slotted frames; substantially as set forth.

8. The vehicle-body having the transverse, combined with the side frames, the shoes at the rear ends thereof and comprising in one integral piece the body portion, the downwardly-turned bearing portion and the slotted guide-frame to receive the body-transverse, said shoes containing the openings in their top sides, combined with the springs substantially concealed within said shoes except at said openings for cushioning the vehicle-body; substantially as set forth.

9. The vehicle-body having the transverse, combined with the side frames, the shoes at the rear ends thereof and comprising in one integral piece the body portion, the downwardly-turned bearing portion, the slotted guide-frame to receive the body-transverse, the vertical ears on the inner side of said body portion, and the transverse flanges on the lower side of said body portion, the axle-bar confined between said flanges, the bolts passing through said ears at opposite sides of said axle-bar, and the clip-plates secured on said bolts and binding said axle-bar in position; substantially as set forth.

10. The vehicle-body having the transverse, combined with the side frames, the shoes at the rear ends thereof and comprising in one integral piece the body portion, the downwardly-turned bearing portion, the slotted guide-frame to receive the body-transverse, the vertical ears on the inner side of said body portion, and the transverse flanges on the lower side of said body portion, the axle-bar confined between said flanges, the parallel tie-rods having their downwardly-turned ends extended through said ears, and the clip-plates secured on said ends and binding said axle-bar in position; substantially as set forth.

699,170. STEAM-TRAP. JAMES W. HODSON, Jersey City, N. J., assignor of one-half to Henry C. Von, New York, N. Y. Filed Aug. 22, 1901. Serial No. 72,962. (No model.)

Claim.—1. A device of the class herein described comprising a horizontal body member having a valve-controlled outlet-port, as 6"; a diaphragm within said body member below said port, and having an orifice, as 7"; a float within said body member above said diaphragm, the said float being provided with a valve adapted to control said orifice; and means for limiting the rising and the falling movements of said float, the said body member being provided with a suitable inlet-opening substantially as herein specified.

2. A device of the class herein described comprising a hollow body member having a valve-controlled outlet-port, as 8"; a diaphragm within said body member, below said part, and having an orifice, as 7"; a valve for controlling said orifice; a float within said body member, above said diaphragm, the said float being adapted to rise and fall in its movements control the action of the valve last named; and means for limiting the rising and falling movements, respectively, of said float, the said body member being provided with a suitable inlet-opening, substantially as herein specified.

3. A device of the class herein described comprising a hollow body member provided with a valve-controlled outlet-port, as 8"; a diaphragm within said body member, below said part, and provided with an orifice, as 7"; a float within said body member, above said part; a float within said body member, between said diaphragm and said float, adapted to rise and fall, the said float being provided with a valve at its lower end for controlling the orifice in said diaphragm and with a stem at its upper end loosely engaging said float; and steps, as 7 7', engaging said stem one above and the other below said float and adapted to limit the rising and falling movements, respectively, of said float, the said steps each permitting of adjustment along said stem, and said body member being provided with a suitable inlet-opening, substantially as herein specified.

4. A device of the class herein described comprising a hollow body member having a valve-controlled outlet-port, as 8"; a diaphragm within said body member, below said part, and having an orifice, as 7"; a float within said body member, above said part, and having a suitable central orifice; a float within said body member, between said diaphragm and said float, adapted to rise and fall, the said float being provided with a needle-valve depending from the lower end thereof and adapted to control the orifice in said diaphragm, and with a threaded stem at its upper end projecting upwardly through the orifice in said float; and means, on said threaded stem, one above and the other below said float, and whereby the rising and falling movements, respectively, of said float may be limited, the said body member being provided with a suitable inlet-opening, substantially as herein specified.

699,171. TREADLE-MOTOR. GEORGE HUGHES, Jamaica, N. Y. Filed Oct. 31, 1901. Serial No. 90,004. (No model.)

Claim.—1. In a device of the character described, the combination with the driving and driven members, and intermediate clutch mechanism, of a treadle disposed below the driving member and fulcrumed at its rear end, a retracting-spring provided with an eye at one end, a single strand passed through the eye of the retracting-spring and doubled upon itself, the two strands then formed being wound upon the driving member in the same direction, and a clamp mounted upon the treadle and adjustably retaining the extremities of said strand.

2. In a device of the character described, the combination with the driving and driven members, and intermediate clutch mechanism, of a treadle disposed below the driving member and fulcrumed at its rear end with its front end located in advance of the driving member, a retracting-spring secured directly beyond the rear end of the treadle and provided with an eye at one end, a single strand passed through the eye of the retracting-spring and doubled upon itself, the two strands then formed being wound upon the driving member in the same direction, and a clamp mounted on the treadle in advance of the driving member and adjustably retaining the extremities of the flexible piece.

3. In a device of the character described, the combination with a frame comprehending a transverse tie-rod, coaxial driving and driven

members, and intermediate clutch mechanism, of a treadle disposed below the driving member and having a fulcrum end and fulcrumed upon the tie-rod, a retracting-spring secured at one end to the tie-rod within the fork of the treadle and having an eye at its opposite end, a single flexible piece passed through the eye of the spring and doubled upon itself, the double strand being wound upon the driving member, and a clamp carried by the treadle in advance of the driving member and adjustably retaining the extremities of the flexible piece.

4. In a device of the character described, the combination with a shaft, and a wheel mounted thereon and provided with a clutch-disk having a flat annular side face, of a cylindrical driving member also mounted on the shaft and having at one end a clutch-disk opposed to the clutch-disk of the wheel, and formed with a series of tapering pockets having inclined bottom walls, clutch-balls located within the pockets and disposed against the flat annular face of the first-named clutch-disk, a treadle disposed below the driven member, a spring located at the rear end of the treadle, and a single flexible piece doubled upon itself and wound as a double strand upon the driving member, the doubled end of said piece being secured to the spring and the extremities of said piece having attachment to the treadle adjacent to the front and throat.

699,172. DELIVERY MECHANISM FOR PRINTING-PRESS. ALFRED J. HUGHES, New York, N. Y. Original application filed Aug. 1, 1901, Serial No. 71,204. Divided and this application filed Nov. 20, 1901. Serial No. 92,587. (No model.)

Claim.—1. In a printing-press, the combination with the bed, plates and inkling mechanism including the inkling-plate and roller-carrying arms; of a support fixed to the frame of the press in rear of the inkling-plate and having an upwardly and forwardly extending standard rising therefrom, a swinging delivery device movable over the inkling-plate toward and from the plates and provided with an automatic gripper to engage the printed sheets on the plates, a rock-shaft journaled in said support and carrying said delivery device, a crank-arm connected to the rock-shaft, a connection between said crank-arm and one of the roller-carrying arms of the inkling mechanism for swinging said delivery device, a receptacle for the printed sheets supported by said standard, and contact-pieces on the press-frame and receptacle for actuating the gripper to automatically engage and release the sheets, substantially in the manner described.

2. In a printing-press, a chute having a T-shaped slot forming the entrance thereto, combined with a delivery device movable through the body portion of the slot and adapted to draw the printed portion of the sheet through the cross portion of the slot, substantially as specified.

699,173. RAILWAY-RAIL. CLYDE E. HUGHES and JAMES W. HUGHES, Hamilton, Ohio. Filed Feb. 17, 1902. Serial No. 94,589. (No model.)

Claim.—1. A duplex railway-rail comprising an outer tread portion, an inner tread portion separated from the outer tread portion by a groove, and an inner guard portion separated from the inner tread portion by a groove.

2. A duplex railway-rail comprising an outer tread portion having a web and foot and inwardly-projecting flanges, an inner tread having a

web and inner foot and outwardly-projecting flange engaging the first-named flange, and bolts through the two webs.

3. A duplex railway-rail comprising an outer tread portion having a web and outer foot and beveled inner flange, an inner tread portion having a web and inner foot and inner guard and inner flange fitting the first-named flange, and bolts through the two webs.

4. In a railway-rail, the combination, substantially as set forth, of a web having a tread portion and foot-flange at one side and a pair of projecting flanges at the other side, a second web having a pair of side flanges adapted to engage the first-named flange, and bolts through the two webs.

5. In a railway-rail the combination, substantially as set forth, of a length of web having a tread portion and a foot-flange projecting from one of its sides and a pair of flanges projecting from its other side, a length of web disposed alongside the first-named web and breaking joint therewith and having a foot-flange at one side and a pair of flanges at the other side engaging the first-named flange, and bolts through the two webs.

699,174. METER-BOX CONNECTOR. JOHN J. HUGHES, Spring-Field, Ohio. Filed Aug. 31, 1901. Serial No. 71,202. (No model.)

Claim.—1. In an meter casing such as described, the combination with the meter having oppositely-extending spouts, of an inlet and outlet extending horizontally into said casing, adapted to form with said spouts a straight way through said casing to said meter, telescoping connecting devices and mechanism to positively move said devices for connecting and disconnecting said inlet and outlet with said spouts, substantially as specified.

2. In an meter casing such as described, the combination with the meter having the oppositely-extending spouts, of an inlet and outlet extending horizontally into said casing, having spouts extending from the lower ends thereof to receive said spouts when the meter is lowered into the casing, and adapted to form with said spouts a straight way, and means for connecting and disconnecting said inlet and outlet with said spouts, substantially as specified.

3. In an meter casing such as described, the combination with an inlet and outlet extending horizontally into said casing, having spouts extending from the lower ends thereof, of a meter having on each of its oppositely-extending spouts, a connection carrying a packing, said connection, when said meter is lowered into said casing, being adapted to be received into said spouts, and means, including a slip-joint, for connecting by pressure said inlet and outlet with the packing of said connection, substantially as specified.

4. The combination with the meter casing having the horizontal inlet and outlet extending into said casing, of a meter having oppositely-extending spouts, telescoping connecting devices and means transmitting a positive reciprocating motion to said telescoping connecting devices, for connecting and disconnecting said inlet and outlet with said spouts, substantially as specified.

5. The combination with the meter casing having the horizontal inlet and outlet, extending into said casing, and a meter with oppositely-extending spouts, of a vertically-disposed screw, a segment to engage said screw, having an arm at right angles thereto, and a sleeve pivotally connected to said arm, whereby upon the rotary movement of said screw, said sleeve will be given a longitudinal movement, substantially as and for the purpose specified.

6. The combination with the meter having the oppositely-extending spouts, and spouts extending beyond the ends of said spouts, having annular chambers therein, of packing in said chambers extending to the openings in said spouts, inlet and outlet pipes, and means for connecting by pressure said pipes with the packing of said spouts, substantially as specified.

699,175. APPARATUS FOR MAKING CORES. GEORGE J. HUGHES, Sydney, New South Wales, Australia. Filed Oct. 2, 1901. Serial No. 77,314. (No model.)

Claim.—1. In apparatus for making cores for cylindrical castings, in combination, a truck or traveler running on rails the said truck having means for carrying the cylindrical core-barrel, a fixed feed-hopper placed near the said means for carrying the core-barrel as described, a fixed revolving wire cylinder mounted to rotate in contact with the core-barrel means for lowering the pressure of the wire cylinder against the core-barrel, a trough below the wire cylinder and means for rotating the core barrel, and for causing the forward travel of the truck as herein specified.

2. In a machine of the class described, a support for a core-barrel, means for moving said support in the direction of the axis of the core-barrel and for rotating said core-barrel, a rotatable wire cylinder of less length than the core-barrel having its axis inclined to the axis of the core-barrel, means for pressing the wire cylinder against the core-barrel, a feed-hopper above the point of contact of the core-barrel and cylinder and a trough below the cylinder, substantially as described.

699,176. CATCH-BASE FOR SHEWERS. WILLIAM J. HUGHES, Albany, N. Y. Filed Sept. 4, 1902. Serial No. 93,857. (No model.)

Claim.—1. A catch-base for showers having its walls convex-concave in section and of greater radius than the diameter of the basin, flanges projecting from the vertical edges of said walls, means for securing the adjacent flanges of the adjoining walls together, and a tapering concrete reinforcement for said walls.

2. A catch-base for showers having its walls convex-concave in section and of greater radius than the diameter of the basin, flanges project-

ing from the vertical edges of said walls, means for covering the adjacent flanges of the adjoining walls together, a tapering concrete reinforcement for said walls, said basin being formed with an intake-opening, and a grated cover for said opening supported by said walls and concrete reinforcement.

2. A catch-basin for sewers having a surface intake-opening, a plurality of sedimentary vessels, each of a size to readily pass through said opening and having an aggregated sectional area greater than that of the opening, said vessels being arranged in juxtaposition below said opening to receive the flow therefrom and retain detachable articles, a screening vessel below and of greater sectional area than the combined area of the sedimentary vessels, and a valved outlet from said basin.

3. A catch-basin for sewers having a surface intake-opening, a sedimentary vessel below said opening and supported from the bottom of the basin, a screening vessel below the sedimentary vessel, and a valved trap below the screening vessel, said trap supporting the screening vessel.

4. A catch-basin for sewers having a surface intake-opening, a valved trap-outlet, a screening vessel above the trap and extending beyond the same on all sides, and a sedimentary vessel between the screening vessel and the intake-opening, said sedimentary vessel being of less sectional area than the screening vessel and supported from the bottom of the basin.

5. A catch-basin for sewers having a surface intake-opening, a valved trap-outlet centrally disposed near the bottom of the basin, a screening vessel supported by the trap and projecting beyond the same in all directions, and a sedimentary vessel of less sectional area than the screening vessel, said sedimentary vessel being removably supported by the bottom of the basin and arranged to receive all the flow from said intake-opening.

6. A catch-basin for sewers having a surface intake-opening, a valved trap-outlet, a sedimentary vessel below said intake-opening, posts rising from the bottom of the basin and supporting said sedimentary vessel, and a screening vessel intermediate the trap and sedimentary vessel and supported by the trap.

7. A catch-basin for sewers having a surface intake-opening comprising a grate, the bars of which are arranged in the direction of flow of water in the street-gutter and having their surface planes above the surface of the transverse and members of the grate, a valved trap-outlet from the basin, a sedimentary vessel below said intake-opening, posts rising from the bottom of the basin and provided with horizontal seats to support said sedimentary vessel, and a screening vessel between the sedimentary vessel and trap.

699,177. ELECTRIC CALL SYSTEM. FRANK E. HUGHES, Kans. Filed Apr. 12, 1901. Serial No. 64,086. (No model.)

Claim.—1. A call system including a main line and its battery, instruments each including an alarm, an electrically-operated switch for closing the circuit of the alarm, and a selecting device for closing the circuit of the switch, the selecting device being connected in series in the

main line and the switches being responsive to differently-timed electrical impulses in the main line.

2. A call system including a main line and its battery, instruments each including an alarm, an electrically-operated switch for closing the alarm-circuit, and including a series of electromagnets, and a selecting device having individual circuits for the separate magnets, contact-plates included therein and a contact-finger adapted to traverse the plates, the selecting device being included in series in the main line, and having different plates connected with the switch-magnets.

3. A call system including a main line and its battery, a plurality of selecting devices connected in the main line and each comprising a movable contact and a series of fixed contacts for successive engagement thereby, a signal-circuit of each selecting device including a signal and battery, a switch for each signal-circuit including sections movable into and out of series relation to close and open the signal-circuit, an electromagnet for actuating each switch-section, each magnet having one terminal connected with the movable contact of the selecting device through a source of electricity, and its opposite terminal connected with a fixed contact of the selecting device, the different selecting devices having different groups of fixed contacts thus connected.

4. A call system including a main line and its battery, a plurality of selecting devices connected in the main line and each comprising relatively fixed and movable contacts for engagement one by the other, a signal-circuit at each selecting device including a signal and source of electricity, a switch for each signal-circuit including sections movable into and out of co-operative relation to close and open the signal-circuit, an electromagnet for actuating each switch-section, each magnet having one terminal connected with the movable contact through a source of electricity and its opposite terminal connected with a fixed contact of the selecting device, means for holding the switch-sections in positions to close the signal-circuit, and releasing mechanism including an electromagnet connected between the movable contact and all of the fixed contacts that are not connected with the switch-magnets, the different selecting devices having different groups of fixed contacts connected with the magnets of their respective switches.

5. A call system including a main line and battery, a plurality of selecting devices connected in the main line and each including an annular series of fixed contacts and a rotatable contact adapted for movement against each of the contacts when correspondingly moved, an electromagnet for moving the hand against each contact when positioned adjacent thereto, said magnets being connected in series in the main line, means for rotating the hand, a signal-circuit at each selecting device including a signal and source of electricity, a switch for each signal-circuit including sections movable into and out of co-operative relation to close and open the signal-circuit, an electromagnet for moving each switch-section into closed position, each magnet having one terminal connected with the contact-finger of its selecting device through a source of electricity and its opposite terminal connected with a fixed contact thereof, means for holding the switch-sections in closed position, and releasing mechanism including an electromagnet connected between the contact-finger and the fixed contacts that are not connected with the switch-magnets, the selecting devices having different groups of fixed contacts connected with the switch-magnets.

699,178. ADVERTISING-SIGN. LITTLE J. HUYER, Cincinnati, Ohio. Filed Nov. 4, 1901. Serial No. 81,098. (No model.)

Claim.—In combination, the two curtains, a roller for each upon which they are mounted, an electric motor for communicating motion to the rollers, gear connections between the motor and the rollers and reversing mechanism for the motor comprising a screw-shaft T, a movable piece engaging the screw-shaft, a rotary disk P, a spring N connected at one end to the piece V, and at the other end to the disk, a series of clamps W carried by the disk, a series of tongues arranged to engage and be held by the clamps, a support for said tongues relatively fixed in relation to the disk, rods T' carried by the piece V, said rods being arranged to engage the ends on the disk to rotate the same and reverse the position of the disk and cause the engagement of the tongues and the other set of clamps and circuit connections controlled by the tongues and clamps, substantially as described.

699,179. ICE-CREAM CABINET. JOHN BURLAY, Little Falls, N. Y. Filed July 12, 1901. Serial No. 67,967. (No model.)

Claim.—An ice-cream cabinet, comprising a rectangular casing with an open front, a five-sided sheet-metal lining for the cavity of said casing, a block resting upon the bottom of the lining at the forward end thereof, an ice-cream receptacle slightly mounted in the space of said lining and resting upon the front block, a block depending from the bottom thereof at its rear adapted to rest upon the bottom of the lining and prevent the receptacle from being withdrawn entirely from the casing, a cover or door extending across the rear end of the receptacle and having inclined outer faces to contact the face of the opening of the cabinet, said surfaces being further provided with rolled or curved edges, a rectangular disk or plate held against the outer faces of the inclined surfaces by the rolled or curved edges to form a double-walled cover or door, and a handle carried by the disk.

699,180. UNIVERSAL JOINT. JULIUS JETTER, Winchester, Mass. Filed July 12, 1901. Serial No. 68,052. (No model.)

Claim.—1. A universal joint, having, in combination, coupling-heads, a block interposed between the coupling-heads, screws pivotedly connecting the block with the heads, and a pin arranged to engage the screws and prevent rotation thereof, substantially as described.

2. A universal joint, having, in combination, coupling-heads, a block interposed between the coupling-heads, conical-ended screws pivotedly connecting the block with the heads, and a pin arranged to engage the ends of the screws and prevent rotation thereof, substantially as described.

3. A universal joint, having, in combination, coupling-heads, a block interposed between the coupling-heads, four screws provided with grooved ends pivotedly connecting the block with the heads, and a pin arranged to engage the grooves in the ends of the screws and prevent rotation thereof, substantially as described.

4. A universal joint, having, in combination, forked coupling-heads, a block interposed between the coupling-heads provided with surfaces engaging the inner surfaces of the forks of the coupling-heads, four screws provided with grooved ends pivotedly connecting the block with the heads and a pin having a driving fit in a hole in the block at right angle to the plane in which the screws are located arranged to engage the grooves in the ends of the screws and prevent rotation thereof, substantially as described.

699,181. JUNCTION OR FUSE BOX. HENRIEY H. JENNISON, Utica, N. Y. Filed Dec. 26, 1901. Serial No. 67,617. (No model.)

Claim.—1. The combination in a fuse or junction box of the box or casing, an internal frame secured in the box above the bottom, a removable tablet supported within the said frame, entrance for electrical connections into said box below the tablet, fixed binding-posts on said frame electrically connected with the conductors, "bus-bars" and corresponding binding-posts on the removable tablet and removable frame, substantially as set forth.

2. The combination in a fuse or junction box of the casing, an internal frame secured to the side of the box above the bottom, a removable tablet supported within the frame, "bus-bars" and binding-posts arranged on said tablet, corresponding binding-posts arranged on said frame, Z-shaped connecting-plugs extending from the binding-posts through the line of separation between the frame and the tablet into the space beneath the tablet, entrance for electrical conductors into the space beneath the tablet and means for connecting the conductors to said Z-shaped connecting-plugs arranged beneath the tablet, substantially as set forth.

3. The combination in a fuse or junction box of a casing, a two-part tablet supported above the bottom of said casing, one of said parts being removably secured and the other part fixed in the casing, entrance into said casing for electric conductors between said tablet and bottom of casing, binding-posts on said fixed portion of tablet and corresponding binding-posts mounted on the removable portion of the tablet, electrical dis-

tributing connections mounted upon and connected with the binding-posts on said removable portion and fixed-portion connecting said two sets of binding-posts and spanning the line of separation between the fixed and removable portions of tablet, substantially as set forth.

699,182. OYSTER-TRIMMING MACHINE. EDWARD D. JOHNSON, New York, N. Y. Filed June 10, 1901. Serial No. 68,948. (No model.)

Claim.—1. In a machine of the class specified, the combination, with an endless conveyor and means for opening the same, of a revolving cutting device, a revolving clearing device and means for revolving the said clearing and cutting devices, both turning on the same axis, whereby they coast with the conveyor, the cutting device adapted to cut away a portion of the shell of a bivalve carried by the conveyor, and the clearing device adapted to clip and throw off the cut portion of the shell, substantially as shown and described.

2. In a machine of the class specified, the combination, with an endless conveyor having holding devices projecting therefrom, each holding device shaped for retaining a bivalve and having a flexible lining, and means for opening said conveyor, of a revolving cutting device and a revolving clearing device, both turning on the same axis, and means for revolving them, the cutting device and clearing device coasting with the conveyor, the cutting device adapted to cut away a portion of the shell of the bivalve carried by the conveyor, and the clearing device adapted to clip and clear away the cut portion of shell, substantially as shown and described.

3. In a machine of the class specified, the combination, with an end-

has conveyor having holding devices projecting therefrom, each holding device shaped for retaining a bivalve and having a flexible lining, and means for operating the same, and a flexible pressure-roller mounted on the frame for holding a bivalve in place on said conveyor while said bivalve is being clipped, of a revolvable cutting device and a revolvable clearing device, both turning on the same axis, and means for revolving them, the cutting device and clearing device coacting with the conveyor, the cutting device adapted to cut away a portion of the shell of a bivalve carried by the conveyor, and the clearing device adapted to clip and clear away the cut portion, substantially as shown and described.

699,183. HOT-AIR REGISTER. ALBION C. JONES, Baltimore, Md., assignor to The United States Register Company, Limited, a Corporation of Michigan. Filed May 13, 1901. Serial No. 69,998. (No model.)

Claim.—In a hot-air register, a casing, each end of which is adapted to be secured to a hot-air flue, and the upper portion of the front is open and notched at the top, a deflector within the casing provided with plates for fitting within the notches, a front cover to the front of the casing and adapted to hold the plates in place, the lower portion of which is open and the upper portion is provided with a screw-threaded guide, a member hinged in the opening of the front to swing outward, and a knob for engaging with and operating the deflector, the stem of said knob being screw-threaded and fitting within the guide, substantially as described.

699,184. DRAFT-EQUALIZER. JAMES JONES, Atlantic, Iowa. Filed Oct. 10, 1901. Serial No. 70,171. (No model.)

Claim.—1. The combination in a four-horse equalizer of the support C pivoted to the lever A, and adapted to be secured to an agricultural implement, the lever B pivoted to the lever A, and secured to the support C, and the lever A having a double-throw and a single-throw secured thereto, substantially as described.

2. The combination in a four-horse equalizer of the support C having one of its ends pivoted to and within the lever A, and adapted to be secured to an agricultural implement, the lever B which is pivoted to the lever A and plays within the same and which is secured between its ends to the support C, and the lever A having a slot for the reception of the support C and the lever B, substantially as described.

699,185. CHASING FOR WASHING-MACHINES. FREDERICK C. KAHNER, Chicago, Ill. Filed July 13, 1901. Serial No. 69,991. (No model.)

Claim.—The combination with a power-shaft, of a beveled gear, an oscillatory shaft suitably journaled, a gear on said shaft, a beveled gear

journaled to engage the first-named beveled gear, a shafted rack-bar pivotally connected to the last-named beveled gear and engaging the oscillatory shaft and the gear thereon, substantially as described.

699,186. COLLAPSIBLE BABY-CARRIAGE. ALBERT KATNER, Erie, Pa., assignor of one-half to Jacob Hammer, Erie, Pa. Filed Aug. 13, 1901. Serial No. 71,806. (No model.)

Claim.—1. In a collapsible baby-carriage, the combination of the axle having the two parts, A A, and joints a a', a forwardly-extending frame; a rod, G, connected with the forward end of the frame; and means for locking said rod with the axle to lock the axle in its open position.

2. In a collapsible baby-carriage, the combination with the axle having the parts A A, and joint a a'; the extension, A' A'; and joint, a'; the forwardly-extending frame jointed on the extension, A' A'; and means connected with the said frame for locking the axle in an open position.

3. In a collapsible baby-carriage, the combination of a jointed axle; a frame narrower at the front than at the rear; a joint between the axle and the frame sides and between said frame sides and the wheel-supporting device at the front of the carriage; and said wheel-supporting device.

4. In a collapsible baby-carriage, the combination of the axle, A A, having the joint, a a'; a tubular guide, A'; the extension, A' A'; the upright, C, on said extension; the upper and lower frame-pieces jointed on the upright; the fork, E; joints between said frame-pieces and the fork, E; and the rod, G, extending from the fork into the tubular guide for locking the axle in an open position.

5. In a collapsible baby-carriage, the combination of a jointed axle; uprights extending from said axle; a seat-frame secured to said uprights having joints with horizontal axes at its connection with the uprights; and a joint having a horizontal axis lengthwise of the carriage in the seat-frame to permit the folding of the seat-frame by a movement of the parts in a downward direction.

6. In a collapsible baby-carriage, the combination of a jointed axle; uprights extending from said axle; a seat-frame secured to said uprights, having joints with horizontal axes at its connection with the uprights; a joint having a horizontal axis lengthwise of the carriage in the seat-frame to permit the folding of the seat-frame by moving the parts in a downward direction; and means for locking the seat-frame in the upper position.

7. In a collapsible baby-carriage, the combination of a jointed axle; uprights extending from said axle; a seat-frame secured to said uprights having joints with horizontal axes at its connection with the uprights; a joint having a horizontal axis lengthwise of the carriage in the seat-frame to permit the folding of the seat-frame by moving the parts in a downward direction; a rod extending from the seat-frame to the axle; and means for locking said rod with the axle.

8. In a collapsible baby-carriage, the combination of the jointed axle, A A, with the extension, A'; a frame narrower at the front than at the axle; a front fork connected with the forward end of said frame; joints between the fork and the frame and between the axle and the frame; and means for telescoping the frame to contract the length of the vehicle.

9. In a collapsible baby-carriage, the combination of the axle having the parts, A A, with the joint, a a'; the joint, a' a' and extension, A' A'; the upright, C C'; the frame-pieces, D D', jointed on the uprights, C; the extension frame-pieces, D' D', arranged to telescope the frame-pieces, D; the front fork and joint between the front fork and frame-pieces, D' D'; the upper frame-piece, D', extending from the upright, C, to the frame-pieces, D; telescoping means between the frame-pieces, D' and D'; the joint, a', between the frame portion, D', and the fork; the seat-frame, H, jointed to the upper end of the upright, C, and having joints permitting of its folding in a downward direction; and the rod, W, for supporting the seat-frame in an open position.

699,187. MEANS FOR CONNECTING DYNAMOS WITH TRACKS OF RAILWAY-CARS. PETER KENNEDY, Brooklyn, N. Y., assignor to the Consolidated Railway Electric Lighting and Equipment Company, a Corporation of New Jersey. Filed Aug. 17, 1901. Serial No. 72,573. (No model.)

Claim.—1. The combination with a railroad-truck, a driving-pulley fast on an axle of the truck, a dynamo carried by the truck, and a driving-belt from the pulley on the axle to the dynamo-pulley, of a support for the dynamo outside of the truck composed of bars fast at their inward ends to an inward cross-beam of the truck, extended outward over an outward beam of the truck and beyond the latter and back to the truck, means for attaching the said bars to the truck, and means for releasing the dynamo in the cage, as described.

2. The combination with a railroad-truck, a driving-pulley fast on an axle of the truck, a dynamo carried by the truck, and a driving-belt from the pulley on the axle to the dynamo-pulley, of a support for the dynamo outside of the truck composed of bars fast at their inward ends to an inward cross-beam of the truck, extended outward over an outward beam of the truck and beyond the latter, then shaped to form a cage for the dynamo and thence inward and back to the truck, means for securing said bars to the truck, means extended from the inward side of the cage to the inward ends of the bars, and means for securing the respective ends of said beams to the adjacent portions of the bars, as described.

3. The combination with a railroad-truck, a driving-pulley fast on an axle of the truck, a dynamo carried by the truck and a belt from the pulley on the axle to the dynamo-pulley, and a support for the dynamo composed of bars extended from an inward cross-beam of the truck outward over an outward cross-beam of the same and beyond the end of the truck, then bent to a shape requisite to form a cage for the dynamo, and thence inward back to the truck, of a pivotal support for the dynamo at the bottom of the cage, and means for elastically pressing the dynamo in a direction against the strain exerted by the tension of the belt, as described.

4. The combination with a railroad-truck, a driving-pulley fast on an axle of the truck, a dynamo carried by the truck, and a belt from the pulley on the axle to the dynamo-pulley, of a support for the dynamo outside of the truck composed of bars extended outward from an inward cross-beam of the truck over an outward cross-beam through and beyond the

truck and then bent to the shape requisite to form a cage for the dynamo, and then back to the truck, of a transverse shaft for pivotally supporting the dynamo at the bottom of the cage, bearings for said shaft, a slide at the top of the cage having one end pivoted to the top of the dynamo, and a spring provided to the slide to press the same and consequently the dynamo in a direction against the strain exerted by the tension of the driving-belt, as described.

5. The combination with a railroad-truck, a driving-pulley fast on an axle of the truck, a dynamo carried by the truck, and a belt from the pulley on the axle to the dynamo-pulley, of a support for the dynamo outside of the truck composed of bars extended outward from an inward cross-beam of the truck over an outward cross-beam thereof and beyond the truck and thence bent to the shape requisite to form a cage for the dynamo, and then back to the truck, of a transverse shaft for pivotally supporting the dynamo at the bottom of the cage, bearings for said shaft, a slide at the top of the cage having a strap thereon and having one end pivotally connected with the top of the dynamo, a guide for the opposite end of the slide, and a spring applied between the guide and the strap on the slide to press the latter and consequently the dynamo in a direction opposite the strain exerted by the tension of the belt, as described.

6. The combination with a railroad-truck, a driving-pulley fast on an axle of the truck, a dynamo carried by the truck, and a belt from the pulley on the axle to the dynamo-pulley, of a support for the dynamo composed of bars each of which at its inward end is shoulderbed at its upper side to abut against the bottom portion of an inward cross-beam of the truck to which said end of the bar is bolted and also shoulderbed at its outer side to become the abutting end of a beam, each bar extended over an outward cross-beam of the truck, then outward beyond the end of the truck and then bent to the shape requisite to form a cage for the dynamo and then inward to the outer side of said outward cross-beam, bolts extended through said cross-beam and through the bars above and below the same to secure the bars to said beam, beams extended from the inward side of the cage to the shoulders on the outer sides of the bars, and bolted to the said bars a transverse shaft at the bottom of the cage to pivotally support the dynamo from below, a slide at the top of the cage having a strap thereon and at one end pivotally connected with the top of the dynamo, a guide through which is passed the opposite end of the slide, and a spring between the guide and the strap on the slide to press the latter and consequently the dynamo in a direction opposite the strain exerted by the tension of the belt, as described.

699,188. WATER METER AND RECORDER. WALTER C. KEMP, county of Middlesex, England. Filed Nov. 4, 1901. Serial No. 71,157. (No model.)

Claim.—1. The combination of a water-main, a contraction thereon, a mercury-chamber, a float moving therein, two pipes conveying pressure from the contracted and uncontracted portions of the main to the float and the mercury, a spindle passing out from the mercury-chamber and turned by the movement of the float, a recording-drum, a pen bear-

MAY 6, 1902.

ing against the drum, integrating mechanism located within the drum, means operated by the spindle for actuating the pen and the integrating mechanism, means for driving the drum and the integrating mechanism, and a register operated by the integrating mechanism.

2. The combination of a water-main, a contraction therein, a mercury-chamber, a float moving therein, two pipes conveying pressure from the contracted and uncontracted portions of the main to the float and the mercury, a cock in each pipe, means for putting the two pipes in communication, a spindle passing out from the mercury-chamber and turned by the movement of the float, a recording-drum, a pen bearing against the drum, integrating mechanism located within the drum, means operated by the spindle for actuating the pen and the integrating mechanism, means for driving the drum and the integrating mechanism, and a register operated by the integrating mechanism.

3. The combination of a water-main, a contraction therein, a mercury-chamber, a float moving therein, two pipes conveying pressure from the contracted and uncontracted portions of the main to the float and the mercury, a spindle passing out from the mercury-chamber, parallel-motion links connecting the float and the spindle, a recording-drum, a pen bearing against the drum, integrating mechanism located within the drum, means operated by the spindle for actuating the pen and the integrating mechanism, means for driving the drum and the integrating mechanism, and a register operated by the integrating mechanism.

4. The combination of a water-main, a contraction therein, a mercury-chamber, a float moving therein, two pipes conveying pressure from the contracted and uncontracted portions of the main to the float and the mercury, a spindle passing out from the mercury-chamber and turned by the movement of the float, a recording-drum, a pen-bearing against the drum, a rock-shaft connected to the spindle, parallel-motion links connecting the pen with the rock-shaft, integrating mechanism located within the drum, means operated by the spindle for actuating the integrating mechanism, means for driving the drum and the integrating mechanism, and a register operated by the integrating mechanism.

5. The combination of a water-main, a contraction therein, a mercury-chamber, a float moving therein, two pipes conveying pressure from the contracted and uncontracted portions of the main to the float and the mercury, a spindle passing out from the mercury-chamber, parallel-motion links connecting the float and the spindle, a recording-drum, a pen bearing against the drum, a rock-shaft connected to the spindle, parallel-motion links connecting the pen with the rock-shaft, integrating mechanism located within the drum, means operated by the spindle for actuating the integrating mechanism, means for driving the drum and the integrating mechanism, and a register operated by the integrating mechanism.

6. The combination of a water-main, a contraction therein, a mercury-chamber, a float moving therein, two pipes conveying pressure from the contracted and uncontracted portions of the main to the float and the mercury, a spindle passing out from the mercury-chamber and turned by the movement of the float, a recording-drum, a pen bearing against the drum, means operated by the spindle for actuating the pen, means for driving the drum, a shaft rocked by the movement of the float, a pivoted arm rocking with the shaft, a wheel carried by the arm, an integrating-disk on which the wheel runs, means for constantly rotating the disk, a counting-train, and means operated by the movement of the wheel for actuating the counting-train.

7. The combination of a water-main, a contraction therein, a mercury-chamber, a float moving therein, two pipes conveying pressure from the contracted and uncontracted portions of the main to the float and the mercury, a spindle passing out from the mercury-chamber and turned by the movement of the float, a recording-drum, a pen bearing against the drum, means operated by the spindle for actuating the pen, means for driving the drum, a shaft rocked by the movement of the float, a pivoted arm rocking with the shaft, a wheel carried by the arm, an integrating-disk on which the wheel runs, means for constantly rotating the disk, a pivoted frame, a spring pulling the frame in one direction, a shed on the pivoted arm moving the frame against the spring, a bell-crank turned by the frame, a constantly-rotating toothed wheel, a pivoted spindle carried by the bell-crank, a pinion on this spindle meshing with the toothed wheel, a counting-train, and means for actuating the counting-train from the pivoted spindle.

8. The combination of a water-main, a contraction therein, a mercury-chamber, a float moving therein, two pipes conveying pressure from the contracted and uncontracted portions of the main to the float and the mercury, a spindle passing out from the mercury-chamber and turned by the movement of the float, a recording-drum, rollers supporting the drum, a rack of teeth on the lower edge of the drum, a pair of pinions gearing with the rack, a pair of shafts fast with the pinions, bevel-gear driving the shafts, a pen bearing against the drum, integrating mechanism located within the drum, means operated by the spindle for actuating the pen and the integrating mechanism, a clock driving the bevel-gear and the integrating mechanism, and a register operated by the integrating mechanism.

699,189. SWING. JAMES A. KERR, Morton, Pa. Filed Sept. 26, 1900. Serial No. 31,282. (No model.)

Claim.—1. A swing having a single rigid suspending-bar of elongated form provided with an upper eye, means held by said bar for supporting an occupant of the swing, and a chain secured to said eye and having a hook at its free end for engagement with a portion thereof.

2. A swing comprising a single suspending-bar and a cage removably suspended from the lower extremity thereof and consisting of depending rods attached to a seat-board, an arched hanger removably secured in the upper portions of the said rods and formed with an upper loop, and a tie-plate for removably connecting the upper ends of the rods and having a central opening through which the hanger-loop extends.

3. A swing comprising an elongated suspending-bar having an upper flexible fastening means provided with a terminal hook to engage a portion of said means when the latter is disposed around a support, and means held by said bar for supporting an occupant of the swing.

4. A swing comprising an elongated rigid suspending-bar made in two parts adjustably connected and having an upper flexible member provided with a terminal hook to engage a portion of said member when the latter is disposed around a support, and means held by said bar for supporting an occupant of the swing.

5. A swing comprising an elongated rigid suspending-bar having adjustable means, a flexible member connected to the upper portion of the bar and provided with a terminal hook to engage a portion of said member when the latter is disposed around a support, and means held by said bar for supporting an occupant of the swing.

699,190. SPREADER FOR PAPER-MAKING MACHINES. WALTER C. KIRKLAND, Moberly, Mo. Filed Sept. 30, 1901. Serial No. 77,108. (No model.)

MAY 6, 1902.

U. S. PATENT OFFICE.

1199

Claim.—A spreader for portable wire-fence-making machines comprising two plates held separated, each having a slot and four projecting lugs, two groove-faced rollers located between the plates and having transverse slots in the slots the rollers being held in contact by the pressure of the fence-wire.

699,191. LUBRICATOR. OLIVER C. KIPP, Keshels, Ill. Filed May 24, 1901. Serial No. 61,157. (No model.)

Claim.—1. In a lubricator, the combination of an oil-reservoir, a cylinder supported by the reservoir, the lower end of the cylinder provided with an opening extending radially forming a communication between the cylinder and reservoir and a discharge-opening, a piston located within the cylinder and provided with a longitudinal slot which is located to one side of the center of the piston, a shaft, an eccentric supported by the shaft and located diagonally to the longitudinal direction of the shaft, and a connection between the eccentric and piston.

2. In a lubricator, the combination of an oil-reservoir, a cylinder, a piston for the cylinder, a shaft, a connection between the shaft and piston, a ratchet-wheel secured to the shaft, an arm supported by the shaft, a lever supported by the arm, a dog supported by the arm, and a spring connection between the dog and lever.

699,192. MACHINES FOR FOLDING CLOTH BLANKS. CHASLES H. KRAFT, Paterson, N. J. Filed Jan. 17, 1902. Serial No. 99,188. (No model.)

Claim.—1. In a folding or other substantially similar machine, the combination, with a support, of another and movable support, coasting forming means, a part of said means being mounted on said first-named support and the rest on the movable support, and means, controlled from the portion of said forming means on said first-named support, for locking the movable support in a retracted position, substantially as described.

2. In a folding or other substantially similar machine, the combination, with a support, of another and movable support, coasting forming device, a part of said device being mounted on said first-named support and the rest on the movable support, means for actuating the forming device on said first-named support, and means, controlled from said actuating means, for locking said movable support in a retracted position, substantially as described.

3. In a folding or other substantially similar machine, the combination, with a support, of another and fixed support, coasting forming device, a part of said device being mounted on said first-named support and the rest on the fixed support, means for actuating the forming device on said first-named support, a hook on said fixed support, and a movable locking-detent adapted to engage said hook, said detent being controlled from said actuating means, substantially as described.

4. In a folding or other substantially similar machine, the combination, with a bed, of a fulcrumed support, movable folding-plates mounted on said bed, a contrivance die carried by said support and adapted to contact with said folding-plates, means for actuating said folding-plates, a tappet movable with a part of said actuating means, and a movable detent, said detent being adapted to engage said support in its elevated position and said tappet being adapted to move said detent out of operative position when said folding-plates are retracted, substantially as described.

5. In a folding or other similar machine, the combination of a fulcrumed arm, a tool carried by said arm and comprising a movable part, a guide projecting from the fulcrum of said arm, a counterbalancing traveler arranged to move on said guide, and operative connecting means between the traveler and the movable part of said tool, substantially as described.

6. In a folding or other similar machine, the combination of a fulcrumed arm, a tool carried by said arm, a rotary handle for said tool, a guide projecting from the fulcrum of said arm, a counterbalancing traveler arranged to move on said guide, and operative connecting means between said traveler and the handle, substantially as described.

7. In a folding or other similar machine, the combination of a fulcrumed arm, a contrivance die carried by said arm, a rotary handle for said contrivance die, a guide projecting from the fulcrum of said arm, a counterbalancing traveler arranged to move on said guide, operative connecting means between said traveler and the handle, and a spring controlling said traveler, substantially as described.

8. In a folding or other similar machine, the combination of a fulcrumed arm having a guide, a movable part carried by said arm, means, comprising another movable part arranged on said guide, for turning said arm on its fulcrum, and operative connecting means between said parts, substantially as described.

9. In a folding or other similar machine, the combination of a fulcrumed arm, a movable part carried by said arm, a guide projecting from the fulcrum of said arm, a movable counterbalancing device arranged on the guide and operative connecting means between said movable part and said counterbalancing device, substantially as described.

10. In a contrivance die, the combination of die-plates arranged to move in a common plane into close proximity to each other and having projections extending from each of said plates toward the other, the projections of each plate being arranged out of the plane, and out of opposition to the projections, of the other plate, and a slotted guiding part receiving said projections, substantially as described.

11. In a contrivance die, the combination of die-plates arranged to move in a common plane and into close proximity to each other, the adjoining portions of said plates being cut away to form alternating spaces and projections, and the projections of each plate being arranged out of the plane, and opposed to the spaces, of the other plate, and a slotted guiding part receiving said projections, substantially as described.

12. In a contrivance die, the combination of die-plates arranged to move in a common plane and into close proximity to each other, the adjoining portions of said plates being cut away to form alternating spaces and projections, and the projections of each plate being arranged out of the plane, and opposed to the spaces, of the other plate, a slotted guiding part receiving said projections, a support carrying said guiding part, and sliding plates engaging the projections of said adapted to actuate said die-plates and guided in said guide-plates, substantially as described.

13. In a contrivance die, the combination of die-plates arranged to move in a common plane into close proximity to each other and having projections extending from each of said plates toward the other, the projections of each plate being arranged out of the plane, and out of opposition to the projections, of the other plate, and means, engaging said projections, for guiding said plates, substantially as described.

699,193. DEVICES FOR CLEANING AND RUBBING COLLECTORS OF ELECTRIC MOTORS AND DYNAMO-MACHINES. WILLIAM KIRBY, Berlin, Germany. Filed Feb. 11, 1902. Serial No. 98,857. (No model.)

Claim.—1. The combination, in a device for rubbing and cleaning collectors of electric motors and dynamo-machines of a rubbing-block having its under face curved corresponding to the cylindrical face of the collector with a cavity for collecting the dust rubbed off from the collector and with an elastic means sliding upon the collector for cleaning the same.

2. In a device for rubbing and cleaning collectors of electric motors and dynamo-machines the combination of a rubbing-block having its under surface curved with a strip of emery-paper tied over the under sur-

face of the block, a cavity in the rear part of the block, a box fitted in the cavity for the entrance of dust and lined with soft material for retaining the dust, an elastic means at the rear part of the box, sliding upon the collector and keeping the same clean, and a brush at the rear part of the block for removing any dust retained upon the collector.

699,194. DUST-COLLECTOR. JOHN E. LANE and EDWIN R. WHITMAN, Jackson, Mich., assignors to Herman-Whitman Company, Jackson, Mich., a Corporation of Michigan. Filed June 5, 1901. Serial No. 11,354. (No model.)

Claim.—1. In a dust-collector, a rotary filter comprising a circular series of radially-extending filter-sections, each section consisting of a flattened fabric-tube open at its inner end, a pair of spaced bars to which the edges of the mouth of said tube are attached, opposite and brackets to which said bars are secured, a yielding frame for supporting the outer end of the tube secured to said brackets and annular flanges covering said brackets in fixed relation to each other with the spaced bars of adjacent sections pressed together to form a substantially air-tight joint.

2. In a dust-collector, a filter-section comprising a flattened tube of fabric closed at one end and open at the other, an external spring-frame for supporting said tube, and placing a tension thereon lengthwise of said tube, and rods within said tube at opposite edges thereof adapted to hold the same from drawing inward and permitting of the inward yielding of said spring-frame at the center.

3. In a dust-collector, a filter-section comprising a flattened tube of fabric closed at one end and open at the other, an external spring supporting-frame for said tube having apertured bars to which the edges of the opposite ends of said tube are secured, and lining-plates secured to said bars and covering the fabric adjacent thereto for the purpose described.

4. In a dust-collector, a filter-section comprising a flattened tube of fabric closed at one end and open at the other, an external spring supporting-frame for said fabric having separated longitudinally-grooved bars adjacent to the open end of said tube, rods secured in loops in said fabric engaging in the grooves in said bars and plates secured to said bars covering the fabric on the inner faces of said bars and holding said rods in engagement with said grooves.

5. In a dust-collector, the combination with a rotary drum having annular end flanges and stationary heads, of a packing between said annular flanges and heads comprising a flexible flange of packing material, a split ring having slitted blocks at the end thereof, and a bow-spring for adjustably engaging with the slits in said ring whereby the latter will clamp said flexible flange to said annular flange.

699,195. RAIL AND BRACKET CONNECTION. JOHN E. LAMM, Stirling, Ill., assignor of one-half to Edwin F. Lawrence, Stirling, Ill. Filed Feb. 14, 1902. Serial No. 94,931. (No model.)

Claim.—1. A rail and bracket connection, comprising a bracket and formed with a socket-recess at one side adapted for engagement with the web of the rail, a rail formed with an arifice corresponding with the end of the bracket and adapted to receive said bracket end, engagement of the rail and the socket-recess being had by an independent longitudinal adjustment of one of said parts, and means for locking the parts at such longitudinal adjustment, substantially as set forth.

2. A rail and bracket connection, comprising a bracket end formed with a socket-recess at one side adapted for engagement with the web of the rail, a rail formed with an arifice corresponding with the end of the bracket and adapted to receive said bracket end, engagement of the rail and the socket-recess being had by an independent longitudinal adjustment of one of said parts, and means for locking the parts at such longitudinal adjustment, the same comprising a filling-piece inserted in the rail-arifice at the end of the same opposite to that at which the socket-recess has engagement, substantially as set forth.

3. A rail and bracket connection, comprising a bracket end formed with a socket-recess at one side adapted for engagement with the web of the rail, a rail formed with an arifice corresponding with the end of the bracket and adapted to receive said bracket end, engagement of the rail and the socket-recess being had by an independent longitudinal adjustment of one of said parts, and means for locking the parts at such longitudinal adjustment, the same comprising a filling-piece or tongue formed integral with the rail-web and adapted for engagement with the side of the bracket opposite to the side in which the socket-recess is formed, substantially as set forth.

4. A rail and bracket connection, comprising a bracket end formed with a socket-recess at one side adapted for engagement with the web of the rail, a rail having a crucial form and provided with an arifice immediately beneath the horizontal web of such rail and adapted to receive the engaging end of the bracket, engagement of the rail and the socket-recess being had by an independent longitudinal adjustment of one of said parts, and means for locking the parts at such longitudinal adjustment, substantially as set forth.

699,196. ELECTRIC ARC LAMP. ALBERT LAMM, New Bedford, Mass. Filed Dec. 4, 1902. Serial No. 94,941. (No model.)

Claim.—1. An arc-lamp having its lower carbon holder supported by a multiplicity of filamentary conductors distributed around the arc.

2. An arc-lamp having its lower carbon supported by a network of thin wires forming a curved-bed for the negative electrode.

3. An arc-lamp having its lower carbon suspended by a network of wires in circuit with the lamp and terminating in metal contacts to facilitate connection and disconnection with the lamp parts.

4. The combination with a lamp operated by electricity, of a multiplicity of filamentary conductors carrying a current to an electrode of said lamp.

5. The combination with a lamp operated by electricity, of a network of wires supporting the lower carbon and carrying current thereto.

6. In an electric arc lamp, an incandescent globe suspended by a network of wires including the same, an electrical connection from said wires to a terminal of the circuit, and an electrical connection from said wires to an electrode of the lamp, whereby the network of wires carries current to the lamp and at the same time mechanically supports the incandescent globe.

7. In an electric arc lamp the combination with an incandescent globe, of a series of filamentary conductors including and supporting the globe, and adapted to carry current to the negative electrode, said filamentary conductors having a diameter less than the electric arc, whereby the incandescence from the arc is not obscured by the conductors and cast as shadow.

8. In an electric arc lamp the combination with an incandescent globe, of a network of conducting-wires for the lower carbon of such a diameter that practically no shadows are cast by them from the light of the lamp.

699,197. AUTOMATIC SWITCH. FRANK S. LOWE, Baltimore, Md. Filed Feb. 26, 1902. Serial No. 94,942. (No model.)

Claim.—1. In an automatic switch, the combination with a main rail, and a switch-point, of a crank-shaft extending through said rail and switch-point, and formed with a worm working through a slot in the switch-point, and a gear-wheel interposed between the main rail and switch-point, and adapted to be raised and lowered by the movement of the crank-shaft.

2. In an automatic switch, the combination with a main rail, and a switch-point, of a crank-shaft extending through said rail and switch-point, and formed with a worm working through a slot in the switch-point, a beveled gear-wheel interposed between the main rail and the switch-point, and having its two ends oppositely beveled, and a connection between said crank-shaft and gear-wheel to raise and lower the latter through the movement of the crank-shaft.

3. In an automatic switch, the combination with a main rail and a switch-point, of a crank-shaft extending through said rail and switch-point, and formed with a worm working through a slot in the switch-point, a gear-wheel located between the main rail and switch-point pivotally secured at one end and oppositely beveled on the upper surface of its free end, and a keeper depending from the gear-wheel through which the crank of the shaft extends.

699,198. BOTTLE-STOPPER. GEORGE LEFFMANN, Brooklyn, N. Y., assignor of one-half to Charles L. Curtis, Brooklyn, N. Y. Filed Dec. 23, 1902. Serial No. 94,943. (No model.)

Claim.—1. The combination with a bottle provided with an inwardly-projecting beveled lip at the mouth thereof, a shoulder within the mouth and below the lip and a notch in the bottle-mouth with a free vertical opening, of a stopper seated on the shoulder, and a locking-wire ring fitted between the lip and the top of the stopper, one end of the wire forming the ring being bent outwardly and laid through the notch, whereby the end of the wire can be fitted vertically through the notch and the ring adjusting the end secured inwardly by the bevel of the lip when the end is fitted, substantially as described.

2. The combination with a bottle provided with an inwardly-projecting beveled lip at the mouth thereof, a shoulder within the mouth and below the lip and a notch in the bottle-mouth with a free vertical opening, of a stopper seated on the shoulder, and a locking-wire ring fitted between the lip and the top of the stopper, one end of the wire forming the ring being bent outwardly and laid through the notch, whereby the end of the wire can be fitted vertically through the notch and the ring adjusting the end secured inwardly by the bevel of the lip when the end is fitted, and the opposite end of the ring being separated from the body of the ring by an interval whereby the diameter of the ring may be reduced to permit its ready disengagement from its locking position, substantially as described.

3. The combination with a bottle, provided with an inwardly-projecting lip at the mouth thereof, of a stopper, composed of a sealing-disk

and a superimposed metal cover-disk fitting the mouth of the bottle, the metal cover-disk having tongues projecting therefrom at intervals on its periphery, and a locking-wire ring fitted between the lip and the cover-disk, the stopper and held beneath the tongues of the latter, the ends of the wire not being joined into a ring, and a space being left between one end of the wire and the opposite part of the ring, whereby the diameter of the ring may be reduced to permit its ready disengagement from its locked position, substantially as described.

699,199. GASKET AND SEAL FOR HYDROCARBON-LIQUID CONTAINERS. PHILIP J. LOWMEYER, Washington, D. C. Filed Apr. 26, 1901. Serial No. 94,944. (No model.)

Claim.—1. A container having an opening formed with a gasket-seat, a gasket-holder having an annular depending flange of less diameter than the outer wall of said seat and of greater diameter than the inner wall of said seat, a gasket having its edges and upper surface locked by said holder, and a cushioning-cap removably connected to said gasket-seat and designed to clamp the gasket to its seat, substantially as described.

2. The combination with a container having an exteriorly-threaded nipple formed with a flaring gasket-seat; of a gasket-holder provided with a downwardly-extending surrounding flange to engage said seat, a gasket surrounded by said flange and resting upon said seat, and a screw-cap for engaging said nipple and forcing the gasket to its seat, substantially as specified.

3. The combination with a container having an exteriorly-threaded nipple formed with a gasket-seat; of a gasket-holder having a surrounding depending flange and formed with a central depression, said flange adapted to engage said seat, a gasket surrounded by said flange and resting upon said seat, and a screw-cap for engaging said nipple and forcing the gasket to its seat, substantially as set forth.

4. In combination with a liquid-hydrocarbon tank or other vessel having an opening, and having for the purpose of a closure thereof, the exteriorly-threaded nipple, the interiorly-threaded screw-cap, the gasket and the beveled or conical gasket-seat, all in combination as heretofore described for the use and purpose herein mentioned.

699,200. GASKET-SEALING. GEORGE A. LAWRENCE, Eastland, Ind. Filed Aug. 12, 1902. Serial No. 94,945. (No model.)

Claim.—1. The combination of a seal-dropping element having a primary and a secondary seal-opening, with means to open and close said secondary seal-opening to render the same effective or ineffective at will, substantially as described.

2. The combination of a seal-dropping element having a primary seal-opening and a secondary seal-opening at different distances from the center thereof, and means to cover and uncover said secondary seal-opening at will, substantially as described.

3. The combination of a seal-dropping element having primary and secondary seal-openings to render the same effective or ineffective at will, substantially as described.

4. The combination of a seal-dropping element having primary and secondary seal-openings, a cut-off for said primary and secondary seal-openings and a valve to cover and uncover said secondary seal-openings to render the same effective or ineffective at will, substantially as described.

5. The combination of a ring-gear, a seal-disk rotatably therewith and detachably connected thereto, said seal-disk having a primary seal-opening and a secondary seal-opening at different distances from the cen-

ter thereof, a cut-off, and a valve, to cover and uncover said secondary seed-opening at will, substantially as described.

6. The combination of a revolvable seed-dropping element having a primary seed-opening and a secondary seed-opening at different distances from the center thereof, a cut-off, a valve, pivotally mounted on the center of said seed-dropping element, and means to operate said valve, to cover or uncover said secondary seed-opening at will, substantially as described.

699,201. CATTLE-TIE AND STANCHION. DE WITT C. MARSH, Leyden, N. Y. Filed Mar. 16, 1901. Serial No. 51,451. (No model.)

Claim.—1. In a stanchion, a pair of stanchion-bars pivoted at their lower ends, mounted to swing into and out of their vertical positions, a pair of horizontal sliding rails mounted to be operated in opposite directions, each sliding rail being provided with a gear-wheel secured thereto and a pivoted gear-wheel mounted between the gear-wheels and meshing into the same, and pivoted swinging levers or latches alternately mounted on the horizontal movable rails to engage the ends of the pivoted stanchion-bars, combined for the purpose stated.

2. In a stanchion, the combination of a series of pairs of stanchion-bars, pivoted at their lower ends, their upper free ends arranged to swing to and from vertical positions, a pair of horizontal sliding rails located on opposite sides of the stanchion-bars and mounted to be operated in opposite directions, a series of pivoted levers mounted alternately on the horizontal sliding rails to engage the free ends of the pivoted stanchion-bars for moving them into and out of vertical positions and means substantially as set forth for moving the horizontal rails in opposite directions, whereby a series of animals can be secured in the stalls and illustrated in one operation, substantially as set forth.

3. In a stanchion, a succession of pairs of standards, wider at the base than at the top, link connections secured to the standards, one on each side of the space between the standards and united at their lower ends, and a chain or other fastening device provided with means for surrounding the neck of the animal, in combination with pivotally-movable stanchion-bars, substantially as set forth for the purpose stated.

4. In a stanchion, pairs of standards, substantially as shown, secured in the frame of the stall, for permitting the neck and head of the animal to be inserted between the standards, a pair of connecting-rods with one end of each pivoted to the standard on each side of the opening and connected at the center, with means for securing the same to the neck of the animal, in combination with movable stanchion-bars, substantially as set forth for the purpose stated.

5. In a stanchion, a frame comprising upper and lower rails with upright standards between them, stanchion-bars pivotally attached to the lower rail, reciprocally-moving sliding rails, means for detachably connecting the sliding rails and the stanchion-bars, means for oppositely reciprocating the sliding rails, in combination, substantially as set forth.

6. In a stanchion, upright standards, rails connecting the standards at the top and bottom, stanchion-bars pivotally secured on one of the rails, means comprising reciprocally-moving rails for turning on its bearing each stanchion-bar, in combination, substantially as set forth.

7. In a stanchion and cattle-tie, a frame comprising top and bottom rails, standards suitably attached to the rails, chain-rods attached to the standards provided with links and here for securing the cattle, in combination, substantially as set forth.

8. In a stanchion or cattle-tie, upright standards, rails connecting the same at the top and bottom, chain-rods secured to the upright standards by swivels, swivels attached to each chain-rod, a link connecting the free ends of the chain-rods in the space between the standards, suitable means for securing the cattle depending from the link, in combination, substantially as set forth.

9. In a stanchion or cattle-tie, successive pairs of standards separated to allow the animal to withdraw the head freely from between the standards, rods and chains suitably secured at the one end to the standards one on each side of the opening, said rods and chains being connected at their adjoining ends with means for securing the chains and rods to the animal, in combination, substantially as set forth.

10. In a stanchion and cattle-tie, standards rigidly secured to the top and bottom, stanchion-bars pivotally attached to the bottom rail with openings between wide enough to allow the animal's head and neck to pass through between the stanchion-bars at will, rods and chains pivoted at the one end to the standards between the top and bottom rails and on the stall side of the standards, one on each side of the opening, said rods and chains being connected together at the center, in combination with means for securing the same to the neck of the animal whereby the animal is free to withdraw its head, but is prevented from working up and through the manger side by rods and chains coming in contact with the upright standards or stanchion-bars, substantially as set forth for the purpose stated.

11. In a stanchion and cattle-tie, standards rigidly secured to the top and bottom, rods and chains pivoted at one end to the standards between the top and bottom rails on the stall side of the standards, one on each side of the opening, said rods and chains being connected at the center, in combination with means for securing the same to the neck of the animal, the chains and rods and neck connections being adjusted to permit the animal to withdraw its head and to prevent it from crowding into the manger by the rods and chains coming in contact with the upright standards or bars, substantially as set forth for the purpose stated.

12. In a stanchion, a frame comprising top and bottom rails and standards suitably fixed to the top and bottom rails, chain-rods attached to the standards and having yielding connections and provided with means for securing the cattle by yielding fastenings, in combination, substantially as set forth.

13. In a cattle-tie or stanchion, a rigid frame having standards secured therein, stanchion-bars pivotally secured in the base of the frame, chain-and-rod connections secured to the standards and connected at their other end with neck-fastenings for the cattle whereby are provided yielding fastenings, sliding rails adapted to be moved respectively, detachable connections between the sliding rails and the stanchion-bars, in combination, substantially as set forth.

14. In a stanchion, upright standards, horizontal rails connecting the same at the top and bottom, chain-rods secured to the upright standards by swivels, swivels attached to each end of the chain-rods, a ring connecting the free ends of the chain-rods in the space between the standards, chains or other suitable means for securing the cattle depending from the ring, in combination, substantially as set forth.

699,202. ELECTRIC GAS-LIGHTER. ADOLF J. MARSHALL, Litchfield, N. Y. Filed Mar. 4, 1901. Serial No. 50,394. (No model.)

Claim.—1. In an electric gas-lighter, the combination of a conducting-battery casing, a battery having an internal and an external pole located in and insulated from said casing, a lighting-coil, a conducting-support for the same with which one terminal of said coil is electrically connected, means for detachably and electrically connecting the coil-support

with the casing, a conductor connecting with the other terminal of the coil and detachable with said coil-support from said casing, a contact for connecting said conductor with said internal pole of the battery, and a hand-controlled means for making electrical connection between said casing and said external pole of the battery, substantially as set forth.

2. In an electric gas-lighter, the combination with a lighting-coil, a supporting screw-cap and tubular stem, an insulated wire arranged within said stem, and a lighting-coil having one terminal connected with said cap and the other terminal with said wire, of a battery having an internal and an external pole, an insulating casing insulated from said external pole and having at its upper end a screw-thread for attachment to said cap, a circuit-breaker which is connected with said casing and adapted to make contact with the external pole of the battery, and a yielding contact interposed between the internal pole of the battery and said wire, substantially as set forth.

699,203. MACHINE FOR TWISTING AND SPINNING FIBROUS MATERIALS. JOHN MARSHALL, FORTSMOUTH, R. I., assignor of three-fourths to EDWARD E. MARSH, FORT RIVER, MASS., and T. ALBERTUS, BAY VILLE, R. I., and CHARLES T. ALBERTUS, FORTSMOUTH, R. I. Filed May 4, 1901. Serial No. 54,357. (No model.)

Claim.—1. In a spinning or twisting machine, in combination, the chambered support, the rotating ring having the lower portion thereof received within the chamber of the said support, the plates fitting around the said portion of the ring from opposite sides thereof, and the centrifugal rolls or wheels supported by the said plates within the oil-containing space of the support.

2. In a spinning or twisting machine, in combination, the chambered support having the central shaft extending upwardly within the chamber thereof and the said chamber adapted to contain oil, the rotating ring surrounding the said shaft and working within said chamber, and the centrifugal rolls or wheels working within the said chamber and engaging with the lower portion of the ring.

3. In a spinning or twisting machine, in combination, the chambered support having the central shaft rising within the chamber thereof, the rotating ring surrounding the said shaft, the plates fitting around the said ring from opposite sides thereof, and the centrifugal rolls or wheels supported by the said plates within the chamber.

4. In a spinning or twisting machine, in combination, the chambered support, the chamber thereof being adapted to contain oil, the rotating ring working within said chamber, and the centrifugal rolls or wheels engaging with the said ring and working in the oil-containing chamber of the said support, substantially as described.

5. In a spinning or twisting machine, in combination, the chambered support, the chamber thereof being adapted to contain oil, the rotating ring having the depending skirt entering the chamber of the said support, and the centrifugal rolls or wheels engaging with the said skirt and working in the said chamber.

6. In a spinning or twisting machine, in combination, the rotating ring, the plates fitting around the lower portion of the ring from opposite sides, and the centrifugal rolls or wheels carried by the said plates and engaging with the lower portion of the said ring.

7. In a spinning or twisting machine, in combination, the chambered support, the chamber thereof being adapted to contain oil, the rotating ring, provided with a guide through which the material being twisted or spun is fed, with means for receiving applied force whereby to drive the same, and with a depending skirt working within the said chamber, and a series of centrifugal rolls or wheels also working within said chamber and making contact only with the said skirt below the place where driving power is applied to the ring.

8. In a spinning or twisting machine, in combination, the chambered support, the chamber thereof being adapted to contain oil, the rotating ring provided with a guide through which the material being twisted or spun is fed, with means for receiving applied force whereby to drive the same, and with a depending skirt shaped for engagement with the supporting rolls or wheels and working within the said chamber, and a series of centrifugal rolls or wheels also working within the said chamber and engaging with the said skirt only below the place where driving power is applied to the ring and acting to restrain the ring from vertical movement.

9. In a spinning or twisting machine, in combination, the chambered support, the rotating ring having the lower portion thereof received within the chamber of the said support, the plates fitting around the said portion

of the ring from opposite sides thereof, the centrifugal rolls or wheels supported by the said plates, and means to adjust the said plates.

699,204. AUTOMATIC VENTILATING WINDOW-LOCK. WILLIAM E. MARSH, NEWTON, MASS. Filed Jan. 15, 1902. Serial No. 55,331. (No model.)

Claim.—1. A window-fastening comprising a spring-actuated bolt mounted in a casing secured to the top of the lower sash, a catch which when said bolt is retracted automatically engages the bolt and holds it retracted until said catch is tripped, a lock-plate on the upper sash which is adapted to be engaged by said bolt which can enter or withdraw from the lock-plate only when both sashes are closed, and a tripping device for said catch consisting of a double spring-wire forming two arms, the end of one arm being secured on the back side of the lock-plate, the other arm being formed with a hump which projects through a slot in the lock-plate and which is so formed that when either sash is opened the said projection will not trip said catch, and by the operation of closing either sash the catch will be tripped, substantially as described.

2. A window-fastening, comprising a spring-actuated bolt mounted in a casing secured to the top of the lower sash, a catch which when said bolt is retracted engages the bolt, a slotted lock-plate on the side rail of the upper sash and a tripping device for said catch consisting of a double spring-wire forming two arms, the end of one arm being secured at the back of the lock-plate, the other arm being formed with two humps which project through a slot in the lock-plate, said humps being so formed that when either sash is opened neither of the humps will trip said catch and in the operation of closing either sash one of said humps will trip the catch, the other hump serving as a guard to ward the tripping-hump from engagement with the rear side of the lower sash while the sash is being closed, substantially as described.

699,205. ELECTRICAL TAP-SOCKET. RUEL B. MAYNORTH, NEW YORK, N. Y., assignor to the Maynorth Manufacturing Co., a Corporation of New Jersey. Filed Aug. 27, 1901. Serial No. 73,463. (No model.)

Claim.—1. In a tap-socket, the combination of plug and socket parts, a circuit-controller contained therein, and having a reciprocating movement in a transverse direction and circuit-terminals whereby two circuits can be put into series or parallel with each other at will.

2. In a tap-socket, the combination of plug and socket parts, a circuit-controller contained therein and movable to project from one side or the other and circuit-terminals arranged so that when the circuit-controller is projecting from one side two circuits will be in parallel and when projecting from the other side the two circuits will be in series.

3. In a tap-socket, the combination of a circuit-controller movable to project from one point or the other thereof, and a branch circuit adapted to be connected with the projecting part of the circuit-controller to thereby be connected in series or parallel with the second circuit.

4. In a tap-socket, the combination of a circuit-controller having a portion adapted to be moved to change the relation of the circuits and a branch circuit whose terminals are removably connected with said portion, substantially as described.

5. In a tap-cocket, the combination of a movable circuit-controller, fixed contacts adapted to cooperate therewith, said circuit-controller being double-ended and adapted when pushed inward on one side to project from the other side and means whereby the terminals of a branch circuit can be connected with either end of the circuit-controller to thereby connect the branch circuit in series or parallel with the second circuit, substantially as described.

6. In a tap-cocket, the combination of plug and socket parts secured together, two contacts mounted thereon and adapted for parallel connection with a branch circuit, and two other contacts mounted thereon and adapted for series connection with a branch circuit.

699,208. SAW-FILING DEVICE. LEON H. MILLER, Wisconsin, Wis., assignor of one-half to George Harris, Wisconsin, Wis. Filed Jan. 13, 1902. Serial No. 69,891. (No model.)

Claim.—1. In a saw-filing device, a frame having depending sides which converge longitudinally, a reciprocating file-holding frame connected thereto, longitudinally-movable wedges between the depending sides of the frame, and means for moving said wedges, substantially as shown.

2. In a saw-filing device, a frame having depending and converging sides, a movable file-carrying frame mounted thereon, a pawl connected to the first-mentioned frame for engagement with the teeth of a saw, wedges reciprocally attached to the depending sides of the frame, and means for moving the wedges with respect to the frame.

3. In a saw-filing device, a frame, means for connecting thereto a file-holder, a pawl carried by the frame to engage the saw-teeth when the frame is mounted on a saw, wedges carried by the frame, and a thumb-lever mounted on the frame and connected to the wedges, substantially as shown.

4. In a saw-filing device, a frame in which the top and sides are partially cut away to provide a recess, a pawl carried by the frame to depend below the top, a file-carrier reciprocally attached to the frame, wedges maintained between the sides of the frame, a lever pivoted on the frame, and means for connecting the lever members of the lever to the wedges, substantially as shown.

5. A frame for a saw-filing device made up to present longitudinally-converging sides and top, an end portion which projects upward at right angles to the top, an inclined portion designed to support a gage, legs which extend above the top, the frame being cut away centrally and provided with slots through the sides, in combination with a file-holder attached to the projecting portion at one end of the frame, a gage carried by the intermediate inclined portion, a lever pivoted on the legs, and bars connected to the lever and to wedges positioned between the converging sides, substantially as shown.

6. In a saw-filing device, the combination with a file-holder, of cylindrical heads adjustable longitudinally and relatively attached to the file-holder, each head having to one side of its center opening to receive the file, and means for clamping the file in each opening.

7. The combination with the frame of a saw-filing device said frame having wedges which are longitudinally adjustable in the frame to clamp against the saw and hold the frame over the teeth thereof, a pawl adapted to engage the saw-teeth, a gage movable in conjunction with the pawl to limit the movement of the file toward the teeth of the saw, a reciprocating file-holding frame mounted on the saw-engaging frame, the holding heads which are relatively mounted in rings which form a part of the file-holding frame, and a bar for engagement with the heads, substantially as shown.

699,207. COMBINATION-TOOL. SARAH A. NIX, Minneapolis, Minn. Filed July 22, 1901. Serial No. 69,891. (No model.)

Claim.—1. The combination with a tool-handle, of a tool pivoted thereto and provided with a notched disk, and a locking element pivoted to said handle and provided with a notch adapted to be moved into registration with the periphery of said disk to permit free movements of said pivoted tool, said locking element in other positions being engageable with one of the notches of said disk, to lock said pivoted tool in a set position.

2. The combination with a tool-handle, of a pair of tools pivoted thereto and provided with disk-like pivoted ends, the peripheries of which intersect, and each of which disk-like ends have notches cut on the line of an arc struck from the center of the other member, whereby either tool may be locked by the disk-like end of the other, substantially as described.

3. The combination with the bifurcated tool-handle having a rigidly-connected blade 1 of the jaw 7 provided with a notched disk 9 pivoted between the sides of the handle at 8, the lock-tumbler 11 pivoted between the sides of the handle at 12 and provided with the notch 13, and the tool 14 also pivoted at 12, and provided with the rounded lock portion 15 and notch 16, which parts cooperate, substantially as described.

699,208. VACUUM-TUBE CURVE. DANIEL H. MOORE, Newark, N. J., assignor to Edison Electrical Company, New York, N. Y., a Corporation of New York. Filed Apr. 13, 1901. Serial No. 69,891. (No model.)

Claim.—1. In the center, the combination with the direct-interceptor, of a permanent magnet located under the tail of the vibrating armature and an adjustable plate in which said magnet is mounted.

2. In the center the combination with the vibrator of a solenoid mounted above it, a vibrating core for the solenoid having an extension for striking the vibrator, and a vertically-adjustable core located in the upper end of the solenoid.

3. In the center the combination with the vibrator of a solenoid mounted above it, a vibrating core for the solenoid having an extension for striking the vibrator, an electric contact carried by said core, a spring-contact upon which the core normally rests, and a tension device for said spring.

4. In the center the combination with the vibrator-tube, of a curved arm therein having a pivot formed thereon and the armature supported on said pivot.

5. In an oscillator substantially as described, the combination with the circuit-breaking armature, of a permanent magnet located under one end thereof and adjustable longitudinally of said armature, for the purpose set forth.

699,209. HAND-POWER BRAKE FOR RAILWAY-WAGONS. DAVID J. HOSMAN, Bury, England. Filed June 20, 1901. Serial No. 69,891. (No model.)

Claim.—1. In an either-side hand-power brake for railway-wagons or trucks the combination of a stop-rod A, washers C over same at lower side of each lever B from tube bearing on said washers and handles G with a catch C' fixed to said lever tube C' and rack D for said catch to engage with substantially as described.

2. In an either-side hand-power brake for railway-wagons the combination of a lever J, with connecting-rod G, having slot g' to operate brake-levers B from the wagon or buffer, substantially as described.

699,210. HAND-FUNCH. SARAH C. MOORE, New York, N. Y., assignor to Charles Morris, deceased. Filed Oct. 2, 1901. Serial No. 71,408. (No model.)

Claim.—1. The combination with the support therefor of an interchangeable and adjustable die opposing shoulders on said die and support, the movable washers united between the shoulders and jam-nut, substantially as shown and described.

2. The combination with a hand-punch having a horizontally-moving plunger and interchangeable and adjustable die of the interchangeable punch point or end, the shoulder thereon, said punch end secured to the end of the plunger, substantially as shown and described.

699,211. BARREL-FILTER. DE WITT C. MOORE, Colorado City, Colo., assignor to Charles H. MacCall, Colorado Springs, Colo. Filed Feb. 2, 1902. Serial No. 69,891. (No model.)

Claim.—1. A barrel-filter comprising filter-sections, the plates having projections on their outer sides and perforations through the plates arranged between the projections and having beveled longitudinal edges.

whereby the adjacent sides of the sections may be united by burning, substantially as described.

2. The combination with the head lining of a filter-barrel, of filter sections or plates having projections on their outer sides and perforations through the plates between the projections, and having beveled edges whereby the plates may be united to the lining by burning, substantially as described.

3. The combination with the head lining of a filter-barrel, of filter sections or plates having projections on their outer sides and perforations through the plates between the projections, the plates having beveled longitudinal edges and beveled ends, whereby the plates may be united together and to the head lining by burning, substantially as described.

4. The combination with the head lining of a filter-barrel having an opening, of filter sections or plates having projections on their outer sides and perforations through the plates between the projections, the plates being adapted to be burned together at their edges and to the lining at their ends, and a strengthening-plate adapted to extend over the opening in the barrel and to be secured to a section by burning, substantially as described.

5. In a barrel-filter, a filter-section having steel projections on one side, tapering perforations through the body of the section between the projections, and provided with beveled edges whereby various sections may be united to form a filter having a plate, perforated inner surface, substantially as described.

699,212. BARREL-FILTER. DE WITT C. MOORE, Colorado City, Colo., assignor to Charles H. MacCall, Colorado Springs, Colo. Filed Feb. 2, 1902. Serial No. 69,891. (No model.)

Claim.—1. A filter comprising pairs of filter-plates, provided with extensions on their adjacent ends, said extensions constructed and adapted to form when joined a longitudinal channel between the adjacent ends of the plates, substantially as described.

2. A filter comprising pairs of filter-plates having perforations and provided with imperforate extensions on their adjacent ends, said extensions constructed and adapted to form when joined a longitudinal channel between the adjacent ends of the plates, substantially as described.

3. The combination with the lining of a filter-barrel, of strips or supports united to the lining, and filter-sections provided with perforations supported on the strips and secured to the lining, substantially as described.

4. The combination with the lining of a filter-barrel, of strips or supports burned to the lining, the lining and strips or supports being of such material that they can be burned together, and filter-sections supported on said strips and secured to the lining, said sections being provided with imperforate extensions on their adjacent ends, substantially as described.

5. The combination with the lining of a filter-barrel, of filter-sections, and supports between the lining and sections, the sections being in pairs as constructed and arranged to form a longitudinal channel between the adjacent ends of the pairs, substantially as described.

6. The combination with the lining of a filter-barrel, of filter-sections, and supports between the lining and sections, the sections being arranged in pairs and provided with extensions as constructed as to form a longitudinal channel between the adjacent ends of the pairs, substantially as described.

7. The combination with the lining of a filter-barrel, of perforated filter-sections, and means for supporting said sections and securing them to the lining, said sections having their adjacent ends as constructed and arranged to form a longitudinal channel, substantially as described.

699,213. COMBINED WIRE STAPLER, CUTTER, SPLICE, AND STAPLE-PULLER. JAMES HOSMAN, Westerville, Ohio. Filed Oct. 2, 1901. Serial No. 71,407. (No model.)

Claim.—1. In combination with a bar or lever, a frame secured thereto having a stationary wire-cut $2'$ lying next the face of the bar and laterally-extending ribs $2'$ and $2''$ to fit the opposite edges of the bar the rib $2'$ affording a shearing edge and a lever 3 fulcrumed in the said bar having a wire-clamping end $3'$ to coast with said wire-cut $2'$ and a shearing edge to coast with the shearing member $2'$, substantially as described.

2. In combination with a bar or lever, a frame secured thereto having a stationary wire-cut $2'$ lying next the face of the bar and laterally-extending ribs $2'$ and $2''$ to fit the opposite edges of the bar, the rib $2'$ affording a shearing edge, a cross-piece $2'$ between the ribs $2'$ and $2''$, and a lever 3 fulcrumed between the said cross-piece and cross-piece and having a wire-clamping end $3'$ to coast with said wire-cut $2'$ and a shearing edge to coast with the shearing edge of the rib $2'$, substantially as described.

3. In combination with a bar or lever, a frame secured thereto having a stationary wire-cut $2'$ lying next the face of the said bar and laterally-extending ribs $2'$ and $2''$ to fit the opposite edges of the said bar, the rib $2'$ affording a shearing edge, a cross-piece $2'$ between the ribs $2'$ and $2''$, a wire-clamping notch $3'$ in said cross-piece, and a lever fulcrumed between the said cross-piece and cross-piece and having a wire-clamping end to coast with the cut $2'$ and a shearing edge to coast with the shearing edge of the rib $2'$ and the wire-clamping notch $3'$ in the cross-piece, substantially as described.

699,214. WINDOW-BRACKET. CARLES E. HENNING, Washington, D. C. Filed Feb. 4, 1902. Serial No. 92,511. (No model.)

Claim.—1. A device of the class described, consisting of a back plate, flanged brackets hinged vertically to the back plate to fold inwardly, and chaises removably engaging at their ends the flanges of the brackets.

2. A device of the class described, consisting of a back plate, brackets hinged to the back plate to fold inwardly and brackets having flanges at their top provided with openings, and chaises and rods having downturned ends removably engaging the openings.

3. A device of the class described, consisting of a back plate having an arm toward its upper side, brackets hinged to the back plate to

fold inwardly and brackets having top flanges and openings in the flanges, chaises and rods having downturned ends engaging the flange-openings, holders on the back plate for the detached chaises and rods, and receptacles on the device for chaises and the like.

699,215. ELECTRICAL OUTLET-BOX. RICHARD W. MILLER, Brooklyn, N. Y. Assignor to Robert Krantz, Brooklyn, N. Y. Filed Mar. 11, 1902. Serial No. 97,748. (No model.)

Claim.—1. An electrical outlet-box having a receptacle-carrying part adjustable on the body of the box to shift the center of the receptacle.

2. An electrical outlet-box having a receptacle-carrying part adjustable crosswise and rotarily upon the body of the box to shift the center of the receptacle.

3. An electrical outlet-box, having a receptacle-carrying cover in two parts, one adjustable on the other and the two adjustable on the body of the box to shift the center of the receptacle.

4. An electrical outlet-box, having a receptacle-carrying cover in two parts, one adjustable crosswise on the other and the two adjustable rotarily on the body of the box, as and for the purpose described.

5. An electrical outlet-box having a receptacle-carrying cover adjustable crosswise of the body of the box, as and for the purpose described.

699,216. ALUMINUM ALLOY. RICHARD HUNTER VIGOR, Austria-Hungary. Filed Aug. 14, 1900. Serial No. 24,893. (No specimen.)

Claim.—An aluminum alloy consisting of one hundred parts of aluminum to three to sixteen parts of copper to twelve to two parts of zinc, the amount of zinc being twice the amount of copper, substantially as set forth.

699,217. CENTRIFUGAL MACHINE. HENRY McDERMOTT, Westchester, Pa. Filed July 29, 1902. Serial No. 94,888. (No model.)

Claim.—1. In a centrifugal machine, a suspended centrifugal liquid-separator vessel having an axial feed-inlet at its lower end, and a fixed supply-nozzle below said inlet arranged in alignment with the normal axis of rotation of the vessel.

2. In a centrifugal machine, a suspended centrifugal liquid-separator vessel having an axial feed-inlet at its lower end, a fixed supply-nozzle below said inlet arranged in alignment with the normal axis of rotation of the vessel, and a drip-cup located between said inlet and nozzle, substantially as set forth.

3. In a centrifugal machine, a suspended centrifugal liquid-separator vessel having an axial feed-inlet at its lower end, provided with a flaring mouth, and a fixed supply-nozzle below said inlet arranged in alignment with the normal axis of rotation of the vessel.

699,218. ELECTRIC SWITCH-OPERATING DEVICE. ALFRED J. McULLOUGH, Mendota, Pa. Filed Mar. 29, 1901. Serial No. 92,482. (No model.)

Claim.—1. In switch-operating mechanism, the combination with the switch-tongue, of a vertically-arranged solenoid, a chain or other flexible means connected directly to both the switch-tongue and the core of the solenoid, and a pulley below said solenoid around which said chain passes.

2. In switch-operating mechanism, the combination with the switch-tongue, a spring bearing against said switch-tongue to hold it normally in one position, of a vertically-arranged solenoid, a chain or other flexible means connected directly to both the switch-tongue and the core of said solenoid, and a pulley below said solenoid around which said chain passes.

3. In switch-operating mechanism, the combination with a switch-piece provided with a floor or bottom and having an open space beneath the same, of a switch-tongue pivoted therein and provided with a projection extending down through a slot in the bottom of the switch-piece, a spring located in the space beneath the switch-piece and bearing against said projection, a solenoid, and connection between said switch-tongue and the core of said solenoid.

4. In switch-operating mechanism, the combination with a switch-piece provided with a perforated bottom and having an open space beneath the same, of a switch-tongue pivoted therein and having two downwardly-extending projections extending through slots in the bottom of the switch-piece, a spring located in the space beneath the switch-piece and bearing against one of the projections on the switch-point, a chain connected to the other of said projections, and the solenoid to the core of which the opposite end of the chain is connected.

699,219. APPLE-CRUSHER FOR CIDER-MILLS. JOHN F. McDONALD, Carthage, N. C. Filed Aug. 4, 1900. Serial No. 24,295. (No model.)

Claim.—1. In a device of the class described, the combination of a frame, having openings, a hopper, a grinding-cylinder, a presser or apron having a transverse perforation, a rod extending through the perforation of the presser or apron and having its ends arranged in the openings of the sides of the frame, and wedges also arranged in the said openings and engaging the ends of the rod and holding the latter against longitudinal movement, substantially as described.

2. In a device of the class described, the combination of a frame having openings, a hopper, a grinding-cylinder, a presser or apron, a rod

extending through the presser or apron and arranged in the said openings, a wedge mounted in one of the openings and engaging the rod, and means for locking the wedge in place, substantially as described.

699,220. MACHINE FOR FACILITATING THE PRODUCTION OF INTAGLIO PRINTING-FORMS. GEORGE F. McLENNAN, Boston, Mass. Assignor of two-thirds to James W. McIndoe, Boston, Mass., and Arthur E. Whitney, Winchester, Mass. Filed Sept. 4, 1901. Serial No. 74,868. (No model.)

Claim.—1. In an apparatus of the class described, the combination of a longitudinally-reciprocating bed; means for securing thereon a fixed position thereto a wood block; a shaft located above said bed; a metallic cylinder to be developed into an intaglio printing-form mounted on said shaft with its lowest portion at such a distance above said bed that the wood block may be fed beneath it without touching it; an elastic roller; means for alternately supporting said elastic roller in positions to contact with the wood block on said bed, and with the periphery of said metallic cylinder; means for reciprocating said bed; and means for intermittently rotating said cylinder and elastic roller.

2. In a machine of the class described, the combination with side frames each provided with the bearings 2, and the forked stands 26 and 27; the half-bones 29 and 34, adjustably mounted in the forked stands 26 and 27, respectively; a horizontally-reciprocating bed mounted upon suitable supports; gearing for reciprocating said bed; the shaft 3; the metallic cylinder 6, and gear-wheel 7 mounted on said shaft; a pinion mounted upon an adjustable stud or journal, and constructed and arranged to alternately engage with the gear 7, and with the gearing for reciprocating said bed; and the elastic roller 22, constructed and adapted to be alternately mounted in the half-bones 34 with its periphery in contact with the wood block on said bed, and in the half-bones 29 with its periphery in contact with the periphery of said metallic cylinder 6.

3. In a machine of the class described the combination with the metallic cylinder 6, and the elastic roller 22, and means for revolving said cylinder and roller in end view, of the rollers 27 secured upon the shaft of the cylinder 6, and each provided with the ears 30 and 31 arranged at right angles to each other; a shaft-supporting arm pivoted to each of said rollers 27 between said ears 30 and 31; the roller-shaft 43 mounted in bearings in said supporting-arm; and the guard-plate 44 carried by said shaft, and constructed and arranged to operate substantially as described.

The combination of the shaft 3; the cylinder 6 and gear-wheel 7 mounted on said shaft; the elastic roller 22 mounted in bearings above said cylinder 6, and arranged to be rotated by contact therewith; the rollers 27 firmly secured upon said shaft-3, and each provided with ears 30 and 31 arranged at right angles to each other; a block 41 pivoted to each

of said collar between the ears 35 and 36; a stud 43 adjustably set in each of said blocks 41; the shaft 45 mounted in bearings in said studs; the guard-plate 44 carried by said shaft 45; the stop screw 50 and 51; and means for revolving said cylinder 6 and roller 33 in unison.

3. The combination of the metallic cylinder 6; the elastic rollers 33; means for rotating said cylinder and roller in unison; and a plurality of removable weights 52, 53, mounted on the shaft of said elastic roller, substantially as described.

699,321. ROBE-REEL. JOHN McKIM, Warren, Ohio. Filed Mar. 12, 1891. Serial No. 81,022. (No model.)

Claim.—A reel comprising four side members, two of which are provided at one end with handles and at the other with shafts, the other two members being connected with the first-named members intermediate of their ends, base-pieces connecting the four members, supporting-wheels carried by the base members at the rear portion thereof, a shaft passing through the four side members and carrying a reel and a driving-gear, a pawl-controlled gear in mesh with the driving-gear, and located adjacent to one of the handles of the frame, and a crank on the shaft of the latter gear, substantially as and for the purpose specified.

699,322. METHOD OF MAKING HATS AND ARTICLE PRODUCED THEREBY. JOHN H. HRAVE, Macleodfield, England. Filed Oct. 19, 1899. Serial No. 33,547. (No model.)

Claim.—1. The process of making hats from wool, fur or analogous fibers, which consists in progressively building from the fibers a body of the general form of the hat, incorporating in the fibers as the formation of the body progresses, a stiffening material, and finally treating the formed body to cause the material to stiffen and bind the fibers together and preserve the integrity of the body.

2. The process of making hats from fur, wool or like fibers, which consists in depositing on the fibers a stiffening material, progressively building up from said fibers a body of the general form of the hat, and finally treating the body to cause the stiffening material to bind the fibers together.

3. In the process of making hats from fur or wool or like fibers treating the fibers with an acid, subjecting them to an alkaline solution of resin whereby the resin will be precipitated on the fibers, and forming a body from the fibers thus treated.

4. The method of making hats from fur or wool or like fibers which consists in treating the fibers in an acid-bath to cause the acid to impregnate them, providing a solution of resin and alkali, subjecting the fibers to the action of this solution to precipitate the resin, forming a body of fibers thus treated, and finally treating the body to cause the resin to coalesce.

5. The improved hat consisting of a non-filled body composed of fur or wool or like fibers of short staple bound together wholly by a binding material incorporated among the fibers and curving as the sole means of preserving the form and integrity of the body.

6. The improved hat consisting of a non-filled body composed of fur or wool or like fibers of short staple bound together wholly by a binding material incorporated among the fibers, the said body having a distinct surface covering of fibers free from a binding material but united to the body by the same material that binds together the fibers of the said body.

699,323. RAIL-FASTENER. JOHN F. HENNE, Engineer, Tex., and ROSE H. HENNE, Stationer, Kans. Filed Mar. 13, 1891. Serial No. 81,361. (No model.)

Claim.—1. The combination with a locking member, of an eccentric adapted to withdraw the same to releasing position, a follower in contact with said eccentric and adapted to be positively moved outwardly by said eccentric, and a spring situated between the follower and the locking member and adapted to be compressed between the two on the outward movement of said follower.

2. The combination with a locking member having a longitudinal slot, a fixed guide-pin passing through said slot, an eccentric tumbler mounted upon the guide-pin and having a flange-piece, a laterally-projecting portion formed on the locking member and adapted to be engaged by said tumbler, a follower in contact with said tumbler and adapted to be positively moved outwardly by said tumbler, and a spring situated between the follower and the locking member and adapted to be compressed between the two on the outward movement of said follower.

699,324. RAIL-JOINT CONNECTION. OLAV NORMAN, Stockholm, Sweden. Filed Oct. 3, 1891. Serial No. 77,460. (No model.)

Claim.—1. In a rail-joint, the combination of rails having their heads cut away wedge-shaped at the ends, two fish-plates 2, 4 entering between the rail ends, which are located apart, and replacing the portions of the rail-heads cut away, said fish-plates 2, 4 being held together by a fish-belt 6 carried through the fish-plates 2, 4 at the space between the rail ends, and here having faces 5 bearing against each other along a longitudinal plane, and a bottom plate 13 having upwardly-projecting lateral edges 12 embracing the lower portions of the fish-plates 2, 4, for the purpose set forth.

2. In a rail-joint, the combination of rails having their heads cut away wedge-shaped at the ends, two fish-plates 2, 4 entering between the rail ends, which are located apart, and replacing the portions of the rail-heads cut away, said fish-plates 2, 4 being held together by a fish-belt 6 carried through the fish-plates 2, 4 at the space between the rail ends, and here having faces 5 bearing against each other along a longitudinal plane, and a bottom plate 13 having upwardly-projecting lateral edges 12 embracing the lower portions of the fish-plates 2, 4 and rounded points 9 on the wedged ends of the rails, for the purpose set forth.

3. In a rail-joint, the combination of rails having their heads cut away wedge-shaped at the ends, two fish-plates 2, 4 entering between the rail ends, which are located apart, and replacing the portions of the rail-heads cut away, said fish-plates 2, 4 being held together by a fish-belt 6 carried through the fish-plates 2, 4 at the space between the rail ends, and here having faces 5 bearing against each other along a longitudinal plane, and a bottom plate 13 having upwardly-projecting lateral edges 12 embracing the lower portions of the fish-plates 2, 4, and fish-belts 14 for holding together the fish-plates 2, 4 and rail ends, for the purpose set forth.

699,325. ELECTRIC ARC LAMP. JOHN A. HOSCHKE, Madison, Wis., assignor to General Electric Company, a Corporation of New York. Filed Mar. 10, 1893. Serial No. 569,957. (No model.)

Claim.—1. An arc-lamp in which the carbons lie parallel with one another, for that part of each which is for illumination, each carbon from that part being inclined at an angle to the first-named part, and then provided with a carbon handle or stick whereby the carbon can be held, the distance being greater between the carbons near or at the point where the carbons are held in their respective carbon-holders, the length of the arc being increased automatically when the proper amount of carbon is consumed, substantially as and for the purpose specified.

2. An arc-lamp in which the carbons lie parallel with one another, for that part of each which is for illumination, each carbon from that part being inclined at an angle to the first-named part, and then provided with a carbon handle or stick whereby the carbon can be held, the distance being greater between the carbons near or at the point where the carbons are held in their respective carbon-holders, the length of the arc being increased automatically when the proper amount of carbon is consumed, combined with an insulating vessel adapted to place said carbons in a partial vacuum, substantially as and for the purpose specified.

3. In an arc-lamp, two parallel carbons, capable of being approximated at their working (small) ends, and having straight portions, and then an angled portion, and another or third portion substantially parallel to the first portion, these portions of the carbons which are to be used in illumination being at a given distance, and the other parallel portions being further apart, substantially as and for the purpose specified.

4. In an arc-lamp, two parallel carbons, capable of being approximated at their working (small) ends, and having straight portions, and then an angled portion, and another or third portion substantially parallel to the first portion, these portions of the carbons which are to be used in illumination being at a given distance, and the other parallel portions being further apart, in combination with a coil or coils or an electromagnet, sitting up magnetic lines of force that attract or repel the carbons as so as to maintain the arc at the extreme ends of the carbons, and an insulating vessel, said carbons being instead in a partial vacuum, substantially as and for the purpose specified.

5. In an arc-lamp, the combination of two carbon electrodes, substantially parallel, a supporting-frame, one carbon-holder stationary with the frame, the other carbon-holder pivotally suspended from the frame, the armature HAA, fixed thereto, electromagnet, core E, M, carrying curved-threads, support provided with interior curved-threads engaged by the curve of the core, the core extending down and bearing against the armature HAA, and adapted by the construction aforementioned to be adjusted in a direction toward or away from the armature, substantially as and for the purpose specified.

6. In an arc-lamp, the combination of two carbon electrodes, substantially parallel, a supporting-frame, one carbon-holder stationary with the frame, the other carbon-holder pivotally suspended from the frame, the armature HAA, fixed thereto, electromagnet, located above the supporting-frame, core E, M, thereof adjustable through the frame, by means of curved-threads on it, and below the frame, bearing against the armature HAA, and adapted by the construction aforementioned to be adjusted in a direction toward or away from the armature, substantially as and for the purpose specified.

7. In an arc-lamp, the combination of two carbon electrodes, substantially parallel, a supporting-frame, one carbon-holder stationary with the frame, the other carbon-holder pivotally suspended from the frame, the armature HAA, fixed thereto, electromagnet, located above the supporting-frame, core E, M, of the electromagnet extending through the latter, including-bearing in the frame, having interior curved-threads, core having a curved-threads, engaging the curved-threads of the bearing, and extending through and down against the armature, the arc being adjustable, substantially as and for the purpose specified.

699,326. FRUIT CORER AND GRINDER. BRIAN STODOLSKY, Montreal, Can. Filed Jan. 13, 1891. Serial No. 48,741. (No model.)

Claim.—1. In a fruit-pitting machine, the combination of a sliding frame, links pivotally connected at one end to said frame, a yielding frame carried by said sliding frame and pivotally supporting the opposite edges of the cutters, means for reciprocating said sliding frame, means for supporting the fruit during the operation of the cutters, and means interposed in the path of said yielding frame for offering a resistance to its movement, substantially as described.

2. In a fruit-pitting machine, the combination of a sliding frame, arms carried thereby, links pivoted at one end to said frame, a yielding frame supported by said arms, cutters pivoted at their cutting edges to said frame with said cutting edges arranged in close proximity to each other, said cutters at their opposite edges being pivoted to the opposite ends of the links, means for reciprocating said sliding frame, means for supporting the fruit during the operation of the cutters, and a stop interposed in the path of said yielding frame, substantially as described.

3. In a fruit-pitting machine, the combination of a support, standard raised therefrom and carrying guides, a frame sliding in said guides, a sliding frame formed diverging, arms carried by said sliding frame, a yielding frame movable upon said arms and moving in said guides, a sectional cutter carried by said yielding frame, the sections of the cutter being pivoted to said frame at their cutting edges, links pivoted to the outer-sections at their opposite edges and to the arms carried by the sliding frame, means for reciprocating said sliding frame, and a stop interposed in the path of said yielding frame, substantially as described.

4. In a fruit-pitting machine, the combination of a table formed with openings, an impaling-blade carried by said table and disposed between said openings, a reciprocable sectional cutter having the sections thereof arranged parallel with each other and separable at their upper edges so as to follow the lobes of the fruit and said openings, means for reciprocating said cutter and means for offering the operation of said cutter-sections, substantially as described.

5. In a fruit-pitting machine, the combination of a table, a vertically-movable substantially rectangular frame slidable on said table, a cutter carried by said frame, an intermediately-pivoted lever supported by said table and engaging said frame, a pulley mounted in said lever, a rope attached to the frame and passing over said pulley, a weight carried by said rope, a treadle, and an operative connection between said treadle and said lever, substantially as described.

699,327. COW-TAIL HOLDER. WILLIAM E. OSWEN, Kansas, Ind. Filed July 6, 1891. Serial No. 67,348. (No model.)

Claim.—1. In a device of the character described, a framework designed to hold the tail of a cow, consisting of wire bent so as to form V-shaped portions F and G, bent-in portions I formed in the upper V-shaped portion, base H connecting the two V-shaped portions, springs secured to said base, and means for attaching said springs to the body of the cow, substantially as described and for the purpose specified.

2. In a tail-holder attachment for cows, a forked framework adapted to embrace the tail, portions of said framework bent inward so as to rest against the hind quarters of the cow, springs, one end of which are attached to said framework, a band adapted to encircle the body of the cow, the other end of said springs attached to said band, substantially as described and for the purpose specified.

3. In a device of the character described, two V-shaped portions, vertically-disposed base connecting said portions, shoulders formed on the upper portion, a band for embracing the body of the animal, and springs connecting the base and band, as and for the purpose described.

699,228. REVOLUTION-INDICATOR. WILLIAM R. PARK, Thornton, Mass., assignor to Hancock Indicator Company, Boston, Mass., a Corporation of Massachusetts. Filed Dec. 26, 1901. Serial No. 57,514. (No model.)

Claim.—1. In a revolution-counter, the combination of a dial, a plurality of pointers, mounted on independently-driven shafts, the connection between one at least of the said shafts and its driving mechanism comprising a gear-wheel, loose on the shaft, a fixed collar on the shaft, a loose collar on the shaft between the fixed collar and the gear-wheel, a friction-washer between the loose collar and the gear-wheel, a second fixed collar on the other side of the gear-wheel, and a spring coiled around the shaft between the fixed and loose collars whereby the loose collar, friction-washer, and gear-wheel are cramped into close contact.

2. In a revolution-counter, the combination of a dial, a plurality of pointers, mounted on independently-driven shafts, the connection between one at least of the said shafts and its driving mechanism comprising a gear-wheel, loose on the shaft, a fixed collar on the shaft, a loose collar on the shaft between the fixed collar and the gear-wheel, a friction-washer between the loose collar and the gear-wheel, a second fixed collar on the other side of the gear-wheel, means for preventing the loose collar from turning on the shaft, and a spring coiled around the shaft between the fixed and loose collars, whereby the loose collar, friction-washer, and gear-wheel are cramped into close contact.

3. The combination, in a revolution-counter, of a dial, a pair of independent pointers, mounted respectively on concentric independently-rotating shafts, a worm-wheel on each shaft, frictional connection between the worm-wheels and their respective shafts, comprising shaft-collars, leather-board washers, clamping-rings, and clamping-springs; and driving-worms meshed with the worm-wheels, substantially as described.

699,229. RUFFLER. WILLOW R. PARKER, Chicago, Ill. Filed Dec. 2, 1900. Serial No. 124,504. (No model.)

Claim.—1. In a ruffler, the combination of a pair of opposed pendulum-links, separate pivots suspending said links, means supporting said pivots, a ruffler-blade, and pivots, each forming a connection of its own

between said blade and links, and means for actuating said blade and links, substantially as described.

2. In a ruffler, the combination with a main frame of a pair of pendulum-links, pivots therefor separated from each other on said frame, a ruffler-blade pivotally secured to the links and supported thereby, and means for reciprocating said blade, substantially as described.

3. In a ruffler, the combination with a main frame, a ruffler-blade, a pair of links pivotally depending from the opposite ends of said main frame and forming a vibratory support for a ruffling-blade, the toothed end of which is suspended at a point between said links and an actuating-lever for reciprocating said blade, substantially as described.

4. In a ruffler, the combination with a main frame, of a pair of pendulum-links pivotally supported from said main frame, a ruffling-blade pivotally suspended at a point between said links, and means for reciprocating said blade and adjusting the movement thereof, substantially as described.

5. In a ruffler, the combination with a main frame provided with upstanding supports separated from each other, of a pair of pendulum-links respectively pivoted to each of said supports, a ruffler-blade pivotally secured to the depending ends of the links and suspended therefrom, and means for oscillating one of said links to reciprocate said ruffler-blade, substantially as described.

6. In a ruffler, the combination with a main frame provided with upstanding supports arranged opposite each other at a distance apart, a pair of pendulum-links pivotally supported from said upstanding supports, a ruffling-blade pivotally supported by said links, an actuating-lever and a pivot therefor common to one of said supports, means reciprocating said blade and for regulating its length of stroke, substantially as described.

7. A ruffler, comprising a frame approximately L-shaped in its main portion, standards at opposite ends thereof, pendulum-links respectively pivotally depending from each standard, a ruffler-blade support pivotally suspended by and at a point between said links and arranged within the angle of the L-shaped frame, a ruffler-blade carried by said support, a tappet-lever pivoted to one of the standards, tappet-connections upon one of the adjacent pendulum-links in the path of oscillation of said tappet-lever, and means for varying the amount of lost motion between tappet-lever and pendulum-link, substantially as described.

8. In a sewing-machine attachment, the combination with an actuating-lever adapted to engage the needle-bar, of pivoted adjusting devices on said lever, and means for locking said devices in adjusted position, comprising an arm pivotally mounted on the lever, a marginal edge on the lever concentric with the pivot-point, and a set-screw threaded through the pivoted arm and impinging upon said concentric edge of the lever, the extremity of the arm being folded around said edge opposite said screw, substantially as described.

9. In a ruffler, the combination with a tappet-lever and a tappet-block pivotally mounted thereon, of means for adjustably locking said tappet-block in position comprising a holding-arm connected with the tappet-block, a segment-surface upon said tappet-lever, over which said holding-arm is arranged to sweep, having a marginal edge formed concentrically with the pivot of the holding-arm and around which concentric margin the free end of the holding-arm is returned, and a set-screw threaded through said holding-arm and arranged to clamp the edge of the segment between its impinging end and the returned end of the holding-arm, as and for the purposes described.

10. In a ruffler, the combination with the main frame, a ruffler-blade provided with a toothed end and movably mounted in said frame, means permanently limiting the back stroke of the toothed edge of said blade to a point on a line across said edge and through the needle-hole, means reciprocating said blade to form a ruffle after the needle has made a stitch, and means withdrawing said blade from the formed ruffle after the stitch is fully tightened, substantially as described.

11. In a ruffler the combination with the main frame, a ruffling-blade provided with a toothed end and movably mounted in said frame, means permanently limiting the back stroke of the toothed edge of said blade to a point on a line across said edge and the needle-hole, means of reciprocating said blade to form a ruffle after the needle has made a stitch, means

withdrawing said blade from the formed ruffle after the stitch is fully tightened and means for varying the forward stroke of the ruffing-blade, substantially as set forth.

12. In a ruffler, the combination with the main frame, of a ruffing-blade movably mounted thereon with its toothed end permanently stopping on a line transversely thereof and approximately across the needle-hole when the blade is retracted, means for reciprocating said blade to project its toothed end beyond the needle-hole, and means for varying the forward stroke of the blade, substantially as described.

13. In a ruffler, the combination with a main frame, provided with a pair of depending pendulum-links, parallel with and separated from each other, of a ruffing-blade pivotally supported by said links, an actuating-lever for reciprocating said ruffing-blade, the cloth-engaging end of the ruffing-blade extending approximately to the path of the needle, when the blade is retracted, and an adjustable contact applied in connection with the actuating-lever for varying the amount of advance of the blade beyond the needle on the upstroke of the lever, substantially as described.

14. In a ruffler, the combination with a main frame, of parallel links pivoted to said frame at points separated from each other, a ruffing-blade pivotally supported from said links, an actuating-lever for advancing and returning the ruffing-blade through the medium of contact-points, and an adjusting-lever having means to engage the contact-point which is engaged on the upstroke of the actuating-lever so as to advance the ruffing-blade a greater or less distance and so to engage the contact-point which is engaged on the downstroke of the actuating-lever so as to invariably return the blade to a position where the points of its teeth will be substantially coincident with the path of the needle transversely to the line of motion of the blade, substantially as described.

15. In a ruffler, the combination with the frame-plate provided with two upstanding supports, of a ruffing-blade carrier arranged adjacent to one of said supports, a link pivotally suspending the ruffing-blade from that support, another link depending from the other support, an extension rigid with the ruffing-blade support projecting across the frame-plate and pivotally suspended from the second link, and a ruffing-blade secured to said carrier, substantially as described.

16. In a ruffler, the combination with an L-shaped frame-plate provided with an upstanding support at the inner side of the leg of the L, a similar support at the foot of the L, a ruffing-blade carrier mounted in the angle of the L, a link depending from the inner side of the first support and pivotally suspending the ruffing-blade carrier, an extension in the carrier projecting across the frame-plate to the opposite side of the second support, a link depending from the latter and pivotally supporting said extension, and a ruffing-blade secured to said carrier, substantially as described.

17. In a ruffler, the combination with the frame-plate A provided with a struck-up portion a projecting rearwardly from the foot of the plate and adapted to be attached to a sewing-machine, an upstanding support A' at the inner edge of the frame-plate, a similar support A'' at the opposite edge of the struck-up portion a, the ruffing-blade, pendulum-links pivoted to said supports and to the ruffing-blade, substantially as described.

699,380. APPARATUS FOR TILLING. SHERMAN PARR, Jany. Newark. Filed June 12, 1906. Serial No. 29,000. (No model.)

Claim.—1. In a land-tilling apparatus the combination of a frame-carriage which consists of an axle carrying a plate, a plow having a beam which is provided with a tailpiece or end adapted to be connected with said plate, and a belt or bar for connecting said beam to said plate.

2. In a land-tilling apparatus the combination of a frame-carriage which consists of an axle carrying a plate, a plow having a beam which is provided with a tailpiece adapted to be connected with said plate, and a winch on said frame-carriage adapted to hoist the tailpiece of the beam to disengage the shares.

699,381. BOAT. JAMES F. POSE, Brooklyn, N. Y. Filed Aug. 12, 1907. Serial No. 72,671. (No model.)

Claim.—1. The combination of a boat, a swinging weighted heel pivoted to the hull of the boat and a swinging float tending to assume a position above the point from which it is swung, connection between said float and said heel whereby when the boat careens to one side the weight of the heel forces the float toward the mid side and its resistance acts to move the boat into upright position, substantially as and for the purpose set forth.

2. The combination of a boat having a weighted heel pivoted thereto and tending to assume a vertical position, a float pivoted concentrically upon the boat and tending to assume a position above its pivotal point, a member or arm connected rigidly with said float, and connections between said member or arm and the swinging heel, whereby when the boat careens to one side the weight of the heel forces the float toward said side and its resistance tends to move the boat into upright position, substantially as and for the purpose set forth.

3. The combination of a boat, a weighted heel pivoted to the boat and tending to swing into vertical position one or more levers projecting upwardly from said heel to a point a considerable distance above the canoe, one or more floats pivoted upon the boat and adapted to assume normally a substantially floating position, one or more lever-arms connected rigidly with each of said floats, a flexible connection extending from each of said float lever-arms and passing loosely around a fixed point on the boat and connected with the said heel-lever, whereby when the boat careens in one side the tendency of the weighted heel to swing in a vertical position forces the float toward said side and the resistance of the float to the water tends to move the boat into upright position, substantially as and for the purpose set forth.

4. In combination of a boat, a weighted heel swung beneath the boat and provided with an upwardly-projecting lever-arm, a float pivoted at its under side to the boat and adapted to normally assume substantially a floating position, a rigid arm projecting laterally from each side of the float beneath the canoe, a flexible connection extending from each of said arms across to the opposite side of the boat and passing around a fixed point on the boat and having its other end connected with a point on the lever-arm of the heel, substantially as and for the purpose set forth.

5. The combination of a boat, a weighted heel extending beneath the boat and pivoted thereto on the bow and stern of the boat, a lever-arm projecting upwardly from each end of the heel above the pivotal point thereof, a float arranged at each end of the boat and each having a depending bracket pivoted concentrically with said heel, and each provided with two laterally-projecting rigid arms extending in opposite directions, and flexible connections between the end of each of said rigid arms of the float and crossing the boat and passing around a fixed point thereon and having its other end connected with the lever-arm of said heel, substantially as and for the purpose set forth.

699,382. METHOD OF TREATING BALLAST-WIRES FOR ELECTRIC LAMPS. RUSSET E. POTTER, Pittsburg, Pa., assignor to George Westinghouse, Pittsburg, Pa. Filed July 14, 1906. Serial No. 28,661. (No apparatus.)

Claim.—1. The method of treating ballast-conductors for electric lamps which consists in heating said conductors in the presence of a compound containing as one of its constituents, the material of which the ballast-conductors are composed to such temperature as to effect a deposit of the material upon the conductors.

2. The method of treating iron ballast-conductors for electric lamps which consists in heating the conductors in the presence of a compound containing iron to such temperature and for such a period of time as will effect decomposition of the compound and a deposit of the iron therefrom upon the conductors.

3. The method of treating iron ballast-wires consisting of heating them in an inclosing chamber containing a compound of iron to such degree and for such a period of time as to effect decomposition of such compound and a deposit of iron on the ballast-wires.

4. The method of treating ballast-wires for electric lamps which consists in including a wire in a chamber containing an organic compound of iron and heating the wire to such temperature and for such a period of time as will effect decomposition of the compound and deposit the iron upon the wire.

5. The method of treating an iron ballast-wire for electric lamps which consists in including such wire in a chamber containing an organic compound of iron and passing an electric current through said wire of such volume and at such pressure as will effect a deposit of iron thereon in accordance with the resistance of the different portions thereof.

699,283. STOCK-WATERER. CHARLES G. CHASE and CHARLES J. CHASE, Des Moines, Iowa. Filed June 6, 1901. Serial No. 63,283. (No model.)

Claim.—1. In a stock-waterer, the combination with a receptacle having a projection on one wall, of a conveyor-tube carried by the receptacle and projecting from the side of the wall contiguous to the projection, said tube having a valve-seat, a valve located in the tube and coacting with the valve-seat thereof, a float arranged within the receptacle and having a connection with the valve, means for raising the tube to a reservoir, and a fastening device for securing the projection to the reservoir.

2. In a stock-waterer, the combination with a receptacle having an upstanding leg at one side, said leg being provided with an opening, of fastening means arranged to be passed through the opening of the leg and engage a reservoir, a supply-tube carried by the receptacle and located contiguous to the upstanding leg, said supply-tube being arranged to be fastened contiguous to its outer end to said reservoir, and having its inner end opening into the receptacle, a float removably secured in the end of the tube and forming a valve-seat, a plug movably mounted in the tube and having a stem passing through the float and projecting into the receptacle, and a float located in the receptacle and in co-operative relation with the valve-seat.

3. In a stock-waterer, the combination with a receptacle comprising a plurality of drinking-compartments and an intermediate float-compartment communicating therewith, said receptacle having an upstanding leg arranged at one side of the float-compartment and provided with an opening, of means passing through the opening of the leg and arranged to engage a reservoir, a supply-tube carried by the receptacle and located beneath the floating-leg, said supply-tube being curved-throated and adapted to be passed through the reservoir-wall, a float detachably secured within the outer end of the tube and having a tapered bore which forms a valve-seat, a plug movably mounted in the tube and having a stem passing through the float and projecting into the float-chamber, a float hinged in said float-chamber and arranged to shut against the projecting end of the plug-stem when the level of the water within the receptacle is lowered.

699,284. WRENCH. WILLIAM J. CHASE, Des Moines, N. Y. Filed Sept. 12, 1901. Serial No. 71,507. (No model.)

Claim.—1. In a wrench, the combination of a fixed jaw having an arm, a sliding jaw on said arm, and a lever pivoted to said arm and geared to said sliding jaw to operate the latter, the said lever also serving as the handle for operating the wrench, substantially as described.

2. In a wrench, the combination of a fixed jaw having an arm, a

sliding jaw guided on said arm and having a rack, and an operating-lever pivoted to said arm and having a gear engaging said rack, to operate said sliding jaw, said operating-lever also serving as the handle for operating the wrench, substantially as described.

3. In a wrench, the combination of a fixed jaw having an arm, a sliding jaw having a rack, an operating-lever pivoted to said arm and having a gear engaging said rack, and means to shift said gear out of engagement with said rack to enable said sliding jaw to be adjusted, for the purpose set forth, substantially as described.

4. In a wrench, the combination of a fixed jaw having an arm, a sliding jaw carried by said arm, an operating-lever pivoted to said arm, connections between said operating-lever and said sliding jaw, and means to disconnect said operating-lever from said sliding jaw, to enable the latter to be adjusted, independently of said lever, with relation to said fixed jaw, substantially as described.

5. In a wrench the combination of a fixed jaw having an arm, a sliding jaw carried by said arm, an operating-lever, pivoted to said arm and connected to said sliding jaw, to actuate the latter, and means to shift the pivot of said operating-lever and thereby disconnect the same from said sliding jaw, for the purpose set forth, substantially as described.

6. In a wrench, the combination of a fixed jaw having an arm, a sliding jaw, carried by said arm, an eccentric mounted in an opening in said arm as an operating-lever pivoted to said eccentric, said sliding jaw and said operating-lever having gear adapted to engage each other, said eccentric enabling the pivot of said operating-lever to be shifted, to disengage said gear and to compensate for the wear thereof, substantially as described.

7. In a wrench, the combination of a fixed jaw having an arm, a sliding jaw, a pivoted operating-lever, connections between the latter and the sliding jaw, means to shift the pivot of said lever to disengage the same from said sliding jaw, and means to lock said pivot-shifting means, substantially as described.

8. In a wrench, the combination of a fixed jaw having an arm provided with an opening, a sliding jaw-carried by said arm, said sliding jaw having a rack, an eccentric mounted in the opening of said arm, an operating-lever having its pivot carried by said eccentric, and a gear with which said operating-lever is provided, said gear engaging said rack, substantially as described.

9. In a wrench, the combination of a fixed jaw having an arm provided with an opening, a sliding jaw carried by said arm, said sliding jaw having a rack, an eccentric mounted in the opening of said arm, an operating-lever having its pivot carried by said eccentric, a gear with which said operating-lever is provided, said gear engaging said rack, and means to lock said eccentric against rotation, substantially as described.

10. In a wrench, the combination of a fixed jaw having an arm provided with an opening, a sliding jaw carried by said arm, said sliding jaw having a rack, an eccentric mounted in the opening of said arm, and having a peripheral notch, an operating-lever having its pivot carried by said eccentric, and said operating-lever having a gear engaging said rack, and a spring-pressed bolt to engage the notch of said eccentric and lock the latter against rotation, substantially as described.

699,285. COMBINED HAY LOADER AND PRESS. WILLIAM F. RAHNEY and EDWIN E. POSE, Mountrieve, Ohio. Filed Apr. 11, 1901. Serial No. 65,375. (No model.)

Claim.—1. In a rake attachment for a combined hay loader and press, the combination, with a wheeled supporting-frame comprising side beams, of a rake-frame comprising parallel side bars pivoted to the rear ends of said beams, a rake or gatherer pivoted to the side bars, and springs secured to the beams and side bars for normally forcing the rake-frame down and holding the rake in yielding engagement with the surface of the ground, substantially as described.

2. In a rake attachment for a combined hay loader and press, the combination, with a wheeled supporting-frame comprising side beams, of a rake-frame composed of side-bars pivotally connected to the rear ends of said beams, plate-springs secured to the bars and beams and normally tending to force the bars downward to maintain the rake in yielding engagement with the surface of the ground, a pivoted rake or gatherer carried by said bars, and means for holding the rake into and out of working position, substantially as described.

3. In a rake attachment and conveyor for a combined hay loader and press, the combination, with a wheeled frame comprising side beams suitably connected, of a gatherer-frame comprising side bars pivotally connected to the rear ends of the side beams of the wheeled frame, a conveyor-frame pivoted at its lower end to the gatherer-frame and suitably supported at its upper end, an endless conveyor mounted in said conveyor-frame, springs connected to the rear ends of the side beams of the wheeled frame and to the side bars of the gatherer-frame and acting as yielding supports for the conveyor-frame and as means for yieldingly maintaining

the rake in contact with the surface of the ground, and a rake or gatherer supported by said gatherer-frame, substantially as described.

699,286. HOOK AND EYE. LEWIS KRAMER, Reading, Pa. Filed Feb. 4, 1901. Serial No. 62,002. (No model.)

Claim.—1. A member of a hook-and-eye device formed from a single piece of wire bent to form a base, hook-shaped arms rising from opposite sides of one end of said base, a bar connecting said arms together and an approximately U-shaped support having each of its two sides designed to engage the material to which the member is secured, said support being bent to bring both of its said sides near its closed end below the plane of the base.

2. A hook and eye, comprising a member with a downwardly-bent T-shaped head, and an engaging member having a base and formed with hook-shaped arms for engaging said head and with a support which extends below the plane of said base and is adapted to hold the contiguous portion of said member elevated above the material to which the member is secured.

3. A hook and eye, comprising a member having a downwardly-bent T-shaped head, and an engaging member having a base and provided with hook-shaped arms which rise from opposite sides of one end of said base and are connected with each other, said engaging member also having a supporting-guard which underlies said arms and projects above and below the plane of said base.

4. A member of a hook-and-eye device formed from a single piece of wire bent to form a base, hook-shaped arms rising from opposite sides of one end of said base, a bar connecting said arms together and an approximately U-shaped supporting-guard which is located below the plane of the upper portions of said hook-shaped arms and has each of its sides formed with bands, co-operating with said hook-shaped arms to form contracted mouths to the latter, said guard being also bent to extend below the plane of said base.

5. A hook and eye, comprising a member having a downwardly-bent T-shaped head, and an engaging or opposite member formed from a single piece of wire bent to form a base, hook-shaped arms rising from opposite sides of one end of said base, a bar connecting said arms together and an approximately U-shaped supporting-guard which is located below the plane of the upper portions of said arms and has each of its sides formed with bands which co-operate with said hook-shaped arms to form contracted mouths to the latter, said guard having its closed end bent to extend below the plane of said base at each side, for the purpose specified.

699,287. BARREL-FORMING MACHINE. JOHN C. C. RICHMOND, Syracuse, N. Y. Filed May 12, 1901. Serial No. 62,003. (No model.)

Claim.—1. In a barrel-forming machine, the combination with segmented sections arranged in cylindrical form and provided with inwardly-projecting bearing-blocks, springs connecting the sections of the cylinder

and causing their energy to draw them toward each other, a suitable screw-shaft, a sleeve loosely mounted upon said screw-shaft and provided with fixed cones, the bases of which project in the same direction and which have a screw-threaded connection with said shaft, and means for rotating the sleeve to move said cones longitudinally upon said shaft to spread the sections of the cylinder, substantially as set forth.

2. In a barrel-forming machine, the combination with segmented sections arranged in cylindrical form, a shaft, bearing-posts for supporting said shaft, said shaft having a screwable connection with one of said bearing-posts, bearing-blocks projecting inwardly from the cylinder-sections, a sleeve loosely mounted upon said shaft and provided with fixed cones adapted to engage the bearing-blocks and spread said sections, one end of said sleeve being provided with a hand-wheel by means of which the sleeve may be rotated, and springs connecting the cylinder-sections and causing their energy to draw them toward each other, substantially as set forth.

699,288. CHIEF'S RATING-APPROX. RUTHA J. REED, Brooklyn, N. Y. Filed Oct. 20, 1901. Serial No. 60,000. (No model.)

Claim.—An apron made from a single blank fashioned to form a body portion and integral sleeve-sections said blank having incisions at the junction of the front portion with the under side of the sleeve-sections and the upper edges of a portion of the sleeve-sections being cut in curved lines and the outer extremities thereof adapted to be joined to the lower edges of the incised portions to form a deeply-cut opening to the sleeve, said blank fashioned with a neck-opening and tabs adapted to enclose the neck.

699,289. RAILWAY SYSTEM. JOHN R. REED, Boston, Mass. Filed July 24, 1901. Renewed Nov. 20, 1900. Serial No. 57,510. (No model.)

Claim.—1. In a structural support for railway systems, the rails and base-supports for each rail, combined with drain-chutes located at the union of the rails and forming supports for the rails and base-supports, and which drain-chutes extend outwardly upon opposite sides of the rail, substantially as described.

2. The herein-described drain-chute, adapted to be located to the under side of the base-support *a*, and consisting of a bottom *c* and sides *d*, *e*, *f*, *g* at each end thereof, the perforated plate *h*, at one end of the chute and the recess *i* for the reception of the base-support *a*, substantially as, and for the purpose, above described.

699,240. SPOCKET-WHEEL FOR RAILROAD LOWE RABY, Lawrence, Kan. Filed July 20, 1901. Serial No. 69,092. (No model.)

Claim.—1. A compensating device for gear-wheels, comprising a peripheral compensating plate having openings spaced apart for the teeth of the wheel, and flanges securing the compensating plate to the wheel.

2. A compensating device for gear-wheels comprising a peripheral compensating plate, having openings spaced apart for the teeth of said wheel, flanges extending downwardly from the compensating plate upon the opposite surfaces of the rim of said wheel, and means for securing said flanges to said wheel.

3. A compensating device for gear-wheels comprising a compensating plate upon the periphery of the wheel and an attachment therefor on the inner side of the rim of said wheel.

4. A compensating device for gear-wheels comprising a compensating plate having openings spaced apart for the teeth of said wheel, and flanges upon each side of said compensating plate extending downwardly upon opposite surfaces of the rim of said wheel, and car-plates upon said flanges and means for securing said car-plates to each other.

5. A compensating device for gear-wheels comprising a compensating plate having openings spaced apart for the teeth of said wheel, flanges upon each side of said compensating plate, extending downwardly upon the opposite surfaces of the rim of said wheel, and car-plates connected with said flanges, and extending beyond the end of said compensating plate, and a securing device for said cars.

699,241. ENGINE. LEVI HANSEN, Crawfordville, Ind. Filed Oct. 23, 1901. Serial No. 70,616. (No model.)

Claim.—1. A rotary engine comprising a casing having a major and a minor cylinder which communicate, a cylindrical abutment in the minor cylinder and projecting into the major cylinder, said abutment having a longitudinal radial groove, a cylindrical piston in the major cylinder having a longitudinal radial groove, a cylindrical piston in the minor cylinder having a longitudinal radial groove, and means connected with the pistons for effecting the closing of the jaws and means carried by the holder adapted to detachably secure the other end of said strip of shoveling material for the purpose specified.

2. A rotary engine comprising a casing having two cylinders therein which communicate, a rotary abutment in one cylinder having a longitudinal radial groove, a cylindrical piston in the other cylinder in peripheral contact with the abutment and having a longitudinally-extending head connecting with the wall of its cylinder and adapted to mesh with the groove of the abutment, separate steam-chests, separate exhausts, a steam-supply, a valve for connecting the chests with the supply interchangeably, and means connected with the said valve for closing the exhaust interchangeably.

699,242. AIR-RAIL-TOOL. WILLIAM E. ROBERTSON, Elkhart, Ind. Filed Aug. 20, 1901. Serial No. 72,304. (No model.)

Claim.—1. In a device of the character described, the combination with a holder, of a pair of clamping-jaws carried thereby and adapted to detachably clamp one end of a strip of shoveling material and means adapted to detachably secure the other end of said strip of material, as and for the purpose set forth.

2. In a device of the character described, the combination with a holder, of a pair of clamping-jaws carried thereby and adapted to detachably clamp one end of a strip of shoveling material, means carried by the holder adapted to operate upon said jaws to open them and means carried by the holder adapted to detachably secure the other end of said strip of material, for the purpose set forth.

3. In a device of the character described, the combination with a holder, of a pair of clamping-jaws carried thereby, an operating-lever carried by the holder, a pin carried by the lever and connected with one of the clamping-jaws and the inner end of said pin being adapted to operate upon the other clamping-jaw when the operating-lever is depressed whereby to cause the jaws to open to receive one end of a strip of shoveling material and means carried by the holder adapted to detachably secure the opposite end of said strip of material for the purpose set forth.

4. In a device of the character described, the combination with a holder, a pair of clamping-jaws carried thereby, an operating-lever carried by the holder, a pin carried by said lever and connected at its inner end with one of said clamping-jaws, said pin being adapted to also operate upon the other jaw when the operating-lever is depressed whereby to cause the jaws to open to receive one end of a strip of shoveling material, a spring connected at one end to one of said jaws and having its other end of the pin to normally force the jaws in a direction to effect the closing of the jaws and means carried by the holder adapted to detachably secure the other end of said strip of shoveling material for the purpose specified.

699,243. HAND-OUTTER AND FEEDER FOR THRESHING-MACHINE. JOHN J. RAY, Wagonville, Ind. Filed Aug. 2, 1902. Serial No. 25,002. (No model.)

Claim.—1. A hand-outting and feeding attachment for threshing-machine comprising a frame having means to detachably secure it to the

feed end of a threshing-machine, the sides of the said frame having their upper edges inclined, an inclined reciprocating feed-pan having guide-bars 11 on its sides, said guide-bars bearing on the inclined upper edges of the sides of the frame, whereby said feed-pan is guided in a right line and supported by said frame, the latter having a cover over the inner portion of said feed-pan, and said feed-pan having its outer uncurved portion formed into a hopper, a reversible hand-cutting and feeding cylinder disposed transversely over said feed-pan, near the discharge of the hopper thereof, and under the cover of said frame, a power-shaft journaled in bearings on said frame, connections between said power-shaft and said hand-cutting cylinder to drive the latter, connections on said power-shaft and means connecting said connections to said feed-pan, substantially as described.

2. A hand-cutting and feeding attachment for threshing-machines comprising a frame having means to detachably secure it to the feed end of a threshing-machine, an inclined reciprocating pan guided in a right line and supported solely by said frame, the latter having a cover over the inner portion of said feed-pan and said feed-pan having its outer uncurved portion formed into a hopper, a reversible hand-cutting and feeding cylinder disposed transversely over said feed-pan, near the discharge of the hopper thereof, and under the cover of said frame, a power-shaft journaled in bearings on said frame, connections between said power-shaft and said hand-cutting cylinder, to drive the latter and connections between said power-shaft and said feed-pan, whereby the latter is reciprocated, substantially as described.

699,244. MACHINE FOR TESTING CANS. WILLIAM BERRY, South Omaha, Neb. Filed Oct. 5, 1901. Serial No. 71,006. (No model.)

Claim.—1. In a can-testing machine, the combination with a suitable frame, of an endless conveyor-chain, sprocket-wheels carrying the same, can-holders secured to the chain at suitable intervals and each provided with can-clamping means, clamp-opening means carried thereby, a tank for containing a testing liquid, a track descending into said tank, means on said chain engaging said tank for guiding the chain and its can-holders into the tank, whereby the cans carried will be immersed in the testing liquid, means for operating said clamp-opening means for tightening the clamp, means on said frame for operating said clamp-opening means when in one position for releasing the same at one point in the machine, and means on the frame for operating said clamp-opening means when in another position at another point in the machine, substantially as described.

2. In a machine of the character described, the combination with a suitable frame, of endless carrying means supported thereon, can-holders provided with clamping means attached to said endless carrier, clamp-opening means carried thereby, means for automatically releasing said clamping means at one point in the machine, when the clamp-opening means is in one position, and means for automatically releasing said clamp-opening means at a different point in the machine when the clamping means is in another position, substantially as described.

3. A can-testing machine, comprising a carrier-chain, can-holders applied thereto at suitable intervals, each comprising a frame portion having a yielding pad on one side and a movable disk on the other side for clamping a can in position, a cam for operating the movable disk, an arm carried by said cam and adjustable thereon and means arranged at various points in the machine designed to estimate said arm according to its position for operating said cam at any one of said points, substantially as described.

4. A can-testing machine, comprising a conveyor-chain, can-holders secured thereto, comprising U-shaped frames, a central perforated elastic disk on one upright of said holder for receiving the open end of the can, a shaft on the other standard of the holder, a movable disk carried

by the shaft for pressing the can against the elastic disk, a cam engaging the end of said shaft for forcing the movable disk against the can, means carried by the cam for being operated to effect the release of the disk again when the can is to be discharged, and means for admitting compressed air to the cans while in the holders and retaining it therein, substantially as described.

5. A can-testing machine, comprising a traveling conveyor, a series of can-holders applied thereto, each holder having a standard, a yielding disk, and a movable disk for clamping a can therein, the said movable disk being provided with an operating-cam, guide-chains also carried by the said movable disk, springs for engaging the said cam for normally holding the disk in its outer position, a cam for engaging the operating-cam of the disk, a shaft carrying said cam, and arms on the shaft adapted to engage projections arranged in the machine, whereby the movable disk will be operated to clamp or release a can, substantially as described.

6. A can-testing machine made up of suitable supporting-standards, sprocket-wheels mounted therein, a carrier-chain passing over said sprocket-wheels, can-holders secured to the carrier-chain, a cam mechanism on each carrier for clamping cans in the holders, a shaft for operating said cam mechanism, a laterally-projecting arm rigidly connected to said shaft, and a pivoted arm also secured to said shaft and normally occupying a lateral position with respect to the cans, a projection upon the machine-frame for engaging the fixed arm to estimate the can mechanism for clamping a can in the holder, a projection for engaging the pivoted arm for releasing said holder, the said pivoted arm also affording means whereby the imperfect cans may be discharged at a different point in the machine from the good cans, substantially as described.

7. A can-testing machine, comprising a suitable frame, a traveling conveyor-chain moving therein carrying can-holders, a cam mechanism on each holder for clamping the cans therein, a shaft for operating the said cam, said shaft being provided with a fixed and a pivoted arm normally extending laterally therefrom, a projection on the frame for engaging the fixed arm to clamp the cans in the holders, a projection for engaging the pivoted arm, for releasing the cans from the holders when they are perfect, the said pivoted arm affording means for causing imperfect cans by turning the same so as to estimate with the longitudinal side of the can-shaft, a cam track or lug upon the machine for turning the pivoted arm to its laterally-projecting position, and a second projection on the frame for engaging the said pivoted arm, the structure being such that the imperfect cans will thus be discharged from the machine at a different place from the point where the good cans are discharged, substantially as described.

8. A can-testing machine, comprising a series of can-holders, means for delivering compressed air to the cans when in said holders, comprising

ing a valve mechanism, a plug in said valve mechanism, a star-wheel for operating said plug, and a projection on each can-holder for engaging the star-wheel and turning the same so as to open the valve and close the same again after air has been admitted to the can as the can-holder passes the valve mechanism.

9. A can-testing machine, comprising a series of can-holders, a valve mechanism adapted to be brought in coincidence with said holders, comprising a valve-casing, a plug or valve mounted within the casing and provided with a series of lateral ports, a chain for turning the valve or plug, arms projecting from said chain for actuating the same, the said arms projecting into the path of a rib or lug on the can-holder so that as the can-holder is moved past the valve, the said rib or lug will turn the plug or valve so as to admit compressed air from any suitable source into the can to be tested, the said plug being turned so as to shut off the supply of compressed air when the can-holder is moved away from the valve mechanism, substantially as described.

10. A can-testing machine, comprising a series of can-holders, and a valve mechanism, means for moving the can-holders past the valve mechanism but in very close relation thereto, a valve-plug within the valve-casing formed with a series of ports leading into the hollow interior of said valve or plug, the portions of the plug between said ports being arranged that one of them will normally occupy a position to close the outlet-port of the valve-chamber, and means for turning the plug as each holder passes the valve-casing, whereby compressed air will be admitted to the can in the holder, substantially as described.

699,245. EXPANDING BOLT. EDGAR A. BUNNELL, Wallingford, Conn. Filed Jan. 2, 1902. Serial No. 20,925. (No model.)

Claim.—1. In an expandable bolt, the combination with a longitudinally corrugated and split collar; of a bolt adapted to pass therethrough, and by its engagement therewith to expand said collar.

2. In an expandable bolt, the combination with a split collar having longitudinal corrugations therein; of a bolt adapted to pass therethrough and having a tapered head thereon which engages said collar.

3. In an adjustable bolt, the combination with a collar member slotted longitudinally and having a plurality of longitudinal corrugations therein, said corrugations having inclined faces at one end thereof; of a bolt having a tapered head thereon which engages the inclined faces of the said corrugations.

4. In an adjustable bolt, the combination with a longitudinally-slotted collar member having a plurality of inwardly-projecting corrugations therein, said corrugations having inclined faces upon one end; and a bolt having a tapered head, the angle of which corresponds to the inclined faces of the said corrugations.

5. In an adjustable bolt, the combination with a longitudinally-slotted collar member 1 having a plurality of corrugations 2 therein, one end of said corrugations having inclined faces 4; and a bolt 3 adapted to pass through said collar member and having a tapered head 5 thereon which engages the inclined faces 4.

6. In an adjustable bolt, the combination with a corrugated collar having a slot extending throughout the length thereof and a plurality of slots extending from one end and terminating adjacent to the other end thereof; of a bolt adapted to be surrounded by said collar and by its engagement therewith to expand the same.

7. In an adjustable bolt, the combination with a longitudinally-corrugated collar having a slot extending throughout the length thereof and a plurality of slots extending from one end and terminating adjacent to the other end thereof; of a bolt adapted to be surrounded by said collar and by its engagement therewith to expand the same.

8. In an adjustable bolt, the combination with a longitudinally-corrugated collar having a slot extending throughout the length thereof and a plurality of slots extending from one end and terminating adjacent to the other end thereof; of a bolt adapted to be surrounded by said collar and by its engagement therewith to expand the same.

9. In an adjustable bolt, the combination with a collar member 1 having a plurality of corrugations 2 therein, one end of said corrugations

having inclined faces 4; and a slot 3 extending throughout the length of said collar and slots 10 open at one end and terminating adjacent to the other end thereof; and a bolt 5 adapted to pass through said collar member and having a tapered head 6 thereon which engages the inclined faces 4.

699,246. FENCE-WIRE STRETCHER. BENJAMIN WAGNER, Union, Pa. Filed Dec. 26, 1901. Serial No. 61,677. (No model.)

Claim.—In fence-wire stretchers, a bar having teeth along one side and provided with feet at one end to engage a post; a lever fitted near one end to slide freely longitudinally upon the said bar; two pivots pivoted to the lever at opposite sides of the line of said teeth and each adapted to engage the said teeth, each pivot being formed at one end as a latch, and the two latches being adjacent to each other and adapted to be pressed toward each other to disengage the pivots from the teeth; and hooks freely hung to the lever for engaging wire, substantially as described.

699,247. FERTILIZER DISTRIBUTOR. CHARLES E. SANDERS, Danville, Ala. Filed Oct. 24, 1901. Serial No. 71,252. (No model.)

Claim.—In a fertilizer distributor, the combination with the hopper, a drum having a lag formed integral therewith, lugs pivoted to said hopper and said drum, a tappet device for engaging the lag and moving the drum in one direction, and a spring for supporting one end of the drum for returning it to its normal position after having been moved by the tappet device, substantially as set forth.

699,248. MACHINE FOR BUFFING ARTICLES OF LEATHER. JAMES B. GALT, Boston, Mass., assignor to United Shoe Machinery Company, Paterson, N. J., a Corporation of New Jersey. Original application filed July 14, 1901. Serial No. 61,123. Divided and this application filed July 24, 1902. Serial No. 62,572. (No model.)

Claim.—1. A machine for buffing articles of leather, having, in combination, a flexible roll, a tubular covering of abrasive material, and means for holding the ends of the roll to grip the tubular covering, substantially as described.

2. A machine for buffing articles of leather, having, in combination, a roll provided with a surface concave longitudinally of the roll and a covering of abrasive material supported thereon and bridging the concave surface, substantially as described.

3. A machine for buffing articles of leather, having, in combination, a roll consisting of a plurality of sections and provided with a surface concave longitudinally of the roll, and a tubular covering of abrasive material supported thereon and bridging the concave surface, substantially as described.

4. A machine for buffing articles of leather, having, in combination, a flexible roll provided with a rigid core fixedly secured thereto, a tubular covering of abrasive material and clamping-disks bearing against the ends of the roll to hold the roll at its ends to grip the tubular covering, substantially as described.

5. A machine for buffing articles of leather, having, in combination, a flexible roll, a tubular covering of abrasive material, rotatable sleeves mounted in bearings at each end of the roll, clamping-disks carried by said sleeves arranged to bear against the ends of the roll to hold the roll to grip the tubular covering, and a shaft passing through the sleeves and roll, substantially as described.

699,249. FROST-INSULATING MECHANISM FOR LIQUIDS. DAVID T. SHANLEY, Westchester, Pa. Filed Aug. 4, 1901. Serial No. 71,046. (No model.)

Claim.—1. A frost-regulating mechanism for liquids comprising a chamber having a supply-inlet, a discharge-outlet pipe and an overflow-outlet, and a movable device operated by the overflow from said chamber to vary the communication between the chamber and the discharge-outlet and serving to conduct the overflow indirectly to the latter.

2. A frost-regulating mechanism for liquids comprising a chamber having a supply-inlet, a discharge-outlet pipe and a direct-overflow outlet of less capacity than said discharge-outlet, and a movable conductor for said direct-overflow liquid to said discharge-outlet forming an automatically-operated valve adapted to regulate direct communication between the latter and said chamber.

3. In a frost-regulating mechanism for liquids having a main chamber with a supply-inlet, a discharge-outlet, and an overflow-outlet, and overflow-receiving chamber and a float-valve in said overflow-chamber arranged to automatically regulate direct communication between said discharge-outlet and the main chamber.

4. In a frost-regulating mechanism for liquids having a main chamber with a supply-inlet, a discharge-outlet, and an overflow-outlet, an overflow-receiving chamber and a float-valve in said overflow-chamber communicating with said discharge-outlet and arranged to automatically regulate the direct discharge from said main chamber.

5. In a frost-regulating mechanism for liquids having a main chamber with a supply-inlet, a discharge-outlet, and an overflow-outlet, an overflow-receiving chamber and a float-valve in said overflow-chamber having a tubular depending neck extending said chamber and adapted to rest upon

said discharge-outlet to cut off the latter from direct communication with the main chamber.

6. In a frost-regulating mechanism for liquids having a main chamber with a supply-inlet, a discharge-outlet, and an overflow-outlet, an overflow-receiving chamber and a float-valve in said overflow-chamber having a tubular depending neck passing loosely through said overflow-outlet into the main chamber and adapted to rest upon said discharge-outlet to cut off the latter from direct communication with the main chamber.

699,250. TYPE-WRITING HAMMER. SAMUEL S. BOWEN, Evanston, Ill., assignor to the Union Typewriter Company, Jersey City, N. J., a Corporation of New Jersey. Filed Jan. 11, 1902. Serial No. 704,200. (No model.)

Claim.—1. In a type-writing machine, the combination with the top plate of the main frame and a carriage, of parallel carriage track-rails connected together, and a latch for releasably securing the rails upon the top plate.

2. In a type-writing machine, the combination with the top plate of the main frame and a carriage, of an auxiliary carriage-supporting frame, comprising track-rails united by cross-bars, and a latch for releasably securing said carriage-supporting frame upon said top plate.

3. In a type-writing machine, the combination with the top plate of the main frame and a carriage, of slots in said top plate, front and rear carriage-supporting rails, cross-bars uniting said rails and seated within said slots, and latches co-operating with said slots to releasably secure the carriage-supporting rails upon said top plate.

4. In a type-writing machine, the combination with the top plate of the main frame having long slots therein, of the front and rear carriage-supporting rails, cross-bars uniting said rails and cutting within the slots of the top plate and provided each with a side slot or groove, and thumb-screws having arms to engage said slots or grooves for detachably locking said cross-bars to the top plate.

5. In a type-writing machine, the combination with a main frame and a paper-carriage, of front and rear carriage-supporting rails, cross-bars uniting said rails, and means for adjusting one of said rails independently of the other on said cross-bars, said adjusting means being independent of the main frame.

6. In a type-writing machine, the combination with a main frame and a paper-carriage, of front and rear carriage-supporting rails, one of said rails being interlocked with said cross-bars, and means at the end of said cross-bars and independent of the main frame for adjusting said interlocked rail relatively to the other rail, each of said cross-bars extending longitudinally of its cross-bar and having a bearing thereon and also having a bearing upon the movable rail, for drawing the latter toward the other rail.

7. In a type-writing machine, the combination with the top plate of the main frame, of parallel carriage track-rails connected together and

detachably connected with said top plate and having roller-bearings and one of said rails being adjustable toward and from the other rail, a carriage having roller-bearings, and rollers interposed between said rail and carriage-bearings, said connected carriage track-rails and carriage being removable as a whole.

8. In a type-writing machine, the combination with the paper-carriage provided with a rack-bar, of a carriage-driving gear-wheel engaging said rack-bar, a carriage-advancing spring connected with said gear-wheel, an escapement mechanism, a suitable clutch between said escapement mechanism and the gear-wheel and means for shifting said clutch.

9. In a type-writing machine, the combination with the paper-carriage provided with a rack-bar, of a carriage-driving gear-wheel engaging said rack-bar and provided with clutch-teeth, a carriage-advancing spring connected with said gear-wheel, a movable clutch provided with teeth or notches to engage the clutch-teeth of the gear-wheel and means for shifting said clutch to separate the clutch-teeth in order to permit the carriage to be moved independent of the escapement mechanism.

10. In a type-writing machine, the combination with a paper-carriage provided with a rack-bar, of a carriage-driving gear-wheel engaging said rack-bar and provided with clutch-teeth, a carriage-advancing spring, a movable clutch provided with teeth or notches to engage the clutch-teeth of the gear-wheel, means for shifting said clutch to separate the clutch-teeth in order to permit the carriage to be moved independent of the escapement mechanism, and a finger-piece suitably connected with said means for shifting said clutch.

11. In a type-writing machine, the combination with a paper-carriage provided with a rack-bar, of a carriage-driving gear-wheel engaging said rack-bar, a shaft whereon said gear-wheel is mounted, a carriage-advancing spring connected to said gear-wheel, a clutch-wheel and two series of clutch-teeth one suited with the gear-wheel and the other with the clutch-wheel, a shifter engaging said clutch-wheel and means for operating said shifter from the paper-carriage.

12. In a type-writing machine, the combination with a paper-carriage provided with a rack-bar, of a carriage-driving gear-wheel having teeth upon its periphery to engage said rack-bar and having axially-arranged clutch-teeth, a clutch-wheel mounted concentrically with said gear-wheel and having axially-arranged clutch-teeth, a spring for forcing the clutch-wheel toward the gear-wheel, a shifter engaging the clutch-wheel to throw it out of action and suitable means connected with said shifter whereby it may be manually operated.

13. In a type-writing machine, the combination with a paper-carriage provided with a rack-bar, of a carriage-driving gear-wheel engaging said rack-bar, a shaft extending through said gear-wheel, a carriage-advancing convolute spring controlling said shaft and connected to said gear-wheel, a sliding clutch-wheel mounted concentrically with the gear-wheel, and provided with a peripheral groove, clutch-teeth arranged intermediate said clutch and said gear-wheel and whereby the two may be connected for motion movement, a ratchet-wheel mounted concentrically with the clutch-wheel, suitable escape-degs for the escape of said ratchet-wheel, a shifter engaging the peripheral groove of the clutch-wheel and means for operating said shifter to disengage the clutch-wheel from the gear-wheel.

14. In a type-writing machine, the combination with a paper-carriage provided with a rack-bar, of a cup-shaped gear-wheel engaging said rack-bar, a convolute carriage-advancing spring within said gear-wheel and connected thereto, a shiftable clutch-wheel adapted to engage said gear-wheel, a ratchet-wheel connected with said clutch-wheel, suitable escape-degs for engaging said ratchet-wheel and shifting mechanism whereby said clutch-wheel is disengaged from said gear-wheel.

15. In a type-writing machine, the combination with a paper-carriage provided with a rack-bar, of a carriage-driving gear-wheel engaging said rack-bar, an escapement mechanism, a clutch-wheel connected with said escapement mechanism and provided with means for engaging the gear-wheel, a shifter for operating said clutch-wheel to disengage it from the gear-wheel, a release-key upon the paper-carriage and suitable means intermediate said release-key and said shifter whereby the shifter may be operated by the release-key on the paper-carriage.

16. In a type-writing machine, the combination with the paper-carriage provided with a rack-bar, of a gear-wheel engaging said rack-bar, a clutch-wheel mounted concentrically with said gear-wheel and free to slide toward and from the same, an escapement mechanism connected with said clutch-wheel, two series of bevel clutch-teeth between said clutch-wheel and said gear-wheel, a shifter engaging the periphery of said clutch-wheel, a shifting-rod mounted upon the main carriage and connected with said shifter and a release-key mounted upon the main carriage and having connected therewith a part extending in position to operate said shift-rod.

17. In a type-writing machine, the combination with a paper-carriage provided with a rack-bar, of a gear-wheel engaging said rack-bar, a clutch-wheel mounted concentrically with said gear-wheel and movable toward and from the same, a ratchet-wheel also mounted concentrically

with said clutch-wheel, suitable escapement-degs for engaging said ratchet-wheel, interlocking clutch-teeth arranged between said gear-wheel and said clutch-wheel, a pivoted shifter engaging the periphery of said clutch-wheel, rods extending beneath the top plate of the main frame and connected to said shifter, a shift-rod arranged above the top plate of the main frame and connected to said rods beneath the top plate, a release-key mounted upon the paper-carriage and suitable connections whereby said release-key will operate said shift-rod irrespective of the position of the carriage.

18. In a type-writing machine, the combination of component-controlled carriage-driving mechanism having a clutch, a carriage, a transverse rod or ball movably connected to the main frame and extending parallel with the line of travel of the carriage, a shifting rod or ball pivotally connected with the carriage and adapted to actuate said transverse rod or ball in all positions of the carriage, and connections between the transverse rod or ball-frame ball and the clutch for disengaging the latter.

19. In a type-writing machine, the combination of component-controlled carriage-driving mechanism having a clutch, a carriage, a transverse rod movably connected to the main frame and extending parallel with the line of travel of the carriage, a shifting rod or ball pivotally connected to the carriage and adapted to actuate the transverse rod in all positions of the carriage, a key for actuating said shifting-rod, and connections intermediate the transverse rod and the clutch for disengaging the clutch.

20. In a type-writing machine, the combination of an escapement-controlled carriage-driving mechanism having a clutch provided with a peripheral groove, a carriage, a frame pivotally hung to the main frame and provided with arms engaging said peripheral groove at opposite sides thereof, rods engaging said frame at opposite sides of the clutch and extending forwardly of the machine, a transverse rod connecting the forwardly-extending rods and extending parallel with the line of travel of the carriage, and means on the carriage adapted to coast with the transverse rod in all positions of the carriage to shift the pivoted frame to open the clutch.

21. In a type-writing machine, the combination of a spring-driven, a carriage connected with the drum, an escapement-wheel, a clutch intermediate said escapement-wheel and drum and provided with a peripheral groove, a frame H bowed around the clutch and pivoted to the main frame and provided with arms engaging said peripheral groove at opposite sides, rods 37 connected with the frame H at opposite sides of the clutch and extending forwardly, a rod 38 connecting said rods 37 and extending parallel with the path of travel of the carriage, and means on the carriage adapted to actuate the rod 38 in all positions of the carriage to disengage the clutch, with a spring for closing said clutch.

22. In a type-writing machine, the combination of component-controlled carriage-driving mechanism having a clutch, a carriage, a rod 40 pivotally connected by arms or levers of the carriage and extending across the carriage parallel with the line of travel thereof, a rod 39 parallel with the rod 40 and movably mounted on the main frame and adapted to be actuated by rod 40 in all positions of the carriage, and connections intermediate said rod 39 and the clutch for operating the latter.

23. In a type-writing machine, the combination of component-controlled carriage-driving mechanism having a spring-pressed clutch, a carriage, a rod 40 extending across the carriage parallel with the path of travel thereof and pivotally connected by arms to the carriage, a rod 39 above the top plate of the main frame and adapted to be operated by the rod 40 in all positions of the carriage, movable rods 37 at each side of the center of the machine and guided below the top plate and carrying the rod 39, and connections intermediate said rods 37 and the clutch for operating the latter.

24. In a type-writing machine, the combination with a paper-carriage provided with a rack-bar, of a gear-wheel engaging said rack-bar, a shaft whereon said gear-wheel is mounted, a convolute carriage-advancing spring connected to said shaft and to said gear-wheel, a clutch-wheel and a ratchet-wheel through both of which said shaft extends, a handle connected to said shaft whereby the tension of said spring may be varied, a spring for forcing the clutch-wheel into normal engagement with the gear-wheel and a shifter whereby the clutch-wheel may be disengaged from the gear-wheel.

25. In a type-writing machine, the combination with an escapement ratchet-wheel, of fixed and sliding escape-degs, a vibratory frame upon the top of which said escape-degs are mounted, the latter being pivotally supported and being provided with projecting wings and set-screws whereby the extent of its pivotal movement is determined.

26. In a type-writing machine, the combination of a vibratory frame, a holding-day, means for covering the day rigidly to the frame, horizontally-extending wings on the day and adapted to rest on the top of the frame, a leg on said wing portion, a spring-pressed foot-day pivoted between said leg and holding-day and provided with horizontally-extending arms, and adjusting-screws engaging threaded holes in said arms

and adapted to coast with the top of the wing portion to limit the motion of the foot-day.

27. In a type-writing machine, the combination with the paper-carriage, of a margin stop-bar at the rear of said carriage, a right-hand margin-stop mounted upon said margin stop-bar and provided at its inner end with a pawl, a sliding stop-arm arranged in the path of said pawl, and a shifting-rod connected with said sliding stop-arm and extending to the front of the machine.

28. In a type-writing machine, the combination of a carriage, a bell, a bell-striker, a carriage-stop on the framework, a pivoted trip-arm on the carriage adapted to operate the bell-striker and to coast with the carriage-stop to arrest the carriage, and means for moving said carriage-stop out of the path of said trip to permit the further advance of the carriage.

29. In a type-writing machine, the combination with the main paper-carriage, of a supplemental platen-carriage comprising a frame located beneath the main carriage and sliding bar connected to said frame located above the main carriage, and a platen supported by said sliding bar, said sliding bar and frame being connected together and mounted to move at right angles to the line of travel of the main carriage and said frame located beneath the main carriage comprising a pair of rigidly-joined and bars.

30. In a type-writing machine, the combination with the main paper-carriage, of a supplemental platen-frame comprising a U-shaped frame made in one piece and mounted beneath the main carriage, sliding bars mounted above said main carriage and connected to said U-shaped frame at its ends, and antifriction-balls interposed between said sliding bars and said paper-carriage.

31. In a type-writing machine, the combination with the main paper-carriage having its end bars clotted, of a supplemental platen-carriage comprising a frame located beneath the main carriage, sliding bars located above the end bars of the main carriage and attached through said slots to the frame beneath the carriage, and a plate or bar extending above the carriage and connecting the front ends of said sliding bars.

32. In a type-writing machine, the combination with the main carriage and with the supplemental platen-carriage mounted thereon and having a scale-plate at its front, of an indicator-pointer connected to the main frame in front of said main carriage and extending over the scale-plate of the supplemental carriage, said indicator-pointer being provided with an leverly-extending fixed supplemental pointer P, which is in proximity to the printing-point upon the platen when the supplemental platen-carriage is turned upward to expose the line of printing.

33. In a type-writing machine, the combination with a platen, of a platen-frame and a carriage, said platen-frame being mounted upon posts or brackets, and said posts or brackets having seats upon said carriage and being releasably held upon said seats by means of latches.

34. In a type-writing machine, the combination with a platen, of a platen-frame and a carriage, said platen-frame being pivotally connected with posts or brackets, which have seats upon said carriage and are releasably held upon said seats by means of latches.

35. In a type-writing machine, the combination with a platen, of a platen-frame and a carriage, said platen-frame being pivotally connected with posts or brackets which have seats upon the end bars of the carriage and are releasably held upon said seats by means of latches.

36. In a type-writing machine, the combination with the main paper-carriage and with the supplemental platen-carriage mounted thereon, of a platen, a supporting-frame for said platen, and suitable posts in pivotal connection with said platen-supporting frame, said posts being detachably connected to the end bars of the supplemental platen-carriage.

37. In a type-writing machine, the combination with the main carriage and with the supplemental carriage mounted thereon, of legs projecting from the end bars of the supplemental carriage, platen-supporting posts resting upon said end bars and engaging said legs, and spring-actuated latching bars or levers for detachably fastening said platen-supporting posts to the end bars of the supplemental carriage.

38. In a type-writing machine, the combination with the main paper-carriage and with the supplemental platen-carriage mounted thereon, of dovetailed legs or studs rising from the end bars of said supplemental carriage, the platen-supporting posts and bases provided with dovetailed portions to engage said legs or studs, a platen and a supporting-frame for said platen pivotally connected with said platen-supporting posts.

39. In a type-writing machine, the combination with the carriage mechanism, of platen-supporting posts or brackets detachably connected with the carriage mechanism, and spring-actuated latching-plungers for holding said platen-supporting posts or brackets in position.

40. In a type-writing machine, the combination with the carriage mechanism and with the platen and its supporting-frame, of supporting posts or brackets, arms at the ends of said supporting-frame and in rigid connection therewith, pivot-links connecting said arms with the tops of the supporting posts or brackets, and links whereby said supporting-frame is pivotally connected at points in front of said posts or brackets.

41. In a type-writing machine, the combination with the carriage mechanism and with the platen and a supporting-frame for said platen, of supporting posts or brackets located at the ends of said platen-frame and having forwardly-extending base portions, arms in rigid connection with said platen-supporting frame, links pivotally connecting said arms to the tops of the supporting posts or brackets, and pivot-links connecting the supporting-frame with the bases of said supporting posts or brackets.

42. In a type-writing machine and in a platen-shifting mechanism, the combination of a carriage provided with open seats or bearings for the platen-shaft, a platen, a platen-shaft, a frame in which said shaft is journaled, links pivotally connected with said shaft and with the carriage in front of said seats or bearings, arms on the platen-supporting frame and extending or standing normally over the platen-shaft, and links pivotally connected with said arms and with said carriage in rear of said seats and above the said seats.

43. In a type-writing machine and in a platen-shifting mechanism, the combination of a platen-frame, a platen journaled in said frame, arms connected to the ends of the platen-frame, links 130 pivotally connected at one end to a relatively stationary part of the carriage and at the other end to the platen-frame arms, and links 135 each pivotally connected at one end to a relatively fixed part on the carriage and at the other end to the platen shaft or axle, said links 130 and 135 being at opposite sides of the shaft or axle, and adapted to control the platen in its turning up and turning down movements.

44. In a type-writing machine and in a platen-shifting mechanism, the combination of a platen-frame, a platen, a platen-axle, a base-plate at each end of the platen having an open bearing for the platen-axle, a post or bracket extending upwardly from each base-plate, a link for connecting each post or bracket with the platen-frame, and a second link for each base-plate and pivotally connected to its base-plate and to the platen shaft or axle.

45. In a type-writing machine, the combination of a carriage, a platen-frame, a platen, a platen-axle, a base-plate at each end of the platen having an open bearing for the platen-axle and detachably connected with the carriage, a post or bracket extending upwardly from each base-plate, a link for and connecting each post or bracket with the platen-frame, and a second link for each of said base-plates and pivotally connected thereto and to the platen axle or shaft.

46. In a type-writing machine, the combination of a carriage having seats in its end bars, a platen-frame, a platen, a platen-axle, base-plates each having an open bearing for the platen-axle and adapted to the seats in the carriage, means for holding said base-plates detachably in said seats, a post or bracket extending upwardly from each base-plate, a link for and connecting each of said posts or brackets with the platen-frame, and a link for and connecting each base-plate and the platen shaft or axle.

47. In a type-writing machine, the combination of a platen-frame, a platen journaled in said frame, arms connected to the ends of the platen-frame, links 130 pivotally connected at one end to a relatively stationary part of the carriage, and one of said links being provided with a hole or indentation, a spring-pressed leveled pin on the corresponding stationary part of the carriage and adapted to engage said hole to offer a resistance to the turning down of the platen, and links 135 pivotally connected to a relatively fixed part of the carriage and to the platen shaft or axle, said links 130 and 135 being on opposite sides of the said shaft or axle.

48. In a type-writing machine, the combination with the detachable main paper-carriage and with the supplemental paper-carriage mounted to move transversely thereof, of a shifting-bar extending longitudinally beneath the main paper-carriage, a part extending from said supplemental carriage in position to be engaged by said shifting-bar, a latch for locking said main and supplemental carriages together, means for releasing said latch located in the path of the shifting-bar and adapted to be operated by said bar during its initial movement, and key-lever mechanism whereby said shifting-bar is manually operated, the construction and arrangement being such that the main paper-carriage, together with the supplemental paper-carriage, may be detached from the machine and from said shifting-bar, and such that when said carriages are in place upon the machine, said shifting-bar operates to automatically release the latch and shift said supplemental carriage.

49. In a type-writing machine, the combination with the main carriage and with the supplemental carriage mounted thereon, of a latch connecting said main and supplemental carriages, a pivoted release-arm for said latch, a shifting-bar extending longitudinally beneath the carriage at its rear and adapted to coast with a part depending from the supplemental carriage, said release-arm being located intermediate the shifting-bar and the depending part of the supplemental carriage, whereby the initial movement of said shifting-bar shall disconnect the carriage to permit the supplemental carriage to be shifted.

50. In a type-writing machine, the combination of a main carriage, a latch-plate pivoted thereon, a shifting platen-frame provided with a perforation to receive said latch-plate to lock the frame and carriage together, a release-arm adapted to operate and release the latch and pivoted on the

platen-frame, a shift-bar and a projecting part on the platen-frame for co-action with the shift-bar and relatively further from the shift-bar than said release-arm whereby the platen-frame is first unlocked and then shifted by a single movement of the shift-bar.

51. In a type-writing machine, the combination of a main carriage, a shifting platen-frame thereon provided with a perforation, a gravity-latch device on the main carriage adapted to coast with said perforated part on the platen-frame, a curved arm pivoted to the platen-frame and provided with an upright portion adapted to engage said latch device, a depending part on the platen-frame adapted to coast with the shift-bar, said shift-bar, depending part and curved release-arm being relatively arranged so that the shift-bar first operates the release-arm and then shifts the platen-frame by a single movement of the shift-bar.

52. In a type-writing machine, the combination of a main carriage, a platen-frame having a part extending under a bar of said main carriage, a perforation in said under part, latch-plate 151 having a tongue 152 adapted to engage said perforation to lock the frame and carriage together, a curved release-arm 153 provided with a stop-shoulder 154 adapted to coast with a part of the platen-frame to limit the downward motion of the curved arm, rollers 155 on the platen-frame, and a shift-bar, said shift-bar, arm 153 and rollers 155 being relatively arranged so that the shift-bar operates the release-arm to release the platen-frame and then coasts with the rollers 155 to shift the platen-frame by a single movement.

53. In a type-writing machine, the combination of a main carriage, a shifting platen-frame provided with a perforation, a pivoted latch-plate on the main carriage adapted to descend to engage said perforation, independently-pivoted means for lifting said latch-plate to disengage the shifting platen-frame, and a stop to limit the upward motion of the latch-plate.

54. In a type-writing machine, the combination with the carriage mechanism, of a platen-supporting frame pivotally mounted thereon to permit the platen to be operated to expose the line of print, a projection extending forwardly from said platen-supporting frame, a pivoted latch for engaging said projection to hold the platen-supporting frame in working position, a shoulder or offset connected with said latch, and a pivoted lever whereby said platen-supporting frame is tilted, said pivoted lever having a projection adapted to engage said shoulder or offset and release the latch during the initial movement of the lever.

55. In a type-writing machine, the combination with the platen and with the front bar of its supporting-frame, of a pressure-roll, a sliding block mounted upon said front bar and carrying said pressure-roll, and a spring-finger extending diagonally downwardly and inwardly from the upper part of said pressure-block and beneath the platen.

56. In a type-writing machine, the combination with the platen and its supporting-frame, of a clove mounted upon the back end of the platen-supporting frame, journal-arms connected to said clove, a shaft connected to said journal-arms and having one or more pressure-rolls mounted thereon, a spring for forcing said pressure-rolls toward the platen and a releasing-arm connected with said clove and serving to move the back pressure-roll or rolls away from the platen.

57. In a type-writing machine, the combination with the platen and its supporting-frame, of a clove mounted upon the back end of said supporting-frame, journal-arms connected to said clove, a shaft carried by said journal-arms and provided with one or more pressure-rolls, a poppet-rod connected to said clove, springs for forcing said pressure-roll or rolls and said table toward the platen, and a releasing-arm connected with said clove whereby said pressure-roll and said table may be simultaneously moved away from said platen.

58. In a type-writing machine, the combination of a platen, a back rod on the platen-carrier, a clove rotatably mounted on said rod, downwardly-extending arm rigid with said clove, pressure-rolls supported by said arm, a spring-pressed paper-table having the same axis of motion as said clove, upwardly-extending arm rigid with said clove and adapted to coast with the back of the upper portion of said table, and a lever rigidly connected for operating said clove and arm, whereby the pressure-rolls and table may be simultaneously moved away from the platen by a single movement of said lever.

59. In a type-writing machine, the combination with the main paper-carriage, the supplemental carriage and the platen supported thereby, of upper-can key-lever mechanism for said supplemental carriage comprising a shift-rod adapted to move backward and supplemental carriage, an upper-can key-lever connected with said shift-rod, a supplemental key pivotally mounted upon said key-lever at its front, and a pivoted latch-bar connected to said supplemental key-lever and having a part adapted to engage a fixed part of the main frame in order to retain the upper-can key-lever in depressed position.

60. In a type-writing machine, the combination of a shifting platen-carrier, a platen-shifting key-lever, connection between said lever and platen-carrier, a supplemental key pivoted to said key-lever, an angular

latch-plate pivoted to said key-lever and connected with the supplemental key, and a fixed part of the main frame with which said latch-plate is adapted to engage when the supplemental key is used to depress the key-lever and shift the platen, thereby locking the platen in shifted position.

61. In a type-writing machine, the combination of a shifting platen-carrier, a key-lever connected with the platen-carrier for shifting the main, a supplemental key pivoted to said key-lever, an angular latch-plate 201 pivoted at one end to the said key-lever and oppositely connected at the other end with said supplemental key and provided with an upright notched end, and a lug or bar 202 on the main frame adapted to coast with said latch-plate and to retain the shifting key-lever in depressed position.

62. In a type-writing machine, the combination with the platen and its supporting-frame and with the ratchet-wheel at the end of said platen, of a head including said ratchet-wheel, a line-space lever pivotally connected to said supporting-frame, a fixed-pawl pivoted to said line-space lever and adapted to engage said ratchet-wheel, and a locking-pawl located within said head and having an arm extending into position to be engaged by said fixed-pawl in order to cause said locking-pawl to arrest the ratchet-wheel.

63. In a type-writing machine, the combination with the platen and its supporting-frame and with the ratchet-wheel at the end of said platen, of a line-space lever pivotally connected to said supporting-frame and provided at one end with a series of steps or notches, a fixed-pawl pivotally connected with said line-space lever and extending into position to engage the ratchet-wheel, and a line-space regulator having an arm arranged to engage either of the steps or notches of the line-space lever to limit its return movements, and means for holding said line-space regulator in either of several positions.

64. In a type-writing machine, the combination of a platen, a line-space ratchet-wheel thereon, a line-space lever, a pawl pivotally connected with said lever and extending into position to engage the ratchet-wheel, a pivoted line-space regulator provided with an arm adapted to engage said line-space lever to control the throw thereof and provided with an offset adapted to coast with a part on said pawl to lift the same from engagement with said ratchet-wheel on the return motion of the line-space lever.

65. In a type-writing machine, the combination of a platen having the printing-point at the under side thereof, a ratchet-wheel on end of less diameter than the platen, a platen-frame in which the platen is journaled, a head on the frame end of the same diameter as the platen and including said ratchet-wheel and provided with an opening at the upper side thereof, a line-space lever pivoted to the platen-frame below the platen-axis, a line-fixed pawl pivotally connected with said lever, and offset to extend through the opening in the head, and a line-space regulator-lever pivoted to the platen-frame and having an arm adapted to engage the end of the line-space lever to vary the throw thereof and also having an offset portion to engage the said line-fixed pawl to lift the same from the ratchet-wheel on the return of the line-fixed lever.

66. In a type-writing machine, the combination of a platen-frame, a platen journaled therein and provided at one end with a ratchet-wheel of less diameter than the platen, a head of the same diameter as and concentric with the platen and connected with the platen-frame and surrounding said ratchet-wheel and provided with an opening therein, a line-space lever pivoted to said frame, an offset line-fixed pawl extending through said opening to engage the ratchet, and a locking-dog pivoted within said head and normally disengaged from the ratchet-wheel and adapted to be thrown into locking engagement therewith by the line-fixed pawl as the latter completes its movement.

67. In a type-writing machine, the combination of a platen-frame, a platen journaled in said frame, a bent lever pivoted between its ends to said frame and having one end extending rearwardly, a line-fixed pawl pivotally connected with said lever toward the other end thereof and extending rearwardly, a ratchet-wheel on said platen, and a line-space regulator-lever pivoted between its ends to the platen-frame and having an offset or arm adapted to engage the said pawl to lift the same from the ratchet-wheel in all positions of the regulator and adapted to coast with the rearwardly-extending end of the line-fixed lever to regulate or vary the throw thereof.

68. In a type-writing machine, the combination with the top plate of the main frame, and a carriage, of parallel carriage track-rolls connected together and forming a frame, rods upon said top plate for said roll-frame, and a latch or lock for releasably securing said roll-frame upon said top plate.

69. In a type-writing machine, the combination with the top plate of the main frame, and a carriage, of slots in said top plate, legs 5 and 6, front and rear carriage-supporting rails, cross-bars uniting said rails and seated within said slots and resting upon said legs, and latches co-operating with said slots and legs to releasably secure the carriage-supporting rails upon said top plate.

699,251. WELLSBACH OR OTHER INCANDESCENT BURNER.
VINCE H. WELLSBACH, Philadelphia, Pa. Filed Nov. 14, 1891. Serial No. 82,178. (No model.)

Claim.—1. In an incandescent burner, the combination of a burner mixing-tube having an internal annular shoulder, a member adapted for communication with a gas-supply connection and with said burner mixing-tube and having a valve-seat that projects into the burner mixing-tube, and a needle-valve superimposed in said burner mixing-tube and adapted to said valve-seat and acting when open to direct the gas-jet against said shoulder, substantially as described.

2. In an incandescent burner, the combination of a burner mixing-tube having an internal annular shoulder, a tubular member detachably fitted in said burner mixing-tube arranged for attachment to a gas-supply connection and having a valve-seat, and a needle-valve superimposed in said burner mixing-tube adapted to said valve-seat, and acting when open to direct the gas-jet against said shoulder, substantially as described.

3. In an incandescent burner, the combination of a burner mixing-tube having an internal annular shoulder, a member detachably fitted in said burner mixing-tube arranged for communication with a gas-supply connection and with said burner mixing-tube and having a valve-seat, a needle-valve superimposed in said burner mixing-tube adapted to said valve-seat and acting when open to divert the gas-jet against said shoulder, and means for adjusting the supply of air, substantially as described.

4. In an incandescent burner, a burner mixing-tube having its inner wall provided with an annular shoulder, and means for regulating the admission of gas to said tube and causing it to impinge on said shoulder, substantially as described.

5. In an incandescent burner, the combination of a burner mixing-tube having an internal annular shoulder, a support the base of which constitutes the lower part of said burner mixing-tube, a thimble threaded for attachment to said base and with a gas-supply connection and provided with a valve-seat that projects into the burner mixing-tube, a needle-valve superimposed in said burner mixing-tube adapted to said valve-seat and acting when open to divert the gas-jet against said shoulder, and means releasably mounted with reference to the support for controlling the admission of air to the burner mixing-tube, substantially as described.

699,252. COIL-CONTROLLED NEWSPAPER-VENDING MACHINE.
ALFRED W. SMITH, St. Louis, Mo., assignor to Henry C. Wootler and Frederick Wootler, St. Louis, Mo. Filed July 10, 1891. Serial No. 67,746. (No model.)

Claim.—1. In a coin-controlled vending-machine, a rotatable coin intercepting and advancing disk, a releasing-lever normally locking the same against rotation, a speed loosely mounted on the disk-shaft, a pawl pivoted to the disk and normally engaging the speed, a gravity-bar adapted to disengage the releasing-lever from the disk upon movement of the gravity-bar in one direction, a locking-pawl normally engaging the speed, said locking-pawl being adapted to be disengaged from the speed simultaneously with the disengagement of the releasing-lever from the disk, substantially as, and for the purpose set forth.

2. In a coin-controlled vending-machine, a rotatable coin intercepting and advancing disk, a releasing-lever normally locking the same against rotation, a speed loosely mounted on the disk-shaft, a pawl pivoted to the disk and normally engaging the speed, a gravity-bar having an offset for the free passage therethrough of the releasing-lever, a locking-pawl pivoted opposite the base of the gravity-bar, a lever pivoted between the locking-pawl and gravity-bar, legs on the gravity-bar and locking-pawl respectively which the opposite ends of the pivoted lever are respectively adapted to engage, the gravity-bar upon being raised serving to disengage the releasing-lever and locking-pawl from the disk and speed respectively, substantially as set forth.

699,253. MAIL-BOX. ALFRED W. SMITH, Admin. Mch. Filed Sept. 20, 1891. Serial No. 73,042. (No model.)

Claim.—1. In a mail-box, the combination of a door, a water-shed overhanging the door at the top, a vertical portion below the water-shed into alignment with which the face of the door is adapted to swing, said door having a horizontal channel crossing at the top thereof and a vertical channel at either side communicating therewith.

2. In a mail-box, the combination of a hinged door, a vertical strip on the box below which the door is adapted to close, the outer plate of the door having a flange at each edge adapted to embrace the side of the box and a channel in the edge of the door extending across the top and down the sides.

3. The combination with a mail-box, of a door hinged at its lower end and adapted to swing upwardly to a vertical position when closed, a water-shed overhanging the top of the door and a channel in the edge of the door extending across the top and down the sides, the side channels being open at the bottom.

699,254. SHAM FOR NEWSPAPER-VENDING MACHINE. JAMES W. SMITH, Worcester, R.I. Filed June 7, 1891. Serial No. 68,005. (No model.)

Claim.—In a sham for covered articles, the combination of a layer of stock having a line of curvilinear passages, the ends of which are disposed at the inner side of the layer, a layer of stock laid with its face against that of the first-named layer and having curvilinear passages intermediate the curvilinear passages in said first-named layer whereby a continuous passage is formed for a continuous thread, and the said continuous thread arranged to form a line of loop-stitches alternately through the curvilinear passages of the first-named layer and the second-named layer, and also passed the second time through passages of the layers to form lock or stay stitches; the said thread being drawn taut and suitably secured at its ends.

699,255. INHALER. HENRY GUYVER, Philadelphia, Pa. Filed June 11, 1891. Serial No. 64,190. (No model.)

Claim.—In an inductor, the combination of a shell, a mask formed with a screw-threaded inner end, a pipe screwed on the end of the mask, said pipe being reduced at its lower end, forming an internal conical valve-seat, a valve contained in the larger chamber of the pipe having a movement limited by the seat and the inner end of the threaded portion of the mask, a flexible connection between the mask and the valve, a tapered coupling-piece screwed in the outer end of the flexible connection, the tapered end of said coupling-piece being of a size to enter the outer reduced end of the pipe and to frictionally engage therewith, and a plurality of openings in the under side of the mask, substantially as shown and described.

699,256. FIRING ATTACHMENT FOR BREACH-LOADING ORDNANCE. JOHN W. STOKERT, Washington, D. C. Original application filed Oct. 23, 1906, Serial No. 23,701. Divided and this application filed June 2, 1908. Serial No. 66,994. (No model.)

Claim.—1. The combination with a carrier, of a breech-block mounted thereon, a spindle extending through the breech-block, and means connected to the carrier to permit the breech-block to turn but to prevent the spindle from turning, substantially as described.

2. The combination with a carrier, of a breech-block mounted thereon, a spindle within the breech-block, and a key mounted on the carrier, the breech-block and spindle being provided with grooves for the key whereby the breech-block can rotate and the spindle is prevented from rotating, substantially as described.

3. The combination with a spindle having a firing-opening for the reception of the primer, of means for holding the primer in position, and an ejector arranged to operate said means, before ejecting the primer, substantially as described.

4. The combination with a spindle having a firing-opening for the reception of the primer, of means for retaining the primer in position, an ejector for operating said means and ejecting the primer, and firing mechanism arranged to operate the ejector, substantially as described.

5. The combination with a spindle having a firing-opening for the reception of the primer, of means for retaining the primer in position, an ejector arranged to operate said means and eject the primer, a movable firing mechanism, and means connected to said movable firing mechanism for operating the ejector, substantially as described.

6. The combination with a spindle having a firing-opening for the reception of the primer, of a tumbler for retaining the primer in position and tumbler being provided with lugs, by means of which it is brought into inoperative and operative position by the insertion of the primer into the opening, substantially as described.

7. The combination with a spindle having a firing-opening for the reception of the primer, of an ejector, and a slide provided with an oblique slot and a loose pin mounted in the slot and adapted to engage the ejector, substantially as described.

8. The combination with a spindle having a firing-opening for the reception of the primer, of a slide having an oblique slot, and a loose pin mounted in said slot and adapted to engage and operate the ejector, substantially as described.

9. The combination with a spindle having a firing-opening for the reception of the primer, of an ejector having a projection, a slide having a recess embracing the projection and having an oblique slot, and a loose pin mounted in the slot and adapted to engage said projection to operate the ejector, substantially as described.

10. The combination with a spindle having a firing-opening for the reception of the primer, of a slide, an insulated plate mounted on the slide and adapted to engage the primer-wire, and a leaf also mounted on the slide adapted to embrace the primer-wire, substantially as described.

11. The combination with a spindle having a firing-opening for the reception of a primer, of a housing mounted on the spindle, a slide movably mounted in the housing, said slide being provided with an oblique slot, a loose pin mounted in the slot, an ejector operated by said pin, and a handle whereby the slide may be manually moved and the ejector operated to eject the primer, substantially as described.

12. The combination with a spindle having a firing-opening for the reception of the primer, of a housing mounted on the spindle, an ejector mounted in the housing and having a projection, a slide mounted in the housing having a recess embracing the projection and an oblique slot, and a loose pin mounted in the slot and adapted to engage the projection, substantially as described.

13. The combination with a spindle having a firing-opening for the reception of the primer, of a housing mounted on the spindle, an ejector mounted in the housing and having a projection, a slide mounted in the housing and having a recess embracing the projection and also having an oblique slot, and a loose pin mounted in said slot and adapted to engage said projection, substantially as described.

14. The combination with a spindle having a firing-opening for the reception of the primer, of a housing, a slide mounted in said housing, an insulated plate mounted on said slide, a hinged leaf also mounted on said slide, and means for moving the slide into and out of operative position, substantially as described.

15. The combination with a breech-block having a projection, of a spindle mounted within the breech-block, a housing mounted on the spindle, and a slide mounted in the housing having a groove and adapted to be operated by the projection on the breech-block engaging said groove, substantially as described.

16. The combination with a spindle having a firing-opening for the reception of the primer, of a housing mounted on the spindle, means for retaining the primer in position, an ejector mounted in the housing and provided with a lug for operating said retaining means, a slide mounted in the housing, and means for operating the ejector and thereby operating the retaining means and ejecting the primer, substantially as described.

17. The combination with a spindle having a firing-opening for the reception of the primer, of an ejector, a slide having an oblique slot, and a loose pin mounted in said slot, whereby the ejector is positively operated when the slide is moved in one direction and the ejector and pin resume their normal positions after the primer is ejected, substantially as described.

18. The combination with a housing having a recess and inclined slot, of an ejector having integral studs adapted to be slipped into the slot and retain the ejector in the recess, substantially as described.

19. The combination with a gun having a firing-opening for the reception of a primer, of an ejector, and a locking primer-retainer adapted to engage the outer rear end of the primer, substantially as described.

20. The combination with a gun having a firing-opening for the reception of a primer, of an automatic primer-ejector, and a locking primer-retainer adapted to engage the outer rear end of the primer and mounted independently of the ejector, substantially as described.

21. The combination with a gun having a firing-opening for the reception of a primer, of an automatic primer-ejector, a locking primer-retainer adapted to engage the outer rear end of the primer and mounted independently of the ejector, and means connected with the ejector for operating the retainer, substantially as described.

699,257. COMBINED HARROW AND ROLLER. JAMES SMITH, Madison, Ind. Filed Jan. 24, 1908. Serial No. 64,994. (No model.)

Claim.—1. The combination of a tongue, a seat-supporting bar connected thereto and extending rearward therefrom, standard-framed connected to said seat-supporting bar, rollers having their bearings in said standards and frames adapted for the attachment of suitable implements for operating in the soil, said frames being connected to and disposed on opposite sides of the tongue, substantially as described.

2. The combination of a tongue, rollers connected to the rear end thereof, a pair of frames pivotally connected to and laterally adjustable toward and from the tongue, whereby said frames may be set at any required distance apart, said frames being provided with suitable implements for operating in the soil, an elevating-rod connected to the tongue and elevating-rod attached to said frames and detachably connected to said elevating-rod, whereby said frames may be raised or lowered independently of each other or simultaneously, substantially as described.

3. The combination of a tongue, a seat-supporting frame extending from the rear and thence, laterally adjustable standard-framed connected to said seat-supporting frame, rollers mounted in said standard-framed and frames attached to and disposed on opposite sides of said tongue in advance of said rollers, said frames being adapted for the attachment thereto of suitable implements for operating in the soil, substantially as described.

4. The combination of a pair of frames of the character described, yokes connecting the same together, a tongue pivotally attached to the front yoke and adjustably secured to the rear yoke, whereby said tongue may be disposed at any desired inclination, a frame pivotally connected to and extending in rear of said tongue, and supporting rollers for said frame, substantially as described.

699,258. PACKING COMPOUND FOR IRON. JOHN M. STOKER, San Antonio, Tex. Filed Feb. 24, 1908. Serial No. 64,178. (No model.)

Claim.—A dry packing compound comprising dry alkali dust, E.P.S.M., wood-ashes, sulfur, borax, saltpeter, salicylic acid, substantially in the proportions named.

699,259. CHAIR-TRAY. HARRY A. TRIMBLE, Chicago, Ill., as assignor to Charles G. Page, Chicago, Ill. Filed July 17, 1901. Serial No. 63,677. (No model.)

Claim.—1. A chair-tray constructed with a body portion having an opening 3, an ash-pan removably supported within the opening with its top substantially flush with the top of the body portion, and a trough-shaped sign-rest projecting from one end of the ash-pan, said rest being supported upon and extending beyond the body portion so as to form a handle.

2. A chair-tray constructed with a body portion having an opening 3, a depression 4, and an ash-pan removably supported within the opening with its top substantially flush with the top side of the body portion, and having a trough-shaped projection which seats in the depression in the body portion and is adapted to form a combined handle and sign-rest.

3. A chair-tray comprising a body portion formed with a top 2, sides 3 and 4, an opening 5, and a depression 6 in said top; and an ash-pan B removably supported in said opening and having flanges 8 which rest upon the top, and a trough-shaped sign-rest C which fits in said depression and is adapted to serve as a handle for the ash-pan.

4. A chair-tray comprising a body portion formed with a top 2, sides 3 and 4, and attaching-flaps D, and provided with an opening 5 and a depression 6 in the top, an ash-pan B removably supported in said opening, and a trough-shaped sign-rest C projecting from the ash-pan and fitting in the depression in the top 2 and projecting beyond the edge of the same to form a handle for the ash-pan.

699,260. REFRIGERATOR-CAR. JAMES R. UNDERWOOD, Fayetteville, N. C. Filed May 14, 1901. Serial No. 60,948. (No model.)

Claim.—1. In a refrigerating-car having a chill-compartment surrounded by metal walls, a second set of metal walls surrounding the first set of walls, said second set of walls forming the outer walls of the car, a means for disseminating a cooling agent over the outer surface of the said second metal walls, and a supply-tank carried on the car and forming a cooperative part of said disseminating means, as specified.

2. A refrigerating-car, having a chill-compartment, whose side, end and top walls are of metal, means for disseminating a cooling agent over the outer surface of said walls, said means including a cooling-agent reservoir, a second chill-compartment disposed above the other compartment and in communication therewith, mechanism for ventilating and cooling the chilled compartments, and second chill-compartment having doorways for the purpose set forth.

3. The combination in a refrigerating-car provided with metallic top and sides, having means for disseminating a cooling agent over the outer surface; of a lower chill-compartment, and an upper chill-compartment, communicating with the other compartment, said upper compartment having an end opening and air-inlets, a closure member slidable over said opening, and adapted to clamp off the opening air-tight, and having air-openings, adapted when said closure member is adjusted in one direction to register with the air-openings in the end of the upper chill-compartment or ventilating the interior of the car, as specified.

4. The combination in a metallic-sided refrigerating-car, having a means for disseminating a cooling agent over the outer surface of the metallic body; of a lower chill-compartment surrounded by supplemental side and end walls, inside the regular sides and ends, whereby intervening spaces 5 5' are provided, outlets for discharging the condensations collected in said spaces 5 5', a second chilled compartment above the other, a horizontal metal surface separating the two compartments, the sides and ends of which extend over and discharge into the spaces 5 5', said chilled compartments having doorways for the purpose specified.

5. A metal-body refrigerating-car, having a valley extending lengthwise in the top thereof, an absorbent material covering the outer surface of the metal body and the valley-surface, and a reservoir held in the valley, said reservoir having outlets for feeding the contents into the valley beneath it, for the purpose specified.

6. In a refrigerating-car, provided with metallic top and sides, an absorbent covering for the sides and top thereof, said covering lying in contact with the said sides and top, and having the outer surface exposed to atmosphere, means carried in the car for feeding the absorbent covering, and a screen covering the outer face of the absorbent, as specified.

7. In a refrigerator-car, provided with metallic top and sides, an absorbent covering for the sides and top thereof, said covering lying in contact with the metal parts and having the outer face exposed to air, and spark-deflector devices held over the said outer face of the absorbent covering, for the purpose described.

8. A refrigerator-car, having a supplemental or second top, a felt covering resting on said second top, and an ice-chamber or cooling-space, disposed between the main freight or carrying compartment, and the felt-covered top.

9. The combination in a car of the character described, with the side and end walls; of the supplemental side and end walls *C* *C'*, respectively, held apart from the regular side and end walls, whereby intervening spaces *B* *B'* are provided, the end walls *C* having apertures and deflector-chests on the inner sides overhanging the said apertures, all being arranged substantially as shown and described.

699,261. TRANSFERRING BEVEL AND TRY SQUARE. GUYE VALLEE, Watertown, N. Y., assignor of one-half to John H. Spangue, Watertown, N. Y. Filed Feb. 11, 1902. Serial No. 92,581. (No model.)

Claim.—1. A transferring bevel and try square, comprising a frame having an arc with ends thereof, an indicating pointer or tongue pivotally mounted on said frame and having a shank portion designed to form various angles with the edge of the frame, a pivotal arm carried by the frame and designed to be rotated by said tongue as it is moved over said ends, as set forth.

2. A transferring bevel and try square, comprising in combination with a frame, an arc with a scale formed thereon, an angled tongue pivotally mounted on said frame and having a shank portion designed to be held at various angles to the side of the frame, a pivotal arm, mounted on the frame and having a cam projection which is designed to contact with the curved edge of the end of the tongue, as the latter is passed over said ends, whereby an angle between said arm and the adjacent edge of the frame is held off, equal to the angle between said shank portion of the tongue, and the opposite edge of the frame from that carrying the pivotal arm, as set forth.

3. A transferring bevel and try square, comprising a frame made up of two plates, spaced apart, an arc with a scale formed thereon intermediate the longitudinal edges of the lower plate of the frame, an angled tongue pivotally mounted on the frame, one end of said tongue formed into a pointer which is adapted to be passed over said ends, a shank portion of said tongue extending laterally from the frame, a pivotal arm carried by the frame and having a cam projection against which the inner curved or cam outline of said tongue is adapted to bear whereby said arm is moved in unison with the shank of said tongue, as set forth.

4. A transferring bevel and try square, comprising a frame made up of two skeleton plates spaced apart, an arc with a scale thereon, a trapezoid on the upper plate spaced apart from said arc, an angled tongue pivotally mounted between said plates of the frame, and having one end formed into a pointer which is adapted to be passed over said ends, an arm pivoted between the plates, and having a cam projection which is adapted to be in contact with the outer cam-face of said tongue, whereby the arm will be moved automatically as said tongue is moved over the ends, as set forth.

5. In combination with the frame, made up of two skeleton plates spaced apart, a pivotal arm mounted between the plates and adapted to rest in a space intermediate the plates and in a position with its outer longitudinal edge parallel with the adjacent edge of the frame, an angled tongue with integral shank portion, pivoted between the plates, and designed to be held by a cam projection of said arm, at right angles to the longitudinal edge of the frame, as set forth.

699,262. BUMPING-WAGON. MATTHEW VAN WAGEN, Lynn, Mass., N. Y. Filed Aug. 3, 1901. Serial No. 71,377. (No model.)

Claim.—1. In a dump-wagon the combination with hinged bottom sections of a dump-box, a rotary drum and cable connected to elevate said sections to their closed position, means for rotating the drum, a yielding stop for holding the drum in its adjusted position and a locking member pivotally mounted on the shaft and arranged to engage a fixed member on the wagon for holding said stop from yielding.

2. The combination with the hinged bottom sections of a dump-box adapted to drop by gravity, a rotary drum connected to close said sections, means for rotating the drum, a stop pawl or lever for holding the drum in its adjusted position, said stop-pawl being movable for simultaneously releasing the drum and disconnecting its rotating means therefrom, for the purpose described.

3. The combination with a dump-wagon having movable bottom sections, a drum, a cable connected to the drum and to said movable sections, a ratchet-wheel secured to the drum, an operating member or lever loosely mounted on the drum and provided with a pawl adapted to engage the teeth of the ratchet for rotating the drum in one direction, a stop-pawl for engaging the ratchet-teeth and operable manually to release the former pawl from engagement with the ratchet, and means for locking the stop-pawl in engagement with said teeth for preventing the revolving of the drum.

4. The combination with a dump-wagon having movable bottom sections hinged to its side walls, a rotary drum at one end of the movable sections, a racking member at the other end, cables or chains connected to said drum and to said racking member at opposite sides of its pivot, the intermediate portion of said cable being connected to the bottom sections and means for rotating the drum.

5. In a dump-wagon, the combination with a box having hinged bottom sections, a racking member pivoted to the rear wall of the box above the bottom sections, a drum secured to the box at the other end of the bottom sections, a cable or cables having their opposite ends connected to the racking member and to said drum and their intermediate portions connected to the movable sections, means for rotating the drum to wind the cable thereon, additional means for preventing the return movement of the drum and a locking member for holding the latter means in its operative position.

6. In a dump-wagon, a dump-box having its bottom wall formed of sections having upright side portions hinged to the side walls of the box, the upper edges of said upright portions of the sections being provided for preventing the accumulation of dirt or other substance thereon and discharging the dirt therefrom onto the horizontal portions of the sections.

7. A dump-wagon having hinged bottom walls, a rotary drum having cable connected thereto and to the bottom walls for the purpose described and a racking member mounted on the frame of the wagon and

connected to said cable at opposite sides of its axis for the purpose set forth.

8. In a dump-wagon the combination of a front axle and frame, the axle having an opening and the frame having a platform provided with an elongated opening, a king-bolt inserted through the elongated opening in the platform and having its lower end fitting closely in the opening in the axle and a fifth-wheel comprising upper and lower sections surrounding the king-bolt the lower section of the front and rear wheel carriages rolling downwardly at their opposite ends for the purpose set forth.

9. In a dump-wagon, the combination with a dump-box having movable bottom sections hinged to its side walls, a compensating member secured to the box at the rear end of the bottom walls, a drum revolutely mounted on the box at the front end of the bottom sections, a cable or chain connected to the compensating member and drum and also to the bottom sections, a ratchet-wheel secured to the drum, an operating member having a pawl movable into and out of engagement with the teeth of the ratchet for rotating the drum and releasing the same, a stop-lever pivotally supported at its intermediate portion and having its rear end adapted to engage the teeth of the ratchet beneath the pawl, a spring for yieldingly holding the stop-lever in engagement with the ratchet-teeth, a locking member for positively locking said lever in engagement with the ratchet-teeth, said locking member being movable for releasing the lever and the lever being arranged to move out of engagement with the teeth and to simultaneously force the pawl out of the path of said teeth, and means for holding the lever in its inoperative position.

699,268. BIRDHOUSE-FRAME. FREDERICK G. VALLER, Port Clinton, Ohio. Filed May 10, 1902. Renewed Sept. 12, 1901. Serial No. 75,322. (No model.)

Claim.—1. In a work-holding frame, the combination with a bent rod threaded at both ends and having an enlargement on one end; of a hollow cylinder including the latter end of said rod, and having an axial opening provided with screw-threads engaging the screw-threads upon the said end of said rod and having external screw-threads; a clamping-screw mounted upon the said rod for locking the same in said cylinder; a second bent rod screw-threaded at both ends, having an enlargement thereon also fitting within said cylinder; a perforated cap provided with internal screw-threads engaging external screw-threads upon said cylinder including said second rod and retaining the enlargement thereon within said cylinder; a coil-spring interposed between the ends of said rods within said cylinder; a lock-out on the said second rod for clamping the same with respect to said cylinder; a T-shaped tubular connection mounted upon the other end of said second rod and adjustable about the axis thereof and branching arms connected to and extending from said T-shaped connection, and a frame carried thereby; and a clamp mounted upon the other end of the said first-mentioned rod for attachment to a table or other fixed object, substantially as described.

2. In an adjustable work-holding frame, the combination with a pair of bent rods; of a cylinder having a screw-threaded opening at one end and engaged by the end of one of said rods and adjustable thereon and having external screw-threads; a clamping-pawl mounted upon said rod for clamping said cylinder against rotation with respect to said rod; a ball on the end of the other rod fitting within the opposite end of said cylinder; cone bearings for the said ball; a retaining-cap provided with a perforation and having internal screw-threads engaging external screw-threads upon the end of said cylinder, retaining the said ball within the cylinder, the said second rod having screw-threads thereon; and a clamping-out for retaining the same against rotation with respect to said cylinder, substantially as described.

3. In a work-holding frame, the combination with a bent rod having a base near its end and having a screw-threaded portion in the region of its supporting end; of a tubular T-shaped connection fitting over the end of said rod; a spring surrounding the said rod within said tubular connection; branching supports extending from the opposite arms of said T-shaped connection supporting a work-holding frame and a clamping-pawl engaging the end of said rod, the said T-shaped connection being adjustable about the axis of the said rod, substantially as described.

699,264. WINDOW-SHADE HANGER. JAMES C. WALLACE, Colorado City, Colo. Filed Oct. 22, 1900. Serial No. 24,672. (No model.)

Claim.—A window-shade hanger made from a single piece of wire, said wire being bent to form a horizontal shank having a screw-threaded end, a curved end intermediate of its length, an eye whose forward side extends upward from the shank and thence downward below and to one side of the same, a downwardly-inclined brace-arm continuous with said downward extension, and another arm bent at a sharp angle to said brace-arm and provided with an eye to rest in the curved end of the shank, substantially as described.

699,265. GARMENT-SUPPORTER. CHARLES WARREN, Chicago, Ill., assignor to David R. Turner, Chicago, Ill. Filed Dec. 21, 1902. Serial No. 41,508. (No model.)

Claim.—1. In a garment-supporter, the combination of a cord or strap; a member secured to said strap to form a shoulder on same; a sleeve slidably mounted on said strap and having on one side a jaw; a shank pivoted to said sleeve, having thereon a jaw adapted to coast with the jaw on the sleeve; said strap being extended above and below the sleeve and shank, and both jaws being located on the same side of the strap, and a wedge-shaped projection on said shank adapted to engage said member and force said jaws toward each other.

2. In a garment-supporter, the combination of a cord or strap; a member secured to said strap to form a shoulder on same; a sleeve slidably mounted on said strap and having on one side a jaw; a shank pivoted to said sleeve, having thereon a jaw adapted to coast with the jaw on the sleeve; said strap being extended above and below the sleeve and shank, and both jaws being located on the same side of the strap, said shank being adapted to engage the member on said strap and force said jaws toward each other.

3. In a garment-supporter, the combination of a cord or strap; a member secured to said strap to form a shoulder on same; a sleeve slidably mounted on said strap and having on one side a jaw; a shank pivoted to said sleeve, having thereon a jaw adapted to coast with the jaw on the sleeve; and a wedge-shaped projection on said shank adapted to engage said member and force said jaws toward each other, said wedge having a notch therein to engage said member and limit its movement relatively to said shank.

4. In a garment-supporter, the combination of a cord or strap; a member secured to said strap to form a shoulder on same; a sleeve slidably mounted on said strap and having on one side a jaw; a shank pivoted to said sleeve, having thereon a jaw adapted to coast with the jaw on the sleeve; said strap being extended above and below the sleeve and shank, and both jaws being located on the same side of the strap, a wedge-shaped projection on said shank adapted to engage said member and force said jaws toward each other; and means for limiting the movement of said sleeve along said strap.

5. In a garment-supporter, the combination of a strap having thereon a slit extending longitudinally of same and having a shoulder at one end of said slit, a pair of lever-jaws and shanks pivotally connected and slidably supported on said strap, a wedge-shaped projection on one of said shanks seated in said slit and adapted to bear upon said shoulder and thereby force said jaws toward each other.

699,266. MACHINE FOR HANDLING COWS. DR. SAMUEL F. WELSH, Aurora, Ill., assignor to the Western Wheelbarrow Company, Aurora, Ill., a Corporation of Illinois. Filed Feb. 2, 1901. Serial No. 68,711. (No model.)

Claim.—1. The combination with supporting device, of a feed-conveyor, the discharge and thereof being pivotally suspended from said supporting device at a point beyond the conveyor proper in a manner to permit the receiving end of said conveyor to be adjusted vertically and laterally without affecting the discharge, and a funnel suspended from the conveyor-frame and adapted to receive the discharge from said conveyor, substantially as described.

2. The combination with supporting device, of a feed-conveyor, the discharge and thereof being pivotally suspended upon independent vertical and horizontal axes from said supporting device at a point beyond the conveyor proper, in a manner to permit the receiving end of said con-

voyor to be adjusted vertically and laterally without affecting the discharge end thereof, and a funnel suspended from the conveyor-frame and adapted to receive the discharge from said conveyor, substantially as described.

2. The combination with a feed-conveyor pivotally supported at its discharge end so as to be capable of swinging vertically and laterally, of a funnel pivotally suspended under said conveyor and adapted to receive the discharge therefrom, substantially as described.

4. The combination with a shaft 34, of a shaft 43 arranged at right angles with said shaft, beveled gears connecting said shafts, a conveyor-frame pivotally suspended from said shaft 34 and carrying said shaft 43 about which it pivots, and means for driving said conveyor from the shaft 43, substantially as described.

5. A conveyor-belt having at each side a series of overlapping side plates, and U-shaped plates connecting opposite side plates together and means connecting said U-shaped plates to the belt, substantially as described.

6. A conveyor-belt having at each side a series of side plates, and U-shaped plates connecting opposite side plates together and means connecting said U-shaped plates to the belt, substantially as described.

7. A conveyor-belt having at each side a series of overlapping side plates, and a pair of oppositely-arranged U-shaped plates connecting each pair of opposite side plates together and means connecting said U-shaped plates to the belt, substantially as described.

8. A conveyor-belt having at each side a series of side plates, a pair of U-shaped plates connecting each pair of opposite side plates together, and an intermediate bar between each pair of U-shaped plates and connected to the belt, substantially as described.

699,967. AUTOMATIC FLUID-PRESSURE BRAKE APPARATUS. GEORGE W. HENNINGSEN, Pittsburg, Pa., assignor to the Westinghouse Air Brake Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed Feb. 25, 1897. Serial No. 583,094. (No model.)

Claim.—1. In an automatic fluid-pressure brake apparatus, the combination, with a series of brake-cylinders, of means for regulating or limiting the flow of fluid from an emergency-valve device to the brake-cylinders in emergency applications, whereby the application of the higher degree of pressure to the brake-cylinder pistons may be effected substantially simultaneously on all of the cars of a train, substantially as set forth.

2. In an automatic fluid-pressure brake apparatus, the combination, with a brake-cylinder, of means for automatically limiting discharge of fluid from the train-pipe by retarding its flow into the brake-cylinder.

3. In an automatic fluid-pressure brake apparatus, the combination, with a brake-cylinder, and means for permitting a greater flow of fluid thereto in emergency applications than in service applications, of means for restricting the flow from the train-pipe and auxiliary reservoir in emergency applications after the application has commenced, or before the piston has completed its stroke, substantially as set forth.

4. In an automatic fluid-pressure brake apparatus, the combination, with a brake-cylinder, of means for permitting a limited flow of fluid under pressure from the auxiliary reservoir to the brake-cylinder in service applications and a greater flow from the auxiliary reservoir and train-pipe in emergency applications, of means whereby the greater flow of fluid from the reservoir and train-pipe in emergency applications may be reduced before the piston in the brake-cylinder has completed its stroke, substantially as set forth.

5. In an automatic fluid-pressure brake apparatus, the combination, with a brake-cylinder, of means for permitting a comparatively limited flow of fluid to the brake-cylinder in service applications, and a greater flow in emergency applications, and means operated by the flow of fluid from the auxiliary reservoir and train-pipe to the brake-cylinder for reducing the flow thereto, substantially as set forth.

6. In an automatic fluid-pressure brake apparatus, the combination, with a brake-cylinder, and a triple-valve device, of a passage from the triple-valve device to the brake-cylinder through which fluid may pass when released from the auxiliary reservoir and train-pipe, and means whereby the capacity of the passage may be restricted in emergency applications, substantially as set forth.

699,968. GLASS-TANK. CARL R. WILSON, Chicago, Ill. Filed July 21, 1899. Serial No. 54,570. (No model.)

Claim.—1. In a glass-tank, the combination with the closed water-jacket, of the closed tank supported therein so that it is surrounded throughout by the contents of the jacket, and a funnel passing through the water-jacket into said tank, substantially as and for the purpose described.

2. In a glass-tank, the combination with the closed water-jacket, of the closed tank supported therein so that it is surrounded throughout by the contents of the jacket, a rotating stirrer in said tank having a handle projecting outside of the water-jacket, and a funnel passing through the water-jacket into said tank, substantially as and for the purpose described.

3. In a glass-tank, the combination with the water-jacket, of the tank supported therein and surrounded on all sides thereby, removable covers for said tank and jacket, and a funnel passing through the water-jacket into said tank, substantially as and for the purpose described.

4. In a glass-tank, the combination with the water-jacket, of the tank supported therein so as to be entirely surrounded by the fluid in said jacket, a rotating stirrer mounted in the said tank, removable covers for said tank and jacket through which said stirrer passes, and a funnel passing through the water-jacket into said tank, substantially as and for the purpose described.

5. In a glass-tank, the combination with the water-jacket, of the tank supported therein so as to be entirely surrounded by the fluid in said jacket, removable covers for said jacket and tank having a centrally-located aperture therein, the stirrer rotatably mounted in said tank and consisting of a shaft having its upper end projecting through said aperture and blades carried thereby within the tank throughout its length, and a removable handle, substantially as and for the purpose described.

699,969. IRONY AND CATON-BASE. HOLLAND WHEELER, LAWRENCE, Kans. Filed Mar. 20, 1901. Serial No. 55,090. (No model.)

Claim.—1. The combination with a curb having an opening in its front and an opening in its bottom, of an open-ended grate having its base projecting into the front opening, partitions supporting said base and arranged to form between them channels having sloping bottoms, substantially as and for the purpose described.

2. In a catch-basin inlet, an open-ended grate having a supporting-frame, a base-box arranged to support the frame having in its upper edge notches of different depths, and adjusting-blocks adapted for insertion in the said notches, substantially as and for the purpose described.

699,970. RAIL FOR HITCHING JOINTS ON RAILWAYS. OTTO WELLMER, Dusseldorf, Germany. Filed Dec. 31, 1901. Serial No. 57,572. (No model.)

Claim.—1. A rail-joint for double rail-way-tracks, thereby characterized that a space is cut out under that end of each rail which is first traversed by the wheels of the carriages, the cutting out of the said space producing a somewhat elastic springy tongue which by yielding slightly when the wheels pass over the junction of two rails, maintains the job.

2. A railroad-rail provided with a web notched at the end, and with

a resilient head that forms a projecting tongue above the notch, substantially as specified.

699,971. ACETYLENE-GAS GENERATOR. ALEXANDER D. WILLIAMS, Columbus, Ireland. Original application filed May 28, 1899. Serial No. 717,899. Divided and this application filed Nov. 6, 1902. Serial No. 58,074. (No model.)

Claim.—1. In an acetylene-gas generator provided with a water-tank the combination of a gas-holder disposed in said tank and being provided at its top with a charging-opening the walls of which are lined by open-ended concentric cylinders closed at their bottom and forming a water seal, of a charging device comprising concentric cylinders closed at their top the inner of said concentric cylinders being divided by partitions into a water-chamber and an air-chamber and being adapted to be inserted in the charging-opening of the holder and the outer one of said cylinders being adapted to be inserted in the water seal, a connecting-pipe at the top of the charging-cylinders and affording communication to the space within the walls thereof, a valved extension to said pipe adapted to enter the water-chamber of the inner charging-cylinder and a perforated curd-holding vessel attached to the bottom portion of said cylinder, substantially as described.

699,972. REVOLUTION-INDICATOR. BRUCE T. WILLIAMS, Somerville, Mass., assignor to Hancock Inspector Company, Boston, Mass., a Corporation of Massachusetts. Filed Dec. 20, 1901. Serial No. 57,512. (No model.)

Claim.—1. In a revolution-counter, the combination of a dial, a plurality of independently-driven pointers, one at least of the pointers being driven by a train of mechanism which includes a gear-wheel, a pointer-shaft, friction-clutch clamped upon the said shaft on a friction-clamp and provided with radially-extending resilient arms, and a pin secured to the gear-wheel engaged by said arms.

2. In a revolution-counter, the combination of a dial, a plurality of independently-driven pointers, one at least of the pointers being driven

by a train of mechanism which includes a gear-wheel, a pointer-shaft, friction-claws clamped upon the said shaft and provided with radially-extending resilient arms, and a pin secured to the gear-wheel engaged by said arms.

3. In a revolution-counter, the combination of a dial, a pair of pointers, one secured to an inner shaft, the other to a servo-shaft journaled on the inner shaft, a sleeve, fixed to the inner shaft and having circumferential dimensions equal to those of the servo-shaft, interchangeable worm-wheels, and interchangeable friction-driven mounted respectively on the servo-shaft and fixed sleeve, and driving-gears for the said worm-wheel, substantially as described.

699,978. DIRT-BORING APPARATUS. WILIAM WOLKE, Budapest, Austria-Hungary. Filed Sept. 10, 1904. Serial No. 20,496. (No model.)

Claim.—1. In a water-actuated boring apparatus, a cylinder, a reciprocable tool, a by-pass, means for sending water to said cylinder and by-pass, a valve controlling the by-pass automatically closed by the force of the moving water, whereby the inertia of the column of water is imparted to the tool, substantially as described.

2. In a boring apparatus, a cylinder, a reciprocable tool, a by-pass, hollow bore-rods to send water to said cylinder and by-pass, a valve controlling the by-pass automatically closed by the force of the moving water to cause the inertia of the moving column of water to drive the tool and a suitably-located air-chamber to prevent the force of impact of the water from being transmitted to the bore-rods, substantially as described.

3. In a water-actuated boring apparatus, a cylinder, a reciprocable tool, a by-pass, hollow bore-rods to send water to said cylinder and by-pass, a valve controlling the by-pass, automatically closed by the moving water to cause said water to act by inertia on the tool, means for determining the length of time that the water effectively acts on the tool and means for determining the number of blows per unit of time, substantially as described.

4. In a water-actuated boring apparatus, a cylinder, a spring-actuated reciprocable tool, a by-pass, hollow bore-rods to send water to said cylinder and by-pass, a valve controlling the by-pass automatically closed by the force of the moving water to cause the inertia of the moving column of water to drive the tool and an air-chamber located above the cylinder on the end of the bore-rod to prevent the force of impact of the water from being transmitted to the bore-rods, substantially as described.

5. In a water-actuated boring apparatus, a cylinder, a reciprocable tool, a by-pass, a hollow bore-rod to send water to said cylinder and by-pass, a valve controlling the by-pass automatically closed by the force of the moving water to cause the inertia of the moving column of water to drive the tool, an air-chamber and a weighted element forming part of the bore-rod, substantially as described.

6. In a water-actuated boring apparatus, a cylinder, a reciprocable tool, a by-pass, a valve controlling the by-pass, a hollow bore-rod, and an air-chamber and a heavy hollow element between the end of the bore-rod and cylinder to prevent shock being transmitted to the bore-rod and to determine the number of impacts per unit of time, substantially as described.

7. In a water-actuated boring apparatus, a reciprocable spring-actuated tool, a casing, a cylinder having an upper conical end covered to the casing and provided with by-pass ports, a yieldingly-held valve controlling the by-pass ports and having a central passage over the cylinder

leading to the tool, and means for preventing the translation of shock to the end, substantially as described.

8. In a water-actuated boring apparatus, a hollow bore-rod, an air-chamber, the end of the bore-rod projecting into one end of said chamber to form an air-trap, a casing, an element connecting one end of the casing and air-chamber that determines the direction of the shock imparted by the water, a cylinder in said casing having a flaring end, by-pass ports in said flaring end, a spring-actuated piston in said cylinder, a tool carried by the piston and a ring-valve controlling the by-pass ports automatically closed by the moving water to direct the inertia of the moving column through the valve against the piston, substantially as described.

9. In a water-actuated boring apparatus, a hollow bore-rod, an air-chamber, the end of the bore-rod projecting into the upper end of said chamber to form an air-trap, an open-ended cylinder, an enlarged conical end to said cylinder, by-pass ports in said conical portion, a casing surrounding the cylinder, a plug in the end of the casing provided with openings to admit water to the side of the bore-rod, a piston in said cylinder, a tool secured to said piston, a collar, a spring between the collar and plug and a spring-actuated ring-valve controlling the by-pass ports automatically operated by the water to direct the inertia of the moving column against the piston to drive the tool, substantially as described.

699,974. ACETYLENE-GAS GENERATOR. JAMES A. WOOD, JR., Brooklyn, N. Y. Filed July 8, 1901. Serial No. 67,312. (No model.)

Claim.—1. In an acetylene-gas-generating apparatus, the combination with a water-tank A, having a gas expansion and condensation chamber B at the bottom, of a generating-chamber having a carbide-holder, a water-pipe, having a valve, connecting the base of the generator with the base of the water-tank, a gas-pipe connecting with the top of the generator and passing down through the water-tank to chamber B, a gas-outlet pipe leading from said chamber through the water-tank and connecting with a pipe having a controlling-valve, a regulator having a rising and falling gasometer, device connecting said controlling-valve with the regulator and a gas-inlet pipe to the regulator, substantially as and for the purpose described.

2. In an acetylene-gas-generating apparatus, the combination with the water-supply tank, of a generating-chamber having a carbide-holder, a valved water-pipe connecting said tank with the base of the generator, a gas-outlet pipe leading from the top of the generator, a gas and air mixture O having a controlling-valve, an expansion and condensation chamber between the generator and said gas and air mixture, a gas-supply pipe connecting said chamber with the mixer, a gas-regulator, a pipe leading from the mixer to said regulator and device connecting the regulator with said controlling-valve, substantially as and for the purpose set forth.

3. In an acetylene-gas-generating apparatus, the water-supply tank

and the gas-generator having a carbide-holder, and a valved water-pipe connecting said tank and the generator at the base, in combination with chamber B, an expansion and condensation chamber L, a gas-pipe connecting the generator with said chamber L, a gas and air mixer O having a controlling needle-valve G, a pipe 15 connecting chamber L with said mixer, a regulator having a rising and falling gasometer above said chamber L, opening device connecting the gasometer with said needle-valve, discharge-pipe 12 from the mixer, the house service-pipe H and the return gas-pipe 16 connecting with pipe 12, said pipe 16 passing up into the gasometer of the regulator whereby steam or water-vapor will be condensed before the gas enters the mixer and gas from the house service-pipe will quickly exit on the regulator to control the flow of gas, substantially as and for the purpose as set forth.

699,975. AUTOMATIC ANNUNCIATOR. JAMES A. WOOD, JR., Albany, N. Y., assignor to Western Electric & Manufacturing Company, a Corporation of Georgia. Filed June 10, 1901. Serial No. 68,919. (No model.)

Claim.—1. A solenoid for imparting a momentary movement to reset annunciators or other similar mechanism, comprising a hollow coil and two cores extending into the opposite ends thereof, one of the said cores being longer and heavier than the other, and so arranged that when an electrical impulse is passed through the coil the larger core will be given an impulse, the momentum obtained thereby causing the said larger core to momentarily go beyond the point to which the current alone would move it so as to actuate the shorter core, the said larger core then being returned to the point out of engagement with the short core where it is held by the current until it is interrupted, substantially as described.

2. A solenoid for imparting movement to a suitable mechanism, comprising a pair of hollow coils, comparatively long connected cores extending into said coils, the connection which joins said short coils being connected with the mechanism to be operated, and means for causing an electrical impulse through the coils, the structure being such that the long cores will be drawn inwardly in the coils so as to gain sufficient momentum to carry them still further so as to strike the short cores for actuating the mechanism connected therewith, after which the long cores will be separated from the other cores by gravity, and will fall back to the point where the current holds them, the said long cores then dropping to their lowest position when the current is interrupted, substantially as described.

3. A mechanism for actuating a resetting device for annunciators, comprising a solenoid made up of a hollow coil, a divided core adapted to reciprocate therein one portion of the said core being connected with a reciprocating rod, a resetting-spring adapted to control the position of the annunciator and connected with the said rod and means for passing an electrical impulse through the coil of the solenoid whereby one portion of the divided core will be given a momentum which will carry it against the other portion of the core after which it will return to the point where

the current holds it until the current is interrupted the reset mechanism being given a momentary actuation, substantially as described.

4. In a resetting mechanism for annunciators the combination with a reciprocating pointer-controlling slide of a rod for lifting the same, a solenoid made up of a pair of hollow coils, a pair of short cores connected with each other and with the lifting-rod, a pair of long cores connected with each other and extending well into the coils, and means for causing the coils whereby the long cores will be drawn inwardly, gaining sufficient momentum to overcome gravity momentarily and strike the short cores and lift the annunciator-slide, after which they will fall back out of engagement with the short cores in the point where the current holds them until said current is broken, substantially as described.

5. In a resetting mechanism for annunciators the combination with a reciprocating slide adapted to positively release the pointers of the said annunciator, of a lifting-rod for opening the said slide, a solenoid provided with hollow coils arranged on either side of the said rod, divided cores extending into the opposite ends of the said coils, one pair of cores being shorter than the other, a plate connecting the short cores and engaging the lifting-rod, a plate connecting the long cores and moving freely with respect to the said lifting-rod, and means for passing an electrical current through the coils whereby the long cores will be drawn inwardly so as to engage and lift the short cores and momentarily raise the lifting-rod, after which when the current is interrupted by releasing the push-button the said long cores will drop out of contact with the short cores because of the action of the force of gravity, substantially as described.

6. In combination with an annunciator, of a reset mechanism therefor comprising a solenoid having hollow coils, divided cores moving therein, one portion of each core being longer and heavier than the other portion thereof, a reset-slide adapted to return the pointers of the annunciator to their normal positions, connected with the short portions of the said divided cores, suitable wiring for leading part of the coil-bell current of the annunciator through the solenoid-coils, whereby upon the circuit being completed for a new call the energizing of the solenoid-coils will impart momentum to the long cores and force them momentarily against the short cores for actuating the reset-slide, the structure being such that if other calls come in while the coils are energized, they will be indicated, substantially as described.

699,976. FOOTMARKING AND STAMP-CAPING MACHINE. JAMES E. WHEAT, Omaha, Neb. Filed Mar. 21, 1901. Serial No. 62,181. (No model.)

Claim.—1. In a postal machine, the combination with printing mechanism and feed mechanism having a feed-disk and feed-feed device, of a separating device for individually feeding the letters through said disk, a drive-shaft, an eccentric upon said shaft, a reciprocating guide-bar, and a link connecting the eccentric and guide-bar and carrying said separating device, substantially as described.

2. In a postal machine, the combination with a frame, of a feed-chute and a face-plate cooperating therewith and forming a slot for the feed of letters to the machine, printing mechanism for canceling and post-marking the letters passing through said slot, a follower for forcing the letters against said face-plate, spring-actuated detents normally closing the slot, separating devices for individually feeding the letters through said slot to the printing mechanism against the tension of said spring-actuated detents, a drive-shaft, an eccentric upon said shaft, a reciprocating guide, and a link connecting the eccentric and guide and carrying said separating devices, substantially as described.

3. In a postal machine, the combination with a frame, of a feed-chute and a face-plate cooperating therewith and forming a slot for the feed of letters to the machine, detents pivoted to said plate and normally lying flush with the outer surface of the plate and closing or guarding said slot, springs acting on the detents, separating devices for individually feeding the letters through said slot against the tension of the spring-actuated detents, and means for moving the separating device in an irregular path to cause the same to move downwardly toward the face-plate to contact with the letters and feed them through said slot and then to move upwardly and away from said face-plate to release the letters, substantially as described.

4. In a postal machine, the combination with a frame, of a supporting-tray for the mail-matter, the same comprising a series of spaced parallel rods fixed at their inner ends to the frame, spaced substantially U-shaped side brackets also fixed at their inner ends to said frame, and a stay-plate connecting said brackets at their outer ends and serving as a support for the outer ends of the rods, substantially as described.

5. In a postal machine, the combination with a frame, of a feed-chute and a face-plate cooperating therewith and forming a slot for the feed of letters to the machine, printing mechanism for canceling and post-marking the letters passing through said slot, a follower for forcing the letters against said face-plate, spring-actuated detents normally closing the slot, separating devices for individually feeding the letters through said slot to the printing mechanism against the tension of said spring-actuated detents, a drive-shaft, an eccentric upon said shaft, a reciprocating guide, a link connecting the eccentric and guide and carrying said separating devices, a delivery-tray, a follower movable along said tray and cooperating with a stop or shoulder upon the frame to support the letters discharged from the printing mechanism, a thrust device for forcing said follower out along the delivery-tray and clamping the mail-matter, a cam upon the drive-shaft, and a bell-crank lever between the cam and thrust device for operating the latter, substantially as described.

6. In a postal machine, the combination of a frame, a transverse block secured to the sides of the upper portion of the frame, a feed-tray, a face-plate located upon the front side of said transverse block and cooperating with the tray to form a feed-slot, spring-actuated detents carried by said plate and guarding said slot, a back-plate arranged in rear of said transverse block and forming therewith a guideway, a drive-shaft, an eccentric thereon, a reciprocating bar moving in said guideway, a link connecting said bar to the eccentric, and force-feed devices carried by said link to feed the letters through said slot, substantially as described.

7. In a postal machine, the combination of a frame, a base therefor, a primary drive-shaft journaled in the base, means for communicating motion to said shaft, feed and delivery chutes at the top and bottom of the frame, a face-plate cooperating with the feed-chute to form therewith a feed-slot, a screw-shaft mounted upon the feed-chute, a follower also mounted upon said shaft and operated by said shaft, an auxiliary drive-shaft journaled in the frame, connections between the same and the primary drive-shaft, a reciprocating guide-bar, an eccentric on the auxiliary shaft, a link connecting the guide-bar and eccentric, force-feed devices carried by the link for feeding the mail-matter through said slot, a counter-shaft journaled in the frame and driven from the auxiliary drive-shaft, printing, clamping and feeding rollers upon said auxiliary drive and counter shafts, a cam upon the auxiliary drive-shaft, gearing upon the counter-shaft for operating the screw-shaft, a follower upon the delivery-chute, a thrust device for moving the follower, and a bell-crank lever between the cam and thrust device, substantially as described.

699,977. HARVESTING-MACHINE. AUGUST T. BENTLEY, JR., Chicago, Ill., assignor of one-third to Milton L. Thackeray, Chicago, Ill. Filed Jan. 23, 1901. Serial No. 48,004. (No model.)

Claim.—1. In a harvesting-machine, the combination with a traction-wheel, of a shaft about which said traction-wheel is rotatably mounted, a framework also mounted upon said shaft, a second wheel rotatably mounted about said framework, two rows of knife-blades moving relatively in opposite directions, a wave-shaped cam mounted upon the interior periphery of said traction-wheel, means interposed between the said wave-shaped cam and the said two rows of knife-blades for causing an action thereon in opposite directions, said means passing transversely through

said framework, and lever mechanism for disengaging said means from the said wave-shaped cam, substantially as described.

2. In a harvesting-machine, the combination with a traction-wheel of a shaft about which said traction-wheel is rotatably mounted, a framework also mounted upon said shaft, a second wheel rotatably mounted about said framework, two rows of knife-blades moving relatively in opposite directions, a wave-shaped cam mounted upon the interior periphery of said traction-wheel, means interposed between the said wave-shaped cam and the said two rows of knife-blades for causing an action thereon in opposite directions, said means passing transversely through said framework, lever mechanism for disengaging said means from the said wave-shaped cam, a framework for supporting the said two rows of knife-blades, and means mounted upon said knife-supporting framework for adjusting the height thereof from the ground, substantially as described.

3. In a harvesting-machine, the combination with a traction-wheel, of a shaft about which said traction-wheel is rotatably mounted, a framework also mounted upon said shaft, a second wheel rotatably mounted about said framework, two rows of knife-blades moving relatively in opposite directions, a wave-shaped cam mounted upon the interior periphery of said traction-wheel, means interposed between the said wave-shaped cam and the said two rows of knife-blades for causing an action thereon in opposite directions, said means comprising levers and connecting-rods passing through said framework, lever mechanism for disengaging said means from the said wave-shaped cam, a framework for supporting said two rows of knife-blades, and means mounted upon said knife-supporting framework for adjusting the height thereof from the ground, substantially as described.

699,978. CONVEYER. ROLLAND A. SPOTER, Portsmouth, N. H. Filed Aug. 22, 1901. Serial No. 72,900. (No model.)

Claim.—1. A conveyor comprising, baskets provided with a central platform in each basket, sides extending above and below the said platform, an end projecting from the platform of each basket and joining the sides thereof, rollers journaled to the baskets, linked drive-chains pinned to the baskets, sprocket drive-wheels geared with the linked drive-chains, and guide-wheels for the latter.

2. A conveyor comprising, baskets provided with a platform in each basket, sides extending above and below the platform, an end extending from one side of the platform and joining the sides at one end of each basket, rollers journaled to the baskets, linked drive-chains, two of the connecting-pieces of the chain journaled to each side of each basket, sprocket drive-wheels geared with the linked drive-chains, and guide-wheels for the baskets.

3. A conveyor comprising, baskets provided with a central platform in each basket, sides extending above and below the platform, journal-pins extending from the central portion of the baskets, drive-chains and rollers journaled with the said pins, a belt extending from one end of each side of the baskets and journaled to the drive-chains, sprocket drive-wheels geared with drive-chains, and guide-wheels for the said chains.

4. A conveyor comprising, baskets provided with a platform in the central portion of each basket, sides extending above and below the said platform, an end joining the sides on one side of the platform, linked drive-chains, rollers supporting the linked drive-chains, a pin connecting the rollers, chains and baskets in the middle portion of the baskets, a belt connecting the linked chains with the end of a basket, sprocket drive-wheels, and guide-wheels operating with the linked chains, a curved cover extending over the drive-wheels, a sufficient distance therefrom for the clearance of the baskets, guide-wheels for the baskets, and tracks for the rollers.

5. A conveyor comprising, baskets provided with a central platform in each basket, sides extending above and below the platform, journal-pins extending from the central portion of each basket, drive-chains and rollers journaled with the said pins, a belt extending from one end of each side of the baskets and journaled to the drive-chains, sprocket drive-wheels geared with the drive-chains, a curved cover extending over the drive-wheels, and a sufficient distance therefrom for the clearance of the baskets, guide-wheels for the baskets, and tracks for the rollers.

699,979. TEMPORARY BLINDER. ALBERT S. BALLANTYNE, Chicago, Ill. Filed May 26, 1901. Serial No. 61,821. (No model.)

Claim.—1. In a temporary blinder, the combination of a plurality of leaf-holders adapted to hold a plurality of independent stacks or groups of removable leaves, swinging covers, means for pivotally connecting the said leaf-holders together, and a non-flexible back connected and arranged to automatically adjust itself to movements of the leaf-holders.

2. In a temporary blinder, the combination of a plurality of leaf-holders capable of holding a plurality of independent stacks or groups of removable leaves, means for adjusting the size or leaf-holding capacity of each leaf-holder, swinging covers, suitable means for connecting the leaf-holders together, and a non-flexible back connected and arranged to automatically adjust itself with respect to adjustments or variations in the size of the said leaf-holders.

3. In a temporary blinder, the combination of a plurality of pivotally-connected leaf-holders capable of holding a plurality of independent stacks or groups of removable leaves, swinging covers, toggle devices for changing or varying the size or leaf-holding capacity of the said leaf-holders, and a non-flexible back having a shifting connection with said leaf-holders and adapted to automatically adjust itself with respect to movements on the part of said leaf-holders.

4. In a temporary blinder, the combination of a plurality of leaf-holders hinged together and capable of holding a plurality of independent stacks or groups of removable leaves, swinging covers, suitable devices for changing or varying the size or leaf-holding capacity of said leaf-holders, and a non-flexible back composed of a plurality of relatively shifting sections and adapted to automatically adjust itself with respect to changes in the size or leaf-holding capacity of said leaf-holders.

5. In a temporary blinder, the combination of a plurality of hinged-connected leaf-holders, adjusting devices for varying the size or leaf-holding capacity of said leaf-holders, covers swingingly secured to the outer corners of said leaf-holders, and a central back connected and arranged to automatically adjust itself when the said leaf-holders are adjusted.

6. In a temporary blinder, the combination of a plurality of hinged-connected leaf-holders, threaded rods and toggle-levers for changing or varying the leaf-holding capacity of said leaf-holders, covers swingingly connected with said leaf-holders, and a back constructed and arranged to automatically expand or contract with the said adjustable leaf-holders.

7. In a temporary blinder, the combination of a plurality of hinged-connected leaf-holders, threaded rods and toggle-levers for varying the size or leaf-holding capacity of said leaf-holders, a member adapted to serve as the main section of the blinder-back, filling members adapted to serve as supplemental or side sections of said back, and suitable connections between said leaf-holders and said main back-section, and also between said leaf-holders and the filling members, whereby the temporary blinder can be readily opened, and also whereby the back of the blinder will automatically adjust itself with respect to the expansion or contraction of the leaf-holders.

8. In a temporary blinder, the combination of a pair of expansible leaf-holders hinged-connected at their inner corners, a back having a shifting connection with the axis about which the leaf-holders swing relatively to each other, adjusting devices for varying the size or leaf-holding capacity of said leaf-holders, connecting devices whereby the said back automatically adjusts itself with respect to the expansion or contraction of the leaf-holders, and covers swingingly secured to the outer corners of said leaf-holders.

9. In a temporary blinder, the combination of a plurality of leaf-holders or clamping members, a hinge or pivotal connection between the inner corners of said leaf-holders or clamping members, toggle-lever devices for varying the size or leaf-holding capacity of said leaf-holders or clamping members, a back having shifting connection with said leaf-holders or clamping members, and covers swingingly connected with the outer corners of said leaf-holders or clamping members.

10. In a temporary blinder, the combination of a pair of expansible leaf-holders hinged-connected at their inner corners, a back having a shifting or sliding connection with the axis about which the leaf-holders swing relatively to each other, adjusting devices for varying the size or leaf-holding capacity of said leaf-holders, connecting devices whereby the said back automatically adjusts itself with respect to the expansion or contraction of the leaf-holders, and covers swingingly secured to the outer corners of said leaf-holders.

11. In a temporary blinder, the combination of a plurality of leaf-holders or clamping members, a hinge or pivotal connection between the inner corners of said leaf-holders or clamping members, a back having a shifting connection with the axis about which the said leaf-holders or clamping members swing relatively to each other, and covers swingingly connected with the said leaf-holders.

12. A temporary blinder comprising a plurality of hinged-connected leaf-holders, said leaf-holders being in a superimposed or one-on-top-of-the-other condition when the blinder is closed or lying on its side, a blinder-back having shifting connection with said leaf-holders, and covers swingingly connected to the outer corners of said leaf-holders.

13. In a temporary blinder, the combination of a plurality of expansible leaf-holders, hinge connection between said leaf-holders, the said leaf-holders being in a superimposed or one-on-top-of-the-other condition when the blinder is closed and lying on its side, adjusting devices for changing the size or leaf-holding capacity of said leaf-holders, and covers swingingly secured to said leaf-holders.

14. In a temporary blinder, the combination of a plurality of adjustable leaf-holders pivotally or hinge connected together and arranged to lie one on top of the other when the blinder is closed and lying on its side, adjusting devices for varying the size or leaf-holding capacity of said leaf-holders, a plurality of members combining to form a back to said blinder, swinging or shifting connections between said back members and said leaf-holders, and covers swingingly connected with the said leaf-holders.

13. In a temporary binder the combination of a plurality of hinge-connected leaf-holders, a rigid member serving as a main section for said leaf, and a spring serving as a medium of connection between the main leaf-section and the pivotal or hinge-like connection between the leaf-holders, whereby the said leaf-holders may be caused to swing relatively to each other when the binder is opened.

16. In a temporary binder, the combination of a plurality of hinge-connected leaf-holders, each leaf-holder being provided with a plurality of telescoping devices adapted to extend through holes or openings in the leaves, a back having a shifting connection with said leaf-holders, adjusting devices for varying the size or leaf-holding capacity of said leaf-holders, and covers swingingly connected with the outer corners of said leaf-holders.

17. In a temporary binder, the combination of a plurality of adjustable leaf-holders, said leaf-holders being arranged parallel and adapted to lie one on top of the other when the binder is closed and lying on its side, each leaf-holder being provided with telescoping and walls, adjusting devices accessible through openings in said walls and adapted to vary the size or leaf-holding capacity of said leaf-holders, a suitable back having swinging or shifting connection with said leaf-holders, and covers swingingly connected with the outer corners of said leaf-holders.

18. In a temporary binder, the combination with clamping members for the leaves or sheets of the book, said clamping members being hinge-connected and adapted to lie one on top of the other when the binder is closed and lying on its side, of a rigid back flexibly secured to said members, so as to permit freely opening the binder or book.

19. In a temporary binder, the combination with a plurality of clamping members hinged together, said clamping members being side by side when the binder is thereon open, of a sectional back secured to said members, to permit the free opening of the book and the operation of the clamping members.

20. In a temporary binder, the combination with two clamping members having side plates, between which the leaves are adapted to be clamped, of telescoping pins between said plates on which the leaves are adapted to be strong, adjusting devices between said plates for expanding the plates or drawing them together and clamping them upon the contained sheets, and pivotal or hinge-like connections for securing said members together in the binder.

21. In a temporary binder, the combination with two clamping members, each clamping member being adapted to clamp a number of the sheets or leaves together, of covers hinged to said members, a back for said members also secured to said members and comprising a central curved portion, and curved filling members at the ends of said central portion.

22. In a temporary binder, the combination with two clamping members, variable in width, of a central back portion as wide as the members when contracted to the greatest extent, filling members extendible in cross-section, between the said clamping members and the back portion to allow for the expansion of said members, the arrangement being such that the back is closed at all times.

23. A temporary binder constructed with rigid covers and also with a rigid back, adjustable leaf-holders hinged or pivotally connected together and arranged to lie one above the other when the binder is closed and lying on its side, suitable adjusting devices for varying the size or leaf-holding capacity of said leaf-holders, and pivotal or swinging connections between said leaf-holders and said back, and also between the leaf-holders and said covers, said rigid back being provided with relatively adjustable sections permitting the back to automatically adjust itself, and thereby fit any dimension to which the said leaf-holders are adjusted.

699,280. TRAVELING ROCKING-HORSE. ROY BARRETT, Pat. N.Y. Filed July 13, 1901. Serial No. 68,706. (No model.)

Claim.—1. A device of the character described comprising two side frames and each consisting of front and rear hinged sections forming parts of an animal figure, each section being mounted upon a rocker, the rockers of the sections being adapted to slide past one another, connections between the counterpart sections of each side frame, a seat carried by the front sections, and weighted levers attached to the front and rear sections, substantially as described.

2. A device of the character described, comprising front and rear hinged sections forming the parts of animal figure, rockers upon which the sections are mounted and adapted to slide one past the other, a chair or seat carried by one of the sections, opposing counterbalancing weights upon the sections, and rolls attached to the front section for drawing the same up to a tilted position when the device is rocked rearwardly, substantially in the manner set forth.

699,281. ARTIFICIALLY-INDUCED DEVICE FOR GAS SERVICE. FIFER, ROBERT E. BAYLE, Englewood, N. J. Filed May 1, 1902. Serial No. 68,466. (No model.)

Claim.—1. An antiluxator for use in connection with gas engine, pumps, and the like, comprising a reservoir provided with a gas-supply and having a chamber for containing a plurality of supply charges, a gas-discharge leading from said chamber, said gas-supply having a restricted opening for the passage of gas to resist the flow thereof into said chamber.

2. An antiluxator for use in connection with gas engine, pumps, and the like, comprising a non-collapsible reservoir provided with a gas-supply and having a chamber for containing a plurality of supply charges, a gas-discharge leading from said chamber, said gas-supply having a restricted opening for the passage of gas to resist the flow thereof into said chamber.

3. An antiluxator for use in connection with gas engine, pumps, and the like, comprising a reservoir provided with a gas-supply and having a chamber for containing a plurality of supply charges, a gas-discharge leading from said chamber, said gas-supply having a restricted opening for the passage of gas to resist the flow thereof into said chamber, and a partition in said reservoir having a restricted opening therein for the passage of gas from one side thereof to the other side.

4. An antiluxator for use in connection with gas engine, pumps, and the like, comprising a reservoir provided with a gas-supply and having a chamber for containing a plurality of supply charges, a gas-discharge leading from said chamber, said gas-supply having a restricted opening for the passage of gas to resist the flow thereof into said chamber, and a partition in said reservoir having a restricted opening therein for the passage of gas from one side thereof to the other side.

5. An antiluxator for use in connection with gas engine, pumps, and the like, comprising a reservoir having a chamber for containing a plurality of supply charges, and a smaller compartment having a restricted opening for the passage of gas to the chamber, and a gas admission and exit, respectively, for the compartment and chamber.

6. An antiluxator for use in connection with gas engine, pumps, and the like, comprising a reservoir having a chamber for containing a plurality of supply charges and a smaller compartment with a restricted opening for the passage of gas to the chamber, a gas-supply communicating with said compartment, and an unrestricted gas-discharge leading from the chamber.

7. An antiluxator for use in connection with gas engine, pumps, and the like, comprising a reservoir having a chamber for containing a plurality of supply charges and a smaller compartment with a restricted opening for the passage of gas to the chamber, and a gas admission and discharge, respectively, for the compartment and chamber, the several openings of the apparatus in immediate relation thereto being valveless.

8. An antiluxator for use in connection with gas engine, pumps, and the like, comprising a reservoir provided with a gas-supply having a capacity for more than a single supply charge, a discharge leading from said chamber, a supply leading therein, and a restricted opening for the passage of gas to resist the flow thereof into said chamber.

699,282. PROCESS OF REDUCING METALS AND PRODUCING ALLOYS THEREOF. BERRY & BLACKBURN, Mount Vernon, N. Y. Filed Feb. 14, 1902. Renewed Mar. 16, 1904. Serial No. 61,500. (No specimens.)

Claim.—1. The process of reducing metals, which consists in exposing a composition thereof to be reduced containing metal and two or more non-metallic elements to the action of heat and a metallic carbide the combined elements of which are capable of combining with the electro-negative constituents of the compound, substantially as described.

2. The process of reducing metals, which consists in exposing a metallic carbide composed to the action of heat and a metallic carbide, the combined elements of which are capable of uniting with the electro-negative constituents of the material to be reduced.

3. The process of reducing metals, which consists in exposing a metallic carbide to the action of heat and a metallic carbide the combined elements of which are capable of abstracting the oxygen and fluorine.

4. The process of reducing metals and producing alloys thereof which consists in heating a mixture containing two or more metals combined with oxygen and haloid element, with a metallic carbide the combined elements of which are capable of abstracting the oxygen and haloid elements thereby liberating the metals and producing alloys thereof.

5. The process of reducing aluminum which consists in exposing aluminum oxyfluoride to the action of heat and a metallic carbide, the combined elements of which will unite with the oxygen and fluorine.

6. The process of reducing aluminum, which consists in exposing aluminum oxyfluoride to the action of sodium carbide and heat.

7. The process of reducing aluminum, which consists in introducing into an inert molten bath a mixture of aluminum oxyfluoride and a metallic carbide, the combined elements of which are capable of abstracting the oxygen and fluorine.

8. The process of reducing metals, which consists in exposing a compound to be reduced containing a metal and two or more non-metallic elements to the action of heat and a metallic carbide the combined elements of which are capable of combining with the electro-negative constituents of the compound.

9. The process of reducing metals which consists in exposing at a reducing temperature a composition containing metal and two or more non-metallic elements to the action of a carbide the combined elements of which are capable of combining with the electro-negative constituents of the composition.

10. The process of reducing aluminum which consists in extracting aluminum from a compound thereof containing associated elements capable of uniting with the combined elements of a carbide, by exposing said compound at a reducing temperature to the action of a carbide.

699,283. FENCE. EDWARD ROYER, Upper Sandusky, Ohio. Filed July 17, 1901. Serial No. 68,068. (No model.)

Claim.—In a fence, the combination of a base provided with a supporting transverse recess and having notches at opposite sides of the same, a fence-post having a tapered lower end fitted in the recess of the base

and provided at its side edges with notches located at opposite sides of the post and arranged in alignment with the notches of the base, and the fit controlling the base and engaging the said notches whereby the post is locked in the recess of the base and is permitted a limited lateral movement, substantially as described.

699,284. MOTOR-VEHICLE. JOHN E. GALT, Kansas City, Mo. Filed June 14, 1901. Serial No. 64,508. (No model.)

Claim.—1. In a driving attachment for a vehicle, the combination with a motor, of a spur-wheel operated by the motor, a toothed track arranged to be engaged by the spur-wheel and adapted to fit upon the inner side of the rim of a wheel, and means for securing the track to said rim.

2. In a motor-vehicle, the combination with a driven wheel, of a pinion-shaft having pinions secured thereto, connections between the pinion-shaft and the hub of the driven wheel, a motor secured upon the vehicle, gear connections between the motor and the rim of the wheel, and a clutch included in said connections for disconnecting the motor from the driven wheel.

3. In a motor-vehicle, the combination with a driven wheel, of an explosive-engine supported upon the vehicle, connections between the engine and the wheel, said connections including a shaft carrying a clutch which comprises separate members, a valve for the explosive-engine, and operating mechanism for the valve, said mechanism including a lever and a projection attached to one of the clutch members and adapted to engage the lever upon the rotation of the shaft.

4. In a driving attachment for vehicles, the combination with a motor, of a clamp having a rigid connection with one end of the motor and arranged to be secured to the frame-bar of a vehicle contiguous to one of the wheels thereof, and extensible means located at the opposite end of the motor for securing the same to another frame-bar.

5. In a driving attachment for a vehicle, the combination with a motor, of an upright clamp having a rigid connection at one end of the motor and arranged to be secured to the upright frame-bar of a bicycle contiguous to the driving-wheel thereof, a clamp arranged to be secured to the head-bar of a bicycle, and an extensible connection between the last-named clamp and the motor.

6. In a driving attachment for a vehicle, the combination with a motor, of a spur-wheel operated by the motor, a toothed track arranged to be engaged by the spur-wheel, and means for adjustably securing the track to the rim of a vehicle-wheel.

7. In a driving attachment for a vehicle, the combination with a motor, of a spur-wheel operated by the motor, a toothed track arranged to be engaged by the spur-wheel and provided with slots and devices for re-

oring said track to the rim of the vehicle, said device passing through the slot, whereby the track will be adjustably secured to the wheel.

8. In a driving attachment for a vehicle, the combination with a motor, of a spur-wheel operated by the motor, a track arranged to be engaged by the spur-wheel, said track comprising a ring having a plurality of spaced and laterally offset teeth that intermesh with the spurs of the wheel, and means for securing said track to a vehicle-wheel.

9. In a driving attachment for a vehicle, the combination with a motor, of a spur-wheel, a clutch connection between the motor and the spur-wheel, means for operating the clutch, a track arranged to be engaged by the spur-wheel, and means for securing said track to a vehicle-wheel.

10. In a motor vehicle, the combination with the vehicle, of a continuous track secured to a wheel of the vehicle, a motor carried by the vehicle, a spur-wheel having an operative engagement with the track, clutch connection between the motor and the spur-wheel, and means for operating the clutch.

11. In mechanism of the class described, the combination with a motor, of a shaft operatively connected with the motor, a spur-wheel mounted upon the shaft, a clutch connection between the shaft and spur-wheel, means for operating the clutch, a track arranged to be engaged by the spur-wheel, and means for securing said track to a vehicle-wheel.

12. In mechanism of the class described, the combination with a motor, of a shaft operatively connected with the motor, a sleeve rotatably mounted on the shaft, a clutch connection between the sleeve and shaft, means for operating the clutch, a spur-wheel secured to the sleeve, a track arranged to be engaged by the spur-wheel, and means for securing the said track to a vehicle-wheel.

13. In mechanism of the class described, the combination with a motor, of a shaft operatively connected with the motor, a sleeve rotatably mounted on the shaft, a flanged friction-disk secured to the shaft at one end of the sleeve, a collar slidably mounted upon the sleeve and carrying a track arranged to engage the flange of the disk, means for sliding the collar, a spur-wheel secured to the sleeve, a track arranged to be engaged by the spur-wheel, and means for securing said track to a vehicle-wheel.

14. In mechanism of the class described, the combination with a motor, of a journal secured to the opposite end of the engine, a motor-shaft mounted in the journal at one end of the motor, a driving-shaft mounted in the journal at the opposite end of the motor, means operatively connecting the motor and driving-shaft, and driving mechanism connecting said driving-shaft and a vehicle-wheel.

15. In mechanism of the class described, the combination with a motor, of a journal secured to opposite sides of the motor, a motor-shaft mounted in the journal at one end of the motor, a driving-shaft mounted in the journal at the opposite end of the motor, means operatively connecting the motor and driving-shaft, and driving mechanism connecting said driving-shaft and a vehicle-wheel, said mechanism including a clutch and means for operating said clutch.

16. In an attachment of the class described, the combination with an explosive-engine, of a carburetor suspended beneath the same, a fuel-receptacle supported upon and located above the engine, driving mechanism carried by and connected with the engine, and means for securing the attachment to a vehicle.

17. In an attachment of the class described, the combination with an explosive-engine, of a carburetor secured to and suspended beneath said engine, a fuel-receptacle supported upon the engine, driving mechanism carried by and connected with the engine, a blower secured at one end of the engine and connected to the driving mechanism, means for directing the current of air from the blower over the engine, and clamps secured to the attachment for fastening the same to a vehicle.

18. In mechanism of the class described, the combination with an engine and valve therefor, of an engine-shaft located transversely across one end of the engine and having an operative connection therewith, a driving-shaft located transversely across the opposite end of the engine, connection between the engine-shaft and driving-shaft, valve-operating mechanism carried by said driving-shaft, and means for connecting the driving-shaft to a vehicle.

19. In a driving attachment for vehicles, the combination with a motor, of a clamp secured to one end of the motor, an adjustable clamp located at the other end of the motor, and a turnbuckle connection between the latter clamp and the motor.

20. In an attachment of the class described, the combination with a motor, of a clamp for securing the motor to a vehicle, a driving-shaft mounted upon the clamp, connection between the motor and the driving-shaft, and means for connecting the driving-shaft to a vehicle-wheel.

21. In an attachment of the class described, the combination with a motor, of a two-part clamp, one part of which is attached to the motor, a driving-shaft mounted upon said attached part, connection between the motor and the driving-shaft, and means for connecting the driving-shaft to a vehicle-wheel.

699,285. CORE-BOX CUTTER. BRYAN L. CLOVER and ARTHUR GRADOWSKI, Chicago, Ill. Filed May 2, 1901. Serial No. 29,228. (No model.)

Claim.—1. In core-box cutters, the combination with a movable frame adapted to travel upon the surface of the work, of a cutter revolvably mounted in said frame to rotate in a plane at right angles to the travel thereof, an operating-shaft for said cutter journaled in the frame and flexible driving mechanism connected to said shaft.

2. In core-box cutters, the combination with a movable frame adapted to travel upon the surface of the work, of a cutter revolvably mounted thereon arranged to shape a core-box groove in such section below the surface thereof, an operating-shaft for said cutter mounted in the frame and flexible driving mechanism connected to said shaft.

3. In core-box cutters, the combination with a movable frame adapted to travel upon the surface of the work, of a cutter revolvably mounted thereon arranged to shape a core-box groove in such section below the surface thereof, flexible driving mechanism connected to said cutter and a pattern-guide for controlling the travel of said frame.

4. In core-box cutters, the combination with a movable frame adapted to travel upon the surface of the work, of a revolvable cutter and an operating-shaft therefor, carried by said frame, flexible driving mechanism connected to said operating-shaft, gaging-supports for said frame and adjustable eccentricities for said supports whereby the cutter is held in proper relation with its work.

5. In core-box cutters, the combination with a movable frame adapted to travel upon the surface of the work, of a cutter revolvably mounted in said frame to rotate in a plane at right angles to the travel thereof, an operating-shaft for said cutter carried by the frame and adjustable gaging-supports for said frame, whereby said cutter may be adjusted to its work.

6. In a core-box cutter, the combination with a movable frame having wheels for supporting the same upon the surface of the work, of a cutter revolvably mounted in said frame to rotate in a plane at right angles to the travel thereof, an operating-shaft for said cutter carried by the frame, flexible driving mechanism connected to said operating-shaft, and adjustable eccentric bearings for said supporting-wheels to raise and lower the frame, whereby said cutter may be adjusted to its work.

7. The combination with a movable frame adapted to travel upon the surface of the work and with a revolvable cutter and operating-shaft therefor carried by the frame, of a flexible pattern-guide for controlling the travel of said frame.

8. The combination with a movable frame adapted to travel upon the surface of the work, of a cutter revolvably mounted in said frame to rotate in a plane at right angles to the travel thereof, an operating-shaft for said cutter carried by the frame, flexible driving mechanism connected to said operating-shaft, and means for guiding the travel of said frame.

9. The combination with a flexible pattern-guide adapted to be adjustably fixed in place, of a movable frame having means for engaging said guide, a cutter revolvably mounted in said frame to rotate in a plane at right angles to the travel thereof, an operating-shaft for said cutter car-

ried by said frame and flexible driving mechanism connected to said operating-shaft.

10. The combination with a flexible pattern-guide adapted to be adjustably secured to the surface of the work, of a movable frame adapted to travel upon the surface of the work having wheels for tracking on said pattern-guide, and a revolvable cutter and operating means therefor mounted on said frame.

11. The combination with a flexible pattern-guide adapted to be adjustably secured to the surface of the work, of a movable frame having wheels for tracking on said pattern-guide, a cutter revolvably mounted in said frame to rotate in a plane at right angles to the travel thereof, an operating-shaft for said cutter carried by the frame, flexible driving mechanism connected to said operating-shaft, and means for adjusting said guide-wheels to raise and lower said frame, whereby said cutter may be adjusted to its work.

12. In core-box cutters, the combination with a movable frame adapted to travel upon the surface of the work, of a revolvable cutter and operating means therefor carried by the frame, gaging-supports for said frame to hold the cutter in proper relation with its work, a blower and operating means therefor carried by the frame, and means for directing the blast from said blower in front of said gaging-supports.

13. In core-box cutters, the combination with a movable frame adapted to travel upon the surface of the work, of a revolvable cutter and operating-shaft therefor on said frame, adjustable supporting-wheels for said frame to hold the cutter in proper relation with its work, a blower carried by said frame and arranged to be driven from said operating-shaft, and means for directing the blast from the blower in front of said adjustable supporting-wheels.

14. In core-box cutters, the combination with a movable frame having supporting-wheels and adapted to travel upon the surface of the work, of a stud-shaft mounted in said frame to rotate in a plane at right angles to the travel thereof, an operating-shaft carried by the frame at right angles to said stud-shaft, a revolvable cutter removably secured to said stud-shaft, interengaging beveled gears fixed to said stud-shaft and to said operating-shaft, and means for coupling said operating-shaft to a flexible drive-shaft.

15. In core-box cutters, the combination with a movable frame adapted to travel upon the surface of the work, of a stud-shaft and an operating-shaft revolvably mounted in said frame, a revolvable cutter carried by said stud-shaft and interengaging gears on said stud-shaft and said operating-shaft, adjustable supports for raising and lowering said frame to adjust said cutter to its work, a blower carried by said frame, a friction-wheel on the shaft of said blower, a friction drive-wheel engaging the same fixed to said operating-shaft, and means for directing the blast from said blower in front of said adjustable supports.

16. In core-box cutters, the combination with a movable frame having supporting-wheels and arranged to travel upon the surface of the work, of a stud-shaft mounted on said frame to rotate in a plane at right angles to the travel thereof, a cutter removably secured to said stud-shaft, an operating-shaft carried by the frame at right angles to said stud-shaft, interengaging beveled gears fixed to said stud-shaft and to said operating-shaft, means for adjusting said supporting-wheels for raising and lowering said frame to hold said cutter in proper relation with its work, a centrifugal blower carried by said frame, a friction-wheel on the shaft of said blower, a friction drive-wheel engaging the same and fixed to said operating-shaft, means for directing the blast from said blower in front of said supporting-wheels, means for coupling said operating-shaft to a flexible drive-shaft and means for controlling the travel of said frame.

17. In core-box cutters, the combination with a frame arranged to move over the surface of the work, of a cutter revolvably mounted on said frame to rotate in a plane at right angles to the travel thereof, an operating-shaft for said cutter carried by the frame, means for driving said shaft during the movement of the frame and means for guiding the movement of the frame, substantially as described.

699,286. CORRUGATED SHEET-CLAMP AND WAIST-RETAINER. WILLIAM C. CUFF-HOLDER, Chicago, Ill. Filed May 14, 1901. Serial No. 29,229. (No model.)

Claim.—1. A shirt-clamp and waist-retainer comprising a hook-plate and an eye-plate, pivoted joint-supporting hooks carried by the hook-plate, and locking means carried by one of the pivoted hooks to embrace and hold the two plates assembled.

2. A shirt-clamp and waist-retainer comprising a plate provided with a plurality of hooks, a plate having a plurality of eyes to engage the hooks, and two pivoted joint-supporting hooks carried by one of the plates, one of the latter hooks having a catch to embrace the upper

edges of the two plates to hold them assembled against accidental separation.

3. A shirt-clamp and waist-retainer comprising two plates one of which is provided with a plurality of eyes, and the other with a plurality of hooks to engage the eyes, the latter plate carrying on the side opposite that on which the hooks are arranged two pivoted hooks to engage with openings in the waist of the garment, one of the hooks being provided with a curved projection to bear upon the upper edge of the two plates and thus hold them locked against accidental separation.

4. A shirt-clamp and waist-retainer comprising two plates one of which is provided with a plurality of eyes, and with incuts or depressions upon its upper edge, and the other provided with rigid hooks extending outward from the face of the plate, and with an incut or depression upon its upper edge and with two pivoted hooks arranged on the opposite side of the plate to that carrying the rigid hooks, one of the hooks being provided with a curved offset to engage with the depressions formed in the upper edges of the two plates.

5. A waist provided at the waist-line with a perforated plate secured thereto, in combination with a skirt carrying a plate provided with hooks to engage with the perforations of the waist-plate, the second-named plate being provided with outwardly-extending hooks, a third plate carried by the free end of the skirt to engage the outwardly-extending hooks, and locking means carried by one of the first-named hooks and the second-named plate for holding the two plates assembled.

6. A device of the class described, comprising two interlocked members, pivoted locking means to hold the two members in interlocked relation, and means carried by the locking means for supporting the skirt.

7. A device of the class described, comprising a pair of members having detachable interlocking means, a pivotal locking device carried by one of the members and constructed to hold the latter against separation when interlocked, and a pivotal support carried by the outer side of said member.

699,287. CUFF-HOLDER. WILLIAM C. CUFF-HOLDER, Chicago, Ill. Filed May 16, 1901. Serial No. 29,230. (No model.)

Claim.—1. A cuff-holder, comprising a sleeve member, and a cuff member separate from and detachably connected to the sleeve member, and comprising a pair of intermediately-pivoted members working in substantially parallel planes, one set of corresponding ends of the members being constructed to detachably engage the sleeve member, and the opposite set of corresponding ends of the members being constructed to prevent accidental separation of the first-named ends and capable of manual operation to separate said first-named ends for the purpose of detaching the same from the sleeve member, and a cuff-button carried by the cuff member.

2. A cuff-holder, comprising a sleeve member, and a cuff member, the latter having a pair of intermediately-pivoted members which work in substantially parallel planes, the opposite ends of each member being deflected laterally in the same direction to lie at one side of the plane of the member, whereby the corresponding ends of the pivotal members are adapted to abut and limit the pivotal movement of said members, one set of corresponding ends being constructed to detachably engage the sleeve member, and the opposite set of corresponding ends being capable of being sprung past each other to permit separation of the first-named ends, and a cuff-button carried by the cuff member.

3. A cuff-holder comprising two members pivoted together, each member being provided at one end with an arm, at the opposite end with an inward toe, and intermediate of its ends with a shoulder or offset, the shoulders, when the members are closed, to be engaged by suitable cuff-holder-supporting means, and the members to be held in locked engagement by abutting reaction between the curved toes.

4. A cuff-holder comprising two members, a pivot connecting a cuff-button connecting the two members, each member being provided at one end with an inward toe, at the other end with an arm and intermediate of its ends with a shoulder or offset, the two shoulders, when the members of the device are closed, to be engaged by a suitable cuff-holder-supporting means, and the members to be held in locked engagement by abutting reaction between the curved toes.

5. A cuff-holder comprising two members each constructed of a thin strip of metal, and provided at one end with an inward toe, and at the opposite end with an arm, a shoulder arranged intermediate of the ends of the member and extending at right angles to the arm, and a pivot for holding the two members assembled, the pivot being provided with a hook to bear upon one of the members and with a head to engage the bottom-hole of the cuff, the shoulders, in the operation of the device, being engaged by the loop of a safety-pin and the two members being held in locked engagement by reaction between the curved toes.

6. A cuff-holder, comprising a safety-pin, a cuff element embodying

near the bottom of the cylinder, a standard secured to the platform and to the cylinder, and constituting a bearing for the piston-rod of the air-pump, a shaft supported by the standard and carrying a sprocket-wheel and a disk, a piston-rod connecting the disk and the piston-rod, and a sprocket-chain engaging the latter sprocket-wheel and the sprocket-wheel of the supporting-axis.

699,298. MAP OR CHART CASE. JOHN H. DOLBY, Providence, R. I. Filed Feb. 3, 1902. Serial No. 92,261. (No model.)

Claim.—In a device of the character described, the combination of a rotatable shaft; a pair of similar polygonal bands secured transversely on the shaft; longitudinal members each having one end removably secured to one of the bands; and trip-rolls mounted on the inner face of the said members and parallel with said shaft.

699,294. APPARATUS FOR AERATING OR AGITATING LIQUIDS. HAROLD E. DRAKE, Birmingham, near Liverpool, England. Filed Jan. 17, 1902. Serial No. 92,212. (No model.)

Claim.—1. In apparatus for aerating or agitating liquids, the combination with the vanes or coils of a feed-pipe for delivering liquid under pressure into the bottom of each cell, a run-off pipe for discharging liquid from the cells, an injecting-nozzle in the feed-pipe, and a fluid-orifice arranged immediately adjacent to said nozzle in such a manner, that the liquid issuing from the nozzle at high velocity sets up an induced current of fluid through the fluid-orifice, with which the jets of liquid mingle and is delivered into the cell, causing a very efficient and constant agitation therein, substantially as described.

2. In apparatus for aerating or agitating liquids, the combination with the vanes or coils of a feed-pipe for delivering liquid under pressure into the bottom of each cell, a run-off pipe for discharging liquid from the cells, an injecting-nozzle in the feed-pipe and a branch pipe leading from the adjacent cell to the said feed-pipe at a point adjacent to the nozzle in such a manner that the liquid issuing from the nozzle at high velocity sets up an induced current of liquid through the branch pipe, with which the jet issuing through the nozzle mingles and is delivered into the cell, causing a very efficient and constant agitation therein, substantially as described.

3. In an apparatus for aerating or agitating liquids, the combination of a storage-tank for the liquid, a series of vanes, a main supply-pipe leading from said storage-tank, a depending feed-pipe for each vat connected with the main pipe, the nozzle of the feed-pipe being constructed, a casing surrounding the nozzle and leading into the vat, an orifice in said casing contiguous to the nozzle of the feed-pipe for causing an induced current of air, and a duct for each cell communicating with a main pipe for discharging the liquids in the cell, substantially as described.

4. In an apparatus for aerating or agitating liquids, the combination of a storage-tank for the liquid, a series of vanes, a main supply-pipe leading from the storage-tank, a feed-pipe for each vat connected with the main supply-pipe, the nozzle of the feed-pipe being constructed, whereby the liquid will issue from the nozzle at high pressure, a casing or barrel surrounding the nozzle of the feed-pipe, orifices in the casing contiguous to said nozzle, whereby the liquid issuing from the nozzle at high pressure will cause an induced current of fluid through said orifices, substantially as described.

699,295. FICKER. THOMAS F. DUNE, Boston, Mass. Filed Jan. 10, 1902. Serial No. 92,199. (No model.)

Claim.—1. In combination with a necktie of the character described, an attachable and detachable band adapted to be applied to the tie at the point where the knot is usually produced, laterally and when open, and to be secured around and encircle said tie by clamping the opposite ends of said band together, and to be removed from said tie by unclamping said ends, opening out the band and withdrawing it laterally from the tie; and means for engaging the band with the tie by the act of clamping said ends whereby it may be prevented from dropping out of such position, substantially as described.

2. In combination with a necktie of the character described, an attachable and detachable band adapted to be applied to the tie at the point where the knot is usually produced, laterally and when open, and to be secured around and encircle said tie by clamping the opposite ends of said band together and to be removed from the tie by unclamping said ends, opening out the band and withdrawing it laterally from the tie; metallic strips secured to the opposite ends of the band substantially parallel with said ends; clamping devices extending outward from said strips for engagement with each other when the band is closed; and means for engaging the band by the act of clamping its ends whereby it is prevented from dropping out of its position around the tie, substantially as set forth.

3. In combination with a necktie of the character described, the band comprising a base of relatively stiff material and a covering of ornamental material; the strips E, F secured to the opposite ends of the band; the dotted extension H, H' provided with the teeth J, J' and extending from the strip E beyond the edge of the band; and the hook F' extending from the strip F and adapted to engage the extension H by means of one of its slots H', substantially as described.

699,296. APPARATUS FOR DESTROYING GASES. JOHN H. HUNTER, Waltham, Mass. Filed Jan. 7, 1901. Serial No. 92,311. (No model.)

Claim.—1. In an apparatus of the class described, a closed chamber partially filled with water, a pipe to receive the products of combustion and exhaust-steam from an engine, said pipe extending into the closed chamber below the surface of the water, a steam-jacket for exhausting the air from the chamber, the exhaust-pipe from the jacket passing through the water in the closed chamber.

2. In a steam-engine, a vacuum-chamber partially filled with water, a pipe to receive the products of combustion and exhaust-steam from the engine, said pipe extending into the vacuum-chamber and below the surface of the water, a steam-jacket for exhausting the air from the vacuum-chamber, the exhaust-pipe of said jacket being branched and one branch leading through the water in the closed chamber and the other branch passing back to the combustion-chamber of the furnace, and valves to control said pipes.

3. In apparatus of the class described, a closed chamber partially filled with water, a pipe to receive waste product, said pipe extending into the closed chamber below the surface of the water, a steam-jacket for exhausting the air from the chamber, and means to condense the steam in the exhaust-pipe from the jacket.

699,297. KEEL-CUSHION. OTTO BAX, Baltimore, Md. Filed Mar. 12, 1901. Serial No. 91,908. (No model.)

Claim.—1. A keel-cushion, provided on its under side with a flap adapted to be attached to the inside of a shoe, and also provided with a shoulder adapted to abut against said flap, whereby to prevent the forward displacement of the cushion; and a resilient connection between said cushion and flap.

2. A keel-cushion, provided on its under side with a flap adapted to be attached to the inner sole of a shoe, and also provided with a shoulder adapted to abut against said flap whereby to prevent the forward displacement of the cushion.

3. A keel-cushion, provided on its under side with a flap adapted to be permanently attached to the inside of a shoe and said flap having a resilient connection with said cushion; and one or more elastic pads attached to the bottom of the cushion and adapted to abut against the rear edge of said flap whereby to prevent the forward displacement of the cushion.

4. A keel-cushion, comprising a bottom plate and a top plate one of which is secured to the other at its forward end only; a layer of cork secured to the inner surface of one of said plates at the rear end thereof; and a layer of felt wedged between said plates and secured thereto at its forward edge only whereby the rear ends of said plates tend to spring apart.

5. A keel-cushion, comprising a bottom plate and a top plate one of which is secured to the other at its forward end only; and an elastic filling having its forward end in contact with and wedged between the said bottom and top plates, and having its rear portion free from attachment to said two plates, whereby said filling tends to spread the rear ends of said plates apart.

699,298. STRIPS FOR SHAY-BUTTON. WILLIAM STYER, Ashland, Ohio. Filed July 12, 1901. Serial No. 92,311. (No model.)

Claim.—1. The combination with a frame and a plurality of springs arranged in rows, of a plurality of tie-strips of sheet metal having bands forming seats at their ends, the coils of adjoining springs being seated in said seats, said strips having openings in the bent portions, and straight

wires or rods threaded through said openings and holding the coils in the seats or bands, substantially as described.

2. The combination with a frame and a plurality of springs arranged in rows, of a plurality of tie-strips of sheet metal each having V-shaped bands at its ends engaging the coils of two adjacent springs, said strips having slots formed in said bent portions from the apex of the V inward, and straight wires or rods threaded through said slots for holding the springs in the bands, substantially as described.

699,299. TYPE-WRITER. FRED H. FRY, Fort Worth, Tex. Filed May 21, 1897. Serial No. 92,502. (No model.)

Claim.—1. A type-writer-carriage-returning mechanism adapted to operate independently of the carriage-advancing mechanism consisting of a cord-winding drum having a clutch-jaw integral therewith, a cord attached to said drum and to the carriage-rod, a second clutch-jaw adapted to cooperate with said first-named clutch-jaw mounted rigidly on the shaft of said winding-drum, means for throwing said clutch-jaws in and out of mesh consisting of a key mounted in the keyboard and suitable levers and connecting devices, a pinion mounted rigidly on said shaft, a spring-actuated cog-wheel for driving said pinion, and means for locking said last-named clutch-jaw against rotation.

2. The combination with the type-writer carriage of a drum containing a coiled spring, said drum having cogs integral therewith, a pinion meshing with said drum, a clutch-jaw, means for locking said clutch-jaw in a stationary position, a cord-winding drum having a clutch-jaw integral therewith and loosely mounted on a suitable shaft, a cord connected to said drum and to the carriage-rod, means for throwing said clutch-jaw in and out of mesh and simultaneously releasing and locking said first-named clutch-jaw, whereby said carriage is returned to starting position.

3. The combination with the type-writer carriage provided with suitable advancing mechanism of a carriage-returning mechanism, said mechanism consisting of a cord-winding drum having a clutch-jaw integral therewith, a cord attached to said drum and to the carriage-rod at the opposite end to which the cord for advancing said carriage is attached, a shaft on which said drum is loosely mounted, a clutch-jaw rigidly mounted on said shaft having a series of apertures in the end thereof, a disk having two plugs adapted to engage two of said apertures for locking said clutch-jaw stationary, a spring mounted on said shaft between said clutch-jaws adapted to separate said clutch-jaws, a spring-actuated cog-wheel adapted to drive said last-described jaw, means for throwing said clutch-jaws in and out of mesh and simultaneously releasing and locking respectively said last-described clutch-jaw.

4. In an attachment for returning the carriage of a type-writer, a cord-winding drum, a spring-actuated drum, suitable gearing by which said cord-winding drum is operated by said spring-actuated drum, a cord attached to said first-named drum and to the carriage-rod at the opposite end to which the cord for advancing the carriage is attached, compound levers for connecting and disconnecting said drums through said gearing and a button for operating said levers.

5. In a type-writer provided with a suitable component mechanism for driving the carriage from right to left; means for returning said carriage to starting-point consisting of a cord attached to the left side of the carriage-frame, a drum for winding said cord, a second drum provided with a suitable spring for retaining said first-named drum, a clutch for locking said drums, and a key provided with suitable connecting-levers for operating said clutch whereby said carriage can be started or stopped at any point in the line thereof.

6. In a type-writer provided with a suitable component mechanism for driving a carriage from right to left; the combination with means for returning said carriage to the right, of line-moving mechanism consisting of a rock-shaft mounted on the carriage-frame, a lever mounted rigidly on said shaft and provided with a finger pivoted thereon for rotating the plate-roller, a handle mounted on said shaft, and a trip mounted on the

type-writer frame for operating said handle, said handle being adapted to pass over said trip going to the left without rocking said shaft and in rock said shaft when going to the right.

7. In a type-writer provided with component mechanism for driving the carriage from the right to the left; means for returning said carriage to the right consisting of a cord attached to the left side of the frame of said carriage, a drum for winding said cord, a spring-drum for operating said drum, clutch-jaws for locking said drums, and means for throwing said clutch-jaws in and out of mesh consisting of a yoke on one side of said clutch-jaws, a disk on the other side thereof, said yoke having arms attached to said disk, said disk having flaps for inserting in the apertures in the adjacent clutch-jaw, a lever having two prongs or arms attached to said disk, means for operating said lever, and a spring between said clutch-jaws.

699,800. TELESCOPE-MOUNT. BRANLEY A. PINK, U. S. NAVY. Filed Oct. 29, 1901. Serial No. 99,418. (No model.)

Claim.—1. A telescope and a support therefor, the said telescope being mounted on a pivot and having its eyepiece in the line of said pivot.

2. The combination of a telescope pivoted for vertical motion and having its eyepiece in the line of its pivot, and a supporting-carriage pivoted for motion in azimuth.

3. A telescope, a carriage therefor, the said telescope being pivoted to said carriage at its eyepiece end and a head-rest on said carriage, disposed above said eyepiece.

4. A telescope, a carriage therefor, the said telescope being pivoted to said carriage at its eyepiece end and means for counterbalancing the free end of said telescope.

5. The combination of the carriage K, standards G thereon, telescope A pivoted at its eyepiece end in said standards and means supported on said carriage for counterbalancing the free end of said telescope.

6. The combination of the carriage K, standards G thereon, telescope A pivoted at its eyepiece end in said standards, means supported on said carriage for counterbalancing the free end of said telescope, a lever H for turning said telescope on its pivot, the said counterbalancing means and lever H being connected to said telescope on opposite sides of said pivot.

7. The combination of the carriage K, standards G thereon, telescope A pivoted at its eyepiece end in said standards, means supported on said carriage for counterbalancing the free end of said telescope, and a head-rest V supported on said standards G and above said eyepiece.

8. The combination of the carriage K, standards G and tubes O thereon, a telescope A pivoted at its eyepiece end in said standards and counterbalance-weights connected to said telescope and suspended in said tubes.

9. The combination of a carriage, arms pivoted at one end on said carriage, a telescope A supported by said arms, and means for counterbalancing said telescope.

10. The combination of a carriage, arms pivoted at one end in said carriage, a telescope supported by said arms, and detachably connected thereto, and means for counterbalancing said arms and telescope detachably connected to the said carriage.

11. The combination of the carriage K, standards G thereon, telescope A pivoted at its eyepiece end in said standards, means supported on said carriage for counterbalancing said telescope, and an arm H for turning said telescope on its pivot.

12. In combination with a telescope-mount having a carriage movable about a vertical pivot and two standards, on said carriage, a telescope supported on a horizontal pivot between said standards, and having its eyepiece in the line of said horizontal pivot.

699,801. COMBINED LOCK AND LATCH. HOWARD A. FORD, Burlington, Iowa. Filed Oct. 8, 1901. Serial No. 77,361. (No model.)

Claim.—1. The combination with a casing, a slidable latch-bolt having a longitudinal slot, and a coiled spring adapted to normally project the latch-bolt at one end from the casing, of a dog in bar form, having a laterally-hooking toe at one end and pivoted between its ends in the slot, so as to rock on the latch-bolt, a spring held between the latch-bolt and dog, normally pressing its toe outwardly, and a cam rockable in the casing at the rear of the dog and adapted to press its edge laterally on the inner end of the dog to retract its toe within the latch-bolt.

2. The combination with a casing, a slidable latch-bolt having parallel guide-rod thereon, and a longitudinal slot therein, and springs mounted on the guide-rod which press the latch-bolt outwardly, of a dog having a lateral toe at one end and pivoted to rock in the slot of the latch-bolt, a cam in plate form rockable in the casing at the rear of the dog, the edge of said cam being adapted to press laterally on the dog to rock it, said cam being adapted to subsequently slide the bolt against stress of the springs.

3. The combination with a casing, and a slidable latch-bolt in said casing having a latching-ear, of a dog pivoted to the bolt between its ends, a lateral toe on the end of the dog, a spring pressing the toe beyond one side of the nose, and manually-operated means for rocking the dog to withdraw the toe and subsequently retract the latch-bolt, said means being operative from either side of the lock-casing.

4. In a combined latch and lock, the combination of a casing, a strike-plate, a spring-pressed latch-bolt, a rockable dog mounted on the latch-bolt and adapted to interlock with the strike-plate when the latch-bolt is engaged therewith, a stub-spindle rockable in each side wall of the casing, and a cam-plate on each spindle, which will independently depress the dog for its release from the strike-plate, when the spindle that carries said cam-plate is rockably moved.

5. In a combined latch and lock, the combination of a casing, a strike-plate, a spring-pressed latch-bolt slidable in the casing for engagement of its nose with the strike-plate, a rockable dog on the latch-bolt, spring-pressed at one bent end to interlock said end with the strike-plate when the latch-bolt is engaged therewith, two stub-spindles oppositely held to rock in respective sides of the casing, a cam-plate on each spindle, each adapted to independently rock the dog for its release from the strike-plate when the spindle carrying said cam-plate is rocked, cam-wings on each cam-plate, and arms carried by the latch-bolt, whereon said cam-wings on the cam-plates have spring-pressed contact.

699,802. GRINDING-WHEEL. GEORGE E. POWLER and WILLIAM D. HOWE, Cortland, N. Y. Filed May 14, 1901. Serial No. 60,173. (No model.)

Claim.—1. A grinding-wheel comprising a reinforcing-ring embedded therein and laterally-projecting spurs connected with the ring.

2. A grinding-wheel comprising concentrically-arranged reinforcing-rings embedded therein and radial ties connecting the rings.

3. A grinding-wheel comprising concentrically-arranged reinforcing-rings embedded therein, laterally-projecting spurs connected with the rings and radial ties connecting the rings.

699,803. CHIMING-MECHANISM FOR CLOCK. THOMAS J. FOX, Boston, Mass., assignor to Rogers, Lamart & Co., Boston, Mass., & Fox. Filed Nov. 14, 1901. Serial No. 82,382. (No model.)

Claim.—1. In a chiming-clock, the combination with a time mechanism, of the chimino, a hammer mechanism therefor, a chime-cylinder having pins for actuating the hammer mechanism, means permanently geared to the chime-cylinder for rotating it, means whereby the pins on the chime-cylinder and the hammer mechanism may be thrown into and out of operative relation with respect to each other, and means for periodically releasing or setting in action the chime-cylinder-rotating mechanism from the time mechanism to sound the chimino, whereby, when the cylinder-pins and the hammer mechanism are thrown out of operative relation, the periodical revolution of the said cylinder will continue in regular order with respect to the hammer-operating mechanism.

2. In a chiming-clock, the combination with a time mechanism, of the chimino, a hammer mechanism therefor, a chime-cylinder having pins for actuating the hammer mechanism, means for moving the cylinder bodily to throw its pins into and out of the path of the hammer mechanism, means permanently geared to the chime-cylinder for rotating it, and means for periodically releasing or setting in action the chime-cylinder-rotating mechanism from the time mechanism to sound the chimino, whereby when the chime-cylinder is moved to throw its pins out of operative relation with the hammer mechanism, its periodical revolutions will continue in regular order with respect to the hammer-operating mechanism without disturbing the relative relation of its pins to the hammer-actuating mechanism.

3. In a chiming-clock, the combination with a time mechanism, of the chimino, a hammer mechanism therefor including hammer-levers, a longitudinally-movable chime-cylinder provided with a series of pins for actuating the hammer-levers, means for moving the cylinder longitudinally to throw its pins into and out of the paths of said hammer-levers, means permanently in gear with said chime-cylinder for rotating the same, means for periodically releasing or setting in action the chime-cylinder-rotating mechanism from the time mechanism, whereby longitudinal movement of the chime-cylinder will not interfere with its rotary movement and thus the relative relation of the cylinder-pins and hammer-levers be maintained.

4. In a chiming-clock, the combination with a time mechanism, of the chimino, a hammer mechanism therefor including hammer-levers, a longitudinally-movable chime-cylinder provided with a series of pins for actuating the hammer-levers, a spring holding the cylinder with its pins in register with the hammer-levers, a shut-off lever to move the chime-cylinder against the action of its spring, a wide gear on the chime-cylinder, a driving pinion or gear in permanent mesh with said wide gear and forming part of the chime-train, whereby the chime-cylinder will be rotated whenever released without any relative change between its pins and the hammer-levers, and means for periodically releasing the chime-train from the time mechanism.

699,804. FISHING-BAIT HOLDER. VICTOR GEMARDE, St. Louis, Mo. Filed Nov. 11, 1901. Serial No. 81,878. (No model.)

Claim.—1. The combination with a fish-hook having a plurality of shanks joined at the line-attaching end of the hook, and separate barbed ends, of a bait-holder secured to the fish-hook at its line-attaching end, and consisting of a plurality of members extending toward said barbed ends, said members being bent to cross each other, bent reversely to form bait-engaging hooks, and the members being adapted to be pressed together, whereby the bait-hooks near the barbed fish-hook ends are separated to allow insertion of bait.

2. The combination with a fish-hook, of a bait-holder secured to the fish-hook at its line-attaching end, and consisting of a plurality of members extending toward the barbed end of the fish-hook, said members being bent to cross each other, bent reversely to form bait-engaging hooks, and the members being adapted to be pressed together, whereby the bait-hooks, near the barbed end of the fish-hook, are separated to allow insertion of bait.

699,805. MECHANISM FOR OPERATING ELEVATOR-DOORS. CHARLES E. GILMORE, Chicago, Ill., assignor to the Winslow Bros. Co., Chicago, Ill., a Corporation of Illinois. Filed Oct. 19, 1901. Serial No. 73,128. (No model.)

Claim.—1. In a mechanism for operating elevator-doors, the combination with a slidable door and a normally stationary shaft connected thereto and adapted, by its rotation, to open said door, of shaft-rotating devices connected to said shaft and adapted to be set in motion at the will of the operator; substantially as described.

2. The combination with a slidable door and a normally stationary shaft connected thereto and adapted by its rotation in one direction to open said door and in the opposite direction to close the same, of devices for rotating said shaft in both directions, and means for throwing said shaft-operating devices in action at the will of the operator; substantially as described.

3. The combination with a slidable door and a normally stationary shaft adapted by its rotation to open and close said door, of devices for rotating said shaft, means for throwing said devices into gear at will and devices for automatically throwing them out of gear when the door comes to an open or closed position; substantially as described.

4. The combination with a slidable door and a shaft connected thereto, and adapted by its rotation, to open the same, of a pinion upon said shaft, a rack-bar in mesh therewith, slidable devices for advancing said rack-bar to rotate said shaft and devices adjacent to the door adapted to throw the bar-advancing devices into gear at will; substantially as described.

5. The combination with a slidable door and a shaft connected thereto and adapted by its rotation in one direction to open said door and in the opposite direction to close the same, of a pinion upon said shaft, a rack-bar meshing therewith, devices for reciprocating said rack-bar to open and close a door and means for throwing said devices into gear at will; substantially as described.

6. The combination with a slidable door and a shaft adapted, by its rotation in one direction, to open said door, and in the other direction, to

close the cone, of device for rotating said shaft, a clutch for throwing said device into gear, and means upon the shaft-rotating device adapted to automatically release the clutch when the door comes to an open or closed position; substantially as described.

7. The combination with a slidable door and a shaft connected thereto and adapted by its rotation to open said door, of a pinion on said shaft, a rack-bar, a rotatable arm connected to said bar and means for governing the rotation of said arm at the will of the operator; substantially as described.

8. The combination with a rotatable shaft, of a slidable door, a spool, a ribbon connected to the door and adapted to be wound upon the spool to open the door and suitable device for throwing said spool into rotatable engagement with the shaft; substantially as described.

9. The combination with a shaft adapted to be alternately rotated in both directions, of a slidable door, a spool upon said shaft, ribbons connected to opposite sides of the door, and adapted to be wound upon the spool and suitable means for rotatably connecting the spool with the shaft at will; substantially as described.

10. The combination with a shaft adapted to be rotated in both directions and a slidable door, of a spool, loose upon said shaft, connecting device between the door and spool a clutch fast upon the shaft, and suitable device for throwing said clutch into working engagement with the spool; substantially as described.

11. The combination with a shaft extending vertically in the elevator-well, and a slidable door, of suitable device upon the shaft operated thereby to open the door when rotated in one direction and to close the same when rotated in the opposite direction, of means for throwing said device into working engagement with the shaft and for simultaneously starting the rotation; substantially as described.

12. The combination with a normally stationary shaft, and a slidable door, of a spool loose upon said shaft, a flexible connection between said spool and one side of the door, a clutch upon the shaft, device for rotating said shaft and a lever adapted to be actuated to throw said clutch into engagement with the spool and simultaneously start the shaft-operating device; substantially as described.

13. The combination with a shaft and a slidable door, of a spool loose upon the shaft, flexible connection between said spool and the side of the door, whereby the rotation of the spool in one direction opens the door, and in the other closes the same, a clutch upon said shaft, mechanism for rotating said shaft in either direction, a lever for throwing said clutch into engagement with the spool and simultaneously starting the shaft-operating mechanism in the direction to open the door, device whereby the release of said lever starts the shaft-operating mechanism in the other direction, and device for keeping said clutch in engagement with the spool when said lever has been released and until the door is fully closed; substantially as described.

14. The combination with the shaft and a slidable door, of a spool loose upon said shaft, a flexible connection between said door, and the spool adapted to be wound thereupon in the closing of the door, mechanism for rotating the shaft, a lever for throwing said spool into engagement with the shaft, a dog for holding it in engagement therewith after the release of the lever until the door comes to a closed position, means for rotating the shaft and connections between said lever and the shaft-rotating mechanism, whereby the release of the lever starts said mechanism to close the door; substantially as described.

15. A rotatable shaft, a slidable door, a spool loose upon the shaft, a ribbon connecting the door with the spool, and adapted to be wound thereupon in the opening of the door, and a clutch upon the shaft adapted to rotatably connect the shaft with the spool; substantially as described.

16. A rotatable shaft, a slidable door, a spool loose upon said shaft adapted by its rotation to open and close said door, a clutch for throwing said shaft into engagement with the spool and device for locking the door to the clutch when in a closed position, said device being unlocked by the throwing of the clutch into engagement with the spool; substantially as described.

17. In a door opening and closing mechanism, the combination with a suitably-supported slidable door, of a rotatable shaft journaled adjacent thereto, suitable driving mechanism, connections between the shaft and the driving mechanism, adapted, when thrown into engagement, to rotate the shaft, connections between the shaft and the door adapted to move the door by the rotation of the shaft when engaged with the latter, and means for simultaneously throwing the shaft-rotating connections into action and the door-moving connections into engagement with the shaft; substantially as described.

18. The combination with a suitable support, and a slidable door mounted thereon, of a rotatable shaft journaled adjacent to the door, connections between the shaft and the door normally out of engagement with the shaft, but adapted when in engagement therewith to move the door by the rotation of the shaft, suitable driving-gear, connections between the driving-gear and the shaft, normally out of action, but adapted, when

thrown into action, to rotate said shaft, and means for simultaneously throwing said shaft-rotating connections into action and said door-moving connections into engagement with the shaft; substantially as described.

699,808. SAFETY APPLIANCE FOR USE IN CLEANING WINDOWS. HENRY GOLDENFARB, London, England. Filed June 17, 1901. Serial No. 64,917. (No model.)

Claim.—1. In an appliance of the character described, the combination with a bar, a clamping-screw on one end of said bar, of a second bar having a clamping-screw on one end and adapted to slide on the first bar, a guide-clip on each bar through which the other bar is adapted to slide, and means for locking said bars together, substantially as described.

2. In an appliance of the character described, the combination with a bar, a clamping-screw on one end of said bar, of a second bar having a clamping-screw on one end and adapted to slide on the first bar, a guide-clip on each bar through which the other bar is adapted to slide, means for locking said bars together, a rope attached to one of said bars, a belt, and means for attaching said belt to said rope, substantially as described.

3. In an appliance of the character described, the combination with a bar, a clamping-screw on one end of said bar, of a second bar having a clamping-screw on one end and adapted to slide on the first bar, a guide-clip on each bar through which the other bar is adapted to slide, a pulley on one of said clips, a rope attached to the other clip and passing over said pulley for sliding one bar on the other, and means for locking said bars together, substantially as described.

4. In an appliance of the character described, the combination with a bar, a clamping-screw on one end of said bar, of a second bar having a clamping-screw on one end and adapted to slide on the first bar, a guide-clip on each bar through which the other bar is adapted to slide, a pulley on one of said clips, a rope attached to the other clip and passing over said pulley for sliding one bar on the other, means for locking said bars together, a belt, and means for attaching said belt to said bars, substantially as described.

699,807. APPARATUS FOR APPLYING FILLERS TO FLOORS. WILLIAM E. CRISTIN, Newark, N. Y. Filed Aug. 23, 1901. Serial No. 74,006. (No model.)

Claim.—1. A device for applying fillers to floors, comprising a hollow bottomless cone or body for receiving the filling material, a transverse movable rub-board in the body, and means to operate the rub-board and to propel the device by hand, substantially as shown and described.

2. A device for applying fillers to floors, comprising a hollow bottomless body for receiving the filling material to move upon the floor, a transverse pivoted rub-board in the body, inclined to the floor, and a propelling-handle secured to the rub-board, substantially as and for the purpose set forth.

3. A device for applying fillers to floors, comprising a hollow bottomless body for receiving the filling material, a transverse inclined rub-board resting in bearings in the body and formed with horizontal corrugations, and an operating-handle secured to the rub-board to turn it upon its bearings, and to propel the device, substantially as shown and described.

4. A device for applying fillers to floors, comprising a hollow bottomless body for receiving the filling material, a transverse partition dividing the space in the body into forward and rear apartments, a rub-board and a cleaner in the forward apartment, and a cleaner in the rear apartment, with means to operate the device, substantially as shown and described.

5. A device for applying fillers to floors, having a hollow bottomless body for receiving the filling material, a partition dividing the space in the body, a rub-board adapted to turn upon an axis in the body, an operating-handle secured to the rub-board, the partition having a curved part adjacent to the lower edge of the rub-board and concentric with the axis of the rub-board, and cleaners in the body, substantially as shown and described.

699,808. LEAD-PRESS. ROBERT F. HALL, East Orange, N. J., assignor to Western Electric Company, Chicago, Ill., a Corporation of Illinois. Filed Feb. 14, 1901. Serial No. 47,367. (No model.)

Claim.—1. In a lead-press, the combination with a die-block having a forming-chamber hollowed in the interior thereof, and a die and core-tube meeting in alignment in said chamber to form a die-opening, a single unobstructed passage *g* being provided in the die-block through which lead may be forced into the said chamber, said passage opening directly upon the body portion of the core at the rear of the die-opening, a raised supporting-tongue *A* extending along the wall of the forming-chamber at a point directly opposite the opening of said passage, said core-tube resting upon and being contained by said tongue at each point against the pressure of the lead entering the forming-chamber through said passage, means for forcing plastic lead into the forming-chamber through said passage, gas-burners arranged to direct their flames upon the die-block, and adjustable mountings for said burners, whereby the application of the heat to the lead in the forming-chamber may be varied to compensate for variations in pressure at different parts of said chamber.

2. In a lead-press, the combination with a die-block having a forming-chamber therein and a die and core-tube meeting in alignment therein to form a die-opening, a single unobstructed passage *g* being provided in the die-block, opening directly upon the body portion of the core-tube at the rear of the die-opening, means for forcing plastic lead through said passage into the forming-chamber and so through the die-opening, and a raised supporting-tongue *A* extending along the wall of the forming-chamber opposite the mouth of said passage *g*, the core-tube resting upon and being contained by said tongue.

699,809. CARBURTING DEVICE FOR INTERNAL-COMBUSTION MOTORS. CHARLES A. HAMILTON, Coventry, England. Filed Mar. 11, 1901. Serial No. 50,736. (No model.)

Claim.—1. In a carburting device for internal-combustion motors, the combination of a vessel, a liquid-supply pipe to said vessel, a needle-valve to said supply-pipe, a float, a lever connection between said float and the needle of the said valve, a tube carried by said float, an extension of said needle adapted to work in each tube, a passage between said tube and said extension of the needle, and a needle carried by the said tube, substantially as set forth.

2. In a carburting device for internal-combustion motors, the combination of a float exposed to the action of the piston, a needle carried by said float, an open-ended socket and a plunger connected to the said float and needle and free to slide in the said socket, substantially as and for the purpose set forth.

3. In a carburting device for internal-combustion motors, the combination of a vessel, a liquid-supply pipe to said vessel, a needle-valve to said supply-pipe, a cup adapted to float in said liquid, a lever connection between the said cup and the needle of the said valve, a tube carried by said cup, a needle carried by said tube, an extension of said needle adapted to work in said tube, a passage between said tube and said extension of the needle, a cover to the vessel, air-apertures in the said cover, a mixture-chamber, a sleeve communicating with said mixture-chamber and surrounding said tube and said needle, perforations in said mixture-chamber, and a perforated cap rotatable on the perforated part of said mixture-chamber, substantially as and for the purpose set forth.

4. In a carburting device for internal-combustion motors, the combination of a vessel, a liquid-supply pipe to said vessel, a needle-valve to said supply-pipe, a cup adapted to float in said liquid and exposed to the action of the piston, a lever connection between the said cup and the needle of the said valve, a tube carried by said cup, a needle carried by said tube, an extension of said needle adapted to work in said tube, a passage between said tube and said extension of the needle, a cover to the vessel, air-apertures in the said cover, a mixture-chamber, a sleeve communicating with said mixture-chamber and surrounding said tube and said needle, perforations in said mixture-chamber, a perforated cap rotatable on the perforated part of said mixture-chamber, an open-ended socket, and a plunger connected to the said cup and needle and free to slide in the said socket, substantially as and for the purpose set forth.

699,810. LATHE-TURRET STOP. ROBERT M. W. HAMM, Hartford, Conn., assignor to The Pratt & Whitney Company, Hartford, Conn. Filed Dec. 18, 1901. Serial No. 56,370. (No model.)

Claim.—1. In a turret-lathe, the combination, substantially as set forth, with a lathe-bed, a turret-slide, a turret, and releasable power mechanism for feeding the turret-slide along the bed, of a series of stop-rods supported by the bed, a finger carried by the turret-slide and movable into the line of any selected stop-rod, a support for said finger mounted for longitudinal movement on the turret-slide, a rigid stop to limit the extent of said support upon the turret-slide, a latch serving to lock said power mechanism into action, and connections between said support and latch whereby the retreating movement of said support toward said rigid stop serves to disengage said latch before the support reaches the rigid stop.

2. In a turret-lathe, the combination, substantially as set forth, with a lathe-bed, a turret-slide, a turret, and releasable power mechanism for feeding the turret-slide along the bed, of a series of independently-adjustable stop-rods supported by the bed, a finger carried by the turret-slide and movable into the line of any selected stop-rod, a support for said finger mounted for longitudinal movement on the turret-slide, a rigid stop

to limit the retreat of said support upon the turret-slide, a latch serving to lock said power mechanism into action, and connections between said support and latch whereby the retracting movement of said support toward said rigid stop serves to disengage said latch before the support reaches the rigid stop.

3. In a turret-lathe, the combination, substantially as set forth, with a lathe-bed, a turret-slide, a turret, and releasable power mechanism for feeding the turret-slide along the bed, of a bracket supported by the bed, a series of stop-rods supported by the bracket, a finger carried by the turret-slide and movable into the line of any selected stop-rod, a support for said finger mounted for longitudinal movement on the turret-slide, a rigid stop to limit the retreat of said support upon the turret-slide, a latch serving to lock said power mechanism into action, and connections between said support and latch whereby the retracting movement of said support toward said rigid stop serves to disengage said latch before the support reaches the rigid stop.

4. In a turret-lathe, the combination, substantially as set forth, with a lathe-bed, a turret-slide, a turret, and releasable power mechanism for feeding the turret-slide along the bed, of a bracket supported by the bed and longitudinally adjustable along the same, a series of stop-rods supported by the bracket, a finger carried by the turret-slide and movable into the line of any selected stop-rod, a support for said finger mounted for longitudinal movement on the turret-slide, a rigid stop to limit the retreat of said support upon the turret-slide, a latch serving to lock said power mechanism into action, and connections between said support and latch whereby the retracting movement of said support toward said rigid stop serves to disengage said latch before the support reaches the rigid stop.

5. In a turret-lathe, the combination, substantially as set forth, with a lathe-bed, a turret-slide, a turret, and releasable power mechanism for feeding the turret-slide along the bed, of a bracket carried by the bed and longitudinally adjustable along the same, a series of stop-rods supported by the bracket and longitudinally adjustable therein, a finger carried by the turret-slide and movable into the line of any selected stop-rod, a support for said finger mounted for longitudinal movement on the turret-slide, a rigid stop to limit the retreat of said support upon the turret-slide, a latch serving to lock said power mechanism into action, and connections between said support and latch whereby the retracting movement of said support toward said rigid stop serves to disengage said latch before the support reaches the rigid stop.

6. In a turret-lathe, the combination, substantially as set forth, of a lathe-bed, a turret-slide, a turret, means for advancing the turret toward the head end of the bed, a series of stop-rods supported by the bed between its ends and independent of the turret and presenting their ends in the direction of the tail end of the bed and held rigidly to resist endwise motion when their tail ends are pushed upon, and a finger pivoted to the turret-slide and adapted to be swung into the line of any selected stop-rod and engage and be arrested by the tailward presenting end thereof.

7. In a turret-lathe, the combination, substantially as set forth, of a lathe-bed, a turret-slide, a turret, means for advancing the turret toward the head end of the bed, a series of longitudinally-adjustable stop-rods

supported by the bed between its ends and independent of the turret and presenting their ends in the direction of the tail end of the bed and held rigidly to resist endwise motion when their tail ends are pushed upon, and a finger pivoted to the turret-slide and adapted to be swung into the line of any selected stop-rod and engage and be arrested by the tailward presenting end thereof.

8. In a turret-lathe, the combination, substantially as set forth, of a bed, a turret-slide, a turret, disengageable power mechanism for feeding the turret-slide along the bed, a latch carried by the turret-slide and adapted to lock the power mechanism into action, a series of stop-rods fixedly supported by the bed, a transversely-movable finger carried by the turret-slide and adapted to be moved into the line of any selected stop-rod and mounted to have a motion of retreat upon the turret-slide, a stop carried by the turret-slide and adapted to serve in limiting the retracting motion of the finger, and connections between said finger and latch to cause the retracting motion of the finger to release the latch.

9. In a turret-lathe, the combination, substantially as set forth, of a bed, a turret-slide, a turret, disengageable power mechanism for feeding the turret-slide along the bed, a latch carried by the turret-slide and adapted to lock the power mechanism into action, a series of stop-rods fixedly supported by the bed, a finger carried by the turret-slide and mounted for longitudinal movement thereon and constructed to be moved into the line of any selected stop-rod and adapted to serve in limiting the retracting motion of the finger, connections between said finger and latch to cause the retracting motion of the finger to release the latch, and mechanism connecting the turret and the finger to cause the finger to move into line with the several stop-rods in accordance with the angular motion of the turret.

10. In a turret-lathe, the combination, substantially as set forth, with a lathe-bed, a turret-slide, a turret, and releasable power mechanism for feeding the turret-slide along the bed, of a series of stop-rods fixedly supported by the bed, a finger carried by the turret-slide and movable into the line of any selected stop-rod and capable also of a retracting movement upon the turret-slide, mechanism connecting the turret and finger to move the finger into line with the several stop-rods in correspondence with the angular motion of the turret, a latch-rod mounted in the turret and serving to engage and disengage the power mechanism, a latch carried by the turret-slide and engaging the latch-rod and holding it in position corresponding with the engaged position of the power mechanism, and connections between the latch and the finger to cause the latch to be released by the retracting motion of the finger.

11. In a turret-lathe, the combination, substantially as set forth, of a lathe-bed, a turret-slide, a turret, releasable power mechanism for feeding the turret-slide along the bed, a series of stop-rods fixedly supported by the bed, a block mounted to slide horizontally on the turret-slide, a stop carried by the turret-slide to limit the rearward sliding of the block, a latch carried by the block and adapted to serve in retaining the power mechanism in action, a finger mounted on the block and adapted to move into line of any selected stop-rod, and mechanism connecting the turret and the finger to cause the finger to move into the line of the several stop-rods in correspondence with the angular movement of the turret.

699,811. SHEET-METAL PARTING-CLEAT. FREDERICK E. HERR, Louisville, Ky., assignor of two-thirds to CURTIS POPE and ALFRED THURMAN POPE, Louisville, Ky. Filed Aug. 23, 1901. Serial No. 73,002. (No model.)

Claim.—A cleat composed of a rectangular plate of metal bent on a line parallel to its edge to form two flanges, one flange being plane, the other flange having points struck from its body with their faces in the plane of the plane flange but projecting in opposite direction, and having also points struck from its edge with their bases perpendicular to the plane flange, and extending in reverse direction from the plane flange.

699,812. MOP-HEAD. AUGUST S. HELM, Prospect, Ill., assignor to Stover Manufacturing Company, Prospect, Ill., a Corporation of Illinois. Filed Oct. 30, 1902. Serial No. 80,570. (No model.)

Claim.—1. In a mop-head, in combination, a handle, a casing comprising a fixed clamping-jaw and a handle-socket, a counterpart movable clamping-jaw—parallel with the fixed jaw—having its ends extending and converging rearwardly and united by connecting means, a lever fulcrumed, by one end, to the handle, and extending therefrom rearwardly through the connecting means of the clamping-jaw ends, and a spring interposed between said connecting means and a bearing at the lower end and portion of the lever, substantially as and for the purpose specified.

2. The combination of a handle A, with a fixed clamping-jaw B fast thereto, a movable clamping-jaw C having its ends C' C'' extending and converging rearwardly, means, as a collar D, for uniting the ends C' C'' of the jaw C, a lever E fulcrumed, by one end, to the handle A, and extending therefrom through the collar D, and a spring F normally acting to clamp the jaw C against the jaw B, substantially as and for the purpose specified.

699,813. MOP-HEAD. AUGUST S. HELM, Prospect, Ill., assignor to Stover Manufacturing Company, Prospect, Ill., a Corporation of Illinois. Filed Jan. 4, 1903. Serial No. 82,422. (No model.)

Claim.—In a mop-head, in combination, a handle, a casing comprising a fixed clamping-jaw; a transversely-slotted spring-chamber; and a handle-socket, a fulcrum, extending through, and adapted to slide in and longitudinally of, the transverse slot in the spring-chamber, a spring, inclined in each chamber and normally acting to force the fulcrum from the fixed jaw, a bifurcated lever, connected, by its fulcrum, with the ends of the fulcrum, a counterpart movable clamping-jaw, parallel with the fixed jaw, having its ends extending and converging rearwardly and pivotally connected with the lever, at its mid-portion, substantially as and for the purpose specified.

699,814. MOP-HEAD. AUGUST S. HELM, Prospect, Ill., assignor to Stover Manufacturing Company, Prospect, Ill., a Corporation of Illinois. Filed Jan. 4, 1903. Serial No. 82,423. (No model.)

Claim.—In a mop-head, in combination, a stick having a transverse slot extending therethrough, a casing comprising a fixed clamping-jaw and a handle-socket, a fulcrum, extending through, and adapted to slide in and longitudinally of, the transverse slot in the stick, a coiled spring—encircling the stick—compressible between the socket on the fixed jaw and the slidable fulcrum, and normally acting to force each fulcrum from the fixed jaw, a bifurcated lever, connected, by its fulcrum, with the ends of the fulcrum, a movable clamping-jaw—parallel with the fixed jaw—having its ends extending and converging rearwardly and pivotally connected with the lever at its mid-portion, substantially as and for the purpose specified.

699,815. MOP-HEAD. AUGUST S. HELM, Prospect, Ill., assignor to Stover Manufacturing Company, Prospect, Ill., a Corporation of Illinois. Filed Jan. 4, 1903. Serial No. 82,427. (No model.)

Claim.—In a mop-head, in combination, a stick, a casing comprising an upper clamping-jaw and a transverse socket adapted to admit

and freely slide on the lower end and portion of the stick, a fulcrum extending through and fixed in the stick, a bifurcated lever, connected by its fulcrum, with the ends of the fulcrum, a counterpart lower clamping-jaw—parallel with the upper jaw—having its ends extending and converging rearwardly and pivotally connected with the mid-portion of the lever, and means for slidably connecting the socket of the upper jaw with the stick, substantially as and for the purpose specified.

699,816. MACHINE FOR FINISHING BOTTOMS OF TROUSERS. WILLIAM HERR, Stevens, Ill. Filed Sept. 14, 1901. Serial No. 73,037. (No model.)

Claim.—1. In a machine of the class set forth, an ironing-roll, means for heating the same, a pressing-roll, means for moving the same toward and from the ironing-roll, a hemming attachment, and means for feeding an adhesive strip into said hem.

2. In a machine of the class set forth, an ironing-roll, means for heating the same, a pressing-roll, a hemming attachment, and means for moving said hemming attachment into and out of operable relation to the rolls.

3. In a machine of the class set forth, an ironing-roll, means for heating the same, a pressing-roll having a covering of yielding material, means for moving the pressing-roll toward and from the ironing-roll, a hemming attachment movable into and out of operable relation to the rolls, and means for guiding and feeding an adhesive strip into said hem.

4. In a machine of the class set forth, ironing and pressing rolls, a movable hemming attachment, an adhesive-strip-feeding means, and a covering device for the adhesive strip.

5. A machine of the class set forth, comprising ironing and pressing rolls, a hemming attachment movable into line with the said rolls and having a groove therein, and an adhesive-strip guiding and feeding means.

6. The combination with pressing and heating devices, a hemming attachment, means for feeding an adhesive strip to said hemming attachment, and a movable rest for covering a portion of the said means to protect the strip passing therethrough.

7. A machine of the class set forth, comprising heating and pressing devices, the pressing device being adjustable in relation to the heating device, and an adjustable and movable hemming attachment.

8. In a machine of the class set forth, ironing and pressing devices, a hemming attachment, an adhesive-strip-feeding means, and covering means for said strip located between the feeding means and the hemming attachment.

9. A machine of the class set forth, comprising pressing and heating devices, a feed-guide for an adhesive strip having a rearwardly-directed terminal, and means for severing the said strip located between the said terminal and the heating and pressing devices.

10. A machine of the class set forth, comprising vertically-disposed ironing and pressing rolls, a pivotally-mounted hemming attachment, and means for effecting the adjustment of the hemming attachment as a whole longitudinally of the rolls, whereby the attachment may be held in operable relation to said rolls, or may be moved beyond the ends of the rolls, substantially as specified.

11. A machine of the class set forth, comprising heating and pressing devices, an elevatable and depreciable hemming attachment, means for feeding an adhesive strip, and covering device for the adhesive strip located in advance of the said hemming attachment.

12. A machine of the class set forth, comprising heating and pressing devices, a hemming attachment, means for feeding an adhesive strip, and a movable rest having a finger projecting therefrom, the said rest and finger forming guard means for the adhesive strip.

699,817. **BUCKLE-SHIELD.** GEORGE L. HENRY, Erie, Ohio. Filed Jan. 20, 1902. Serial No. 90,442. (No model.)

Claim.—The combination with a buckle having a pivoted tongue, of a shield angular in length and provided with downwardly-projecting angular side flanges which are pivoted intermediate their ends to the sides of the buckle-frame at its front end and are adapted to guide the strap between the sides of the buckle-frame into position to be engaged with the tongue, substantially as set forth.

699,818. **HORN HAY-RAKE.** GEORGE F. HENDON, Rockford, Ill., assignor to Emerson Manufacturing Company, Rockford, Ill. Filed Sept. 3, 1901. Serial No. 74,188. (No model.)

Claim.—1. In a horse hay-rake, the combination of an axle, a rake-head, a tongue-supporting frame, a double link connection between the rake-head and tongue-supporting frame, a foot-lever, a loop receiving the double link connection, a connection between the foot-lever and loop, and a stop for the loop.

2. In a horse hay-rake, the combination of an axle, a rake-head, a tongue-supporting frame, a double link connection between the rake-head and tongue-supporting frame, a foot-lever, a loop receiving the double link connection, a connection between the foot-lever and loop, a stop for the loop, a pivoted bail and a spring connection between the bail and foot-lever.

699,819. **KE-TRAY.** THOMAS W. HENNING, Los Angeles, Tex. Filed Sept. 4, 1901. Serial No. 74,221. (No model.)

Claim.—The herein-described combined ice-holder and water-cooler consisting essentially of the bottom wall, the wall of cold-conducting ma-

terial disposed in a plane above the bottom wall, the capacious side wall O extending upwardly from the bottom wall to a point above the cold-conducting wall, and permanently joined in a water-tight manner at their lower ends to the bottom wall, and at an intermediate point of their height to the cold-conducting wall; said side wall O serving in conjunction with the bottom and cold-conducting walls to form a water-chamber, and in conjunction with the cold-conducting wall to form an ice-receptacle above the water-chamber, and having inlet and outlet ports communicating with the water-chamber at opposite points, and the plurality of partitions arranged in the water-chamber at intervals between the inlet and outlet ports, and extending from side to side and top to bottom of the chamber; the said partitions each having a small opening near its upper edge whereby the water must of necessity pass several times in a slight stream adjacent to the cold-conducting wall incident to its passage through the water-chamber, and the opening in one partition being arranged adjacent to the opposite side of the chamber with reference to the opening in the next adjacent partition to compel the water to take a tortuous course and retard its passage through the chamber.

699,820. **ADDING-MACHINE.** DE KROMER & T. HENRY, St. Louis, Mo., assignor to the New Best Machine Manufacturing Company, St. Louis, Mo., a Corporation of Missouri. Filed Nov. 21, 1902. Serial No. 37,308. (No model.)

Claim.—1. The combination of a column of keys, a separate sliding stop-bar connected to each key, each stop-bar when operated dropping below the level of the other stop-bars, an adding device, a printing device, a carriage positively connected to the printing device, the movement of said carriage being limited by the said stop-bars when in operation; substantially as described.

2. An adding-machine as described comprising a system of geared accumulating devices, independently-operated toothed racks for turning said accumulating devices in one direction when adding, total-racks for turning said accumulating devices in an opposite direction, a system of stops to limit the travel or movement of said independently-operated racks when in engagement with said accumulating devices, other stops to limit travel or movement of said total-racks when in engagement with said accumulating devices, means for operating said independently-operated racks, and said total-racks so that each shall move from the same point at the same time, and a printing device cooperatively connected therewith.

3. In combination two or more sets of independent keys loosely mounted to operate sliding stop-bars in one direction, a transversely-mounted bar for holding said stop-bars in a retracted and lowered position, an independently-mounted stop-bar for printing 0's when and where desired operatively connected therewith, independent error-keys for each column of keys to restore any lowered stop-bar independently, and automatic restoring device transversely disposed to operate said stop-bars conjointly; substantially as described.

4. The combination of a series of columns of independent keys, of graded stop-bars slidingly connected therewith, an 0 stop-bar for each column of keys, means for automatically operating said 0 stop-bars conjointly with other like stop-bars when it is desired to print 0's to the right of a figure, means for holding all of said stop-bars in an elevated position, means for retaining said stop-bars within the path of other moving parts of the machine, automatic means for restoring said stop-bars to a position out of the path of travel of other parts of the machine; substantially as described.

5. The combination in a machine of the kind described, of sliding stop-bars of graded length operatively held above the line of travel of the accumulator stop devices, keys for operating said sliding stop-bars independently, a transverse bar for holding said stop-bars out of engagement, notches formed in one edge of said stop-bars for engaging said transverse bar when it is desired to operate the machine for adding, recording device connected to the accumulator-actuating device, said actuating device arranged to shut against said limiting device when engaging said transverse retaining-bar; substantially as described.

6. A column of independent keys loosely connected to and operating stop-bars, a series of retracting sliding stop-bars of graded lengths, which in operation drop below the level of other stop-bars thereby limiting the movement of the adding and recording devices conjointly; substantially as described.

7. The combination of a series of columns of independent keys, of graded stop-bars connected therewith, and an 0 stop-bar for each column of keys, means for automatically bringing the 0 stop-bar into engagement in all columns where it is desired to print an "0" conjointly with the stop-bar operated by the key; substantially as described.

8. The combination of the keyboard and sliding stop-bars which in operation drop below the level of the other stop-bars for limiting the movements of the adding mechanism, of a printing device and an adding device having a positive mechanical connection between them; substantially as described.

9. In an adding-machine the combination of stop-bars connected to the keys and the 0 stop-bar without a corresponding key, of means for operating the 0 stop-bar by both the key-operated stop-bars and the 0 stop-bar in the column above; substantially as described.

10. The combination of a series of columns of numbered keys, each key connected to an independent stop-bar of length to correspond to the number on the connected key, an 0 stop-bar without connected key arranged to be automatically operated by the operation of either the key stop-bars or the 0 stop-bar in the column to the left, substantially as described.

11. The combination of a series of columns of numbered keys, each key operating an independent stop-bar, of length to correspond to the number on the key, and a separate error-key for disengaging the stop-bars under each column of keys, substantially as described.

12. The combination in an adding and recording machine, of columns of keys connected to operate sliding stop-bars, pinion-wheels engaging the accumulator-wheels, operative connections between said stop-bars and pinion-wheels and means for retaining said pinion-wheels in one direction when adding and in the reverse direction when taking the total; substantially as described.

13. The combination in an adding and recording machine a keyboard having columns of independent keys, stop-bars connected to said keys, pinion-wheels for operating the accumulating device, operative connections between said stop-bars and pinion-wheels and racks above and below said pinion-wheels, which are alternately brought into engagement with said pinion-wheels when adding and taking the total, substantially as described.

14. The combination of a keyboard having columns of independent keys operating sliding stop-bars, pinion-wheels for operating the accumulating device, racks for rotating said pinion-wheels, operative connections between the stop-bars and the pinions and the type-casters for printing the amounts added and the totals, the said racks and type-casters being both positively connected to the same operative mechanism, substantially as described.

15. In an adding and recording machine, type-casters bearing type numbered from one to nine and having an 0 after the nine, and an independent 0 before the one so arranged that when any type-caster is brought into operation it moves all the independent 0's in the higher columns out of the printing-line, substantially as described.

16. An adding-machine of the kind described consisting of two or more intermeshing sets of keys having stems, each key arranged to operate a bent lever in but one direction, bent levers pivoted with one arm within the path of one of said keys, and the other arm operatively connected to a stop-bar, stop-bars of graded length, means for holding the graded ends of said stop-bars in an elevated position, means for holding graded ends of said stop-bars in a lowered position, means for restoring all depressed stop-bars to an elevated position simultaneously, means for

restoring any one of said stop-bars independently, stop-bars for limiting the travel of other parts of the machine when it is desired to print 0's automatically, overlapping pendulums in connection with said stop-bars, operative connections between the keys and said overlapping pendulums, 0 printing-type connected to print "0's" automatically in connection therewith, substantially as described.

17. An adding-machine of the kind described consisting of two or more sets of keys, each arranged to operate a bent lever in but one direction, bent levers for each of said keys, said bent levers pivoted with one free arm within the path of each one of above keys and connected to stop-bars of graded length, stop-bars graded as to length with respect to point of connection with above said keys, means for holding the graded ends of said stop-bars in an elevated position, means for holding graded ends of said stop-bars when in a lowered position, means for restoring said stop-bars to an elevated position simultaneously, means for restoring any one of said stop-bars independently, a stop-bar for limiting the travel of other parts of the machine when it is desired to print 0's automatically, means for operating said stop-bars conjointly with other like stop-bars, substantially as described.

18. An adding-machine of the kind described consisting of a keyboard, key-operated stop-bars, accumulating devices, independently-mounted racks for turning said accumulating devices in one direction, racks for turning said accumulating devices in an opposite direction, means for transferring motion from one accumulating device to another like device consecutively, type-bearing printing-casters operated by handle or other motive power so that said type-bearing casters shall move uniformly with said handle or other motive power when no key has been operated; means for limiting the movement of said type-bearing casters independent of the stop-bars, means for limiting said type-bearing casters for printing 0's when and where desired, means for printing 0's independently of said type-bearing casters when the total-key is operated for printing a total, substantially as described.

19. An adding-machine of the kind described consisting of detachable keys, loosely-mounted bent connecting-levers within the path of said keys, stop-bars connected to said bent connecting-levers, means for holding one end of said stop-bars in a forward elevated position, means for holding one end of said stop-bars when in a lowered position, a lever for elevating said stop-bars simultaneously, keys for elevating said stop-bars independently, sliding devices mounted to stop against or pass beneath said stop-bars at the will of the operator, connection between said sliding devices and the racks for operating the accumulators, and printing or recording devices.

20. In an adding-machine the combination of sliding stop-bars and the engaging and overlapping pendulums, for operating the 0 stop-bar in the column below; substantially as described.

21. In an adding-machine the combination of a sliding carriage, a rack connected thereto, a pinion for rotating the accumulator-wheel, means for bringing said rack into engagement with said pinion as a forward movement of the carriage in columns where keys have been depressed, and means for automatically disengaging said rack on the return movement of the carriage; substantially as described.

22. In an adding-machine the sliding carriage, a special rack connected thereto for taking the total, a pinion for operating the accumulating device, and means for engaging said rack with the pinion for rotating the accumulator-wheel so that when the carriage moves forward the rack will reverse the accumulator-wheel and means for disengaging the rack or leaving it in engagement with the pinion at the end of the forward stroke of the handle at the will of the operator; substantially as described.

23. In an adding-machine a series of accumulator-wheels, pins secured to said wheels and operated by a distance of ten teeth, wings for carrying hooks within the path of said pins, and a shearing-bar for restoring said wings whenever the hooks have been disengaged, pins connected to said wings and engaging the next accumulator-wheel above, and means for rotating said accumulator-wheel above one tooth after said pin engages said hook; substantially as described.

24. The combination in an adding-machine of a series of accumulator-wheels and a carrying device having a pawl engaging the accumulator-wheel above, which is released by pins secured to said accumulator-wheels, a shearing-bar which operates to successively release all of said carrying devices beginning at the lowest column and ending at the highest; substantially as described.

25. In an adding-machine a carrying device consisting of swiveling wings carrying pawls and provided with inclined forward edges, a descending bar acting on the inclined edges successively from the right side in the left side of the machine and holding said wings in an engaged position until all are brought into engagement; substantially as described.

26. In an adding-machine a series of accumulator-wheels a series of bent-pawls arranged to engage all of said accumulator-wheels at the same time and permitting the accumulator-wheels to revolve one tooth while in engagement; substantially as described.

27. The combination with keys connected to independent sliding stop-bars, of pivoted type-carriers connected to sliding carriages, and sliding carriages whose movement is limited by said stop-bars; substantially as described.

28. The combination with a series of type-carriers, of a series of independent stop-bars connected to keys, for each type-carrier and an automatically-operated stop-bar for each type-carrier, means for moving said type-carrier, and means for restoring all of said stop-bars automatically; substantially as described.

29. In an adding-machine the combination of keys, each key connected to an independent sliding stop-bar, a series of accumulator-wheels, means for rotating said accumulator-wheels as many teeth as the number of the key depressed, type-carriers pivoted to swing a distance to correspond to the number on the key depressed and connected to the same moving part that operates the accumulator-wheel; substantially as described.

30. In an adding-machine the combination of keys, each key connected to an independent stop-bar, a series of accumulator-wheels, means for rotating said accumulator-wheels as many teeth as the number of the key depressed, type-carriers pivoted to swing a distance to correspond to the number on the key depressed and connected to the same moving part that operates the accumulator-wheel, and a device for printing 0's in taking totals without raising the type-carriers; substantially as described.

31. In a machine of the kind described the combination of accumulating devices and a printing device, a shuttle arranged to bring the accumulating mechanism into engagement with its operating mechanism before movement is imparted to the printing device on a forward stroke of the handle and arranged to release the accumulating mechanism before the backward movement of the handle begins; substantially as described.

32. In an adding-machine a handle connected to levers which successively bring into engagement racks with accumulator-wheels in the columns where the keys have been depressed rotate said accumulator-wheels and set the printing device, operate the printing device, and release the racks from engagement with the accumulator-wheels on the forward stroke of the handle, and restore the stop-bars and keys to their normal position on the return stroke of the handle; substantially as described.

33. In an adding-machine a printing device for printing a line of irregular number of type, of a series of lines of type and a corresponding series of contact pressure-surfaces, so arranged that the contact pressure-surfaces will be in engagement whenever the type do not print when the machine is operated; substantially as described.

34. A printing device consisting of a series of bars having type fixed thereon, a series of contact-surfaces, rollers for holding the paper and pressing against the type when the same are opposite the printing-line and against the contact-surfaces when the type are not opposite the printing-line, whenever the machine is operated.

699,821. CENTRIFUGAL MACHINE. LEONIE RIEG, Grevenbroich, Germany. Filed Jan. 17, 1902. Serial No. 90,104. (No model.)

Claim.—1. In centrifugal machines to be used in the manufacture of sugar a wedge-shaped partition to be inserted between a top and a bottom flat horizontal ring, within the drum or basket of the machine, said wedge-shaped partition consisting of angular bent sides *b b* with strengthened corner-points, of a curved back side *d* and of triangular pieces *g g* at top and bottom, the two latter being riveted to the sides *b b* and *d*.

2. In centrifugal machines a wedge-shaped partition to be inserted between a top and a bottom flat horizontal ring within the drum or basket of said centrifugal machine consisting of angular bent sides *b b*, of a curved back side *d*, of triangular pieces *g g* at top and bottom, the sides of said triangular pieces and the plates or sides *b b* and back side *d* being provided with corresponding holes, for split rivets to pass into these holes, to expand within the holes by wedges inserted into the split and to receive counter-sunk rivet-heads when said rivets are driven home.

3. In centrifugal machines a wedge-shaped partition, consisting of angular bent sides, a curved back side, top and bottom triangular pieces, said triangular pieces being secured to the plates *b b* and *d* by being riveted together by expanding split rivets with counter-sunk heads, the top and bottom pieces being provided with holes and set-screws to render

possible the proper placing of the wedge-shaped partition between the flat horizontal rings at top and bottom, the upper triangular piece being provided with a bolt and strap-shaped nut.

4. In centrifugal machines a wedge-shaped partition, consisting of angular bent sides, a curved back side, top and bottom triangular pieces all these parts riveted together by expanding split rivets with counter-sunk heads, a bolt traversing the top ring, the upper triangular piece, the wedge-shaped partition, the lower triangular piece and the lower flat horizontal ring, to which said bolt is rigidly connected.

699,822. PACKAGING SHEET-METAL SECTIONS. GEORGE F. ROSS, New Orleans, La., assignor of one-half to THE H. HALLER MANUFACTURING COMPANY, LIMITED, New Orleans, La. Filed Dec. 2, 1901. Serial No. 84,322. (No model.)

Claim.—The herein-described package or bundle comprising a plurality of sheet-metal articles having hook-shaped portions at opposite edges; the said articles being loosely and detachably hooked one on the other to form a continuous sheet of detachably-connected articles, and being rolled into a package or bundle, and means for securing the detachably-connected articles in the form of a package or bundle.

699,828. TOOL-HANDLE. WILLIAM A. HOLLIDAY, Chgo., Ill. Filed Feb. 18, 1902. Serial No. 84,328. (No model.)

Claim.—As an improved article of manufacture, a hollow handle having a tapering end, which is conical-shaped with a threaded aperture through the apex thereof, and a flattened shoulder adjacent to the inner end of the aperture in said apex, combined with a conical-shaped washer, the apex of said washer bearing against said shoulder, with the outer circumference of said washer in contact with the inner tapering wall of the handle, and the head having a threaded shank portion passing through the threaded aperture, in the apex of the handle and the threaded aperture in the enlarged end of said washer, whereby the parts are securely held together, as set forth.

699,824. COTTON-PICKER'S SACK. JOHN H. HOLLEN, Epling, Miss. Filed Aug. 26, 1901. Serial No. 73,345. (No model.)

Claim.—A sack of the class set forth having the upper extremity of that portion adapted to be nearest the wearer extended above the corresponding outer portion to provide a mouth, inclined reinforced straps secured across the corner portions of the upper or mouth extremity of the sack and interiorly located, strips secured against the opposite sides of the lower closely-drawn terminal portion of the sack, doubled corner-strips extending vertically over the opposite terminals of the strips at the bottom of the sack and also over the lower corners of the latter above the plates of said strips, and means for holding the sack in operative position on the body of the wearer, whereby the lower end of the sack may be permitted to drag upon the ground during the operation of cotton-picking with greater wearing durability.

699,824.

699,825. TYPE-WRITING MACHINE. RICHARD ECKHART and WILHELM WERNER, Berlin, Germany. Filed Feb. 27, 1901. Serial No. 84,325. (No model.)

Claim.—1. In a type-writer, a pivoted platen-hammer, a depending abutment fixed to said hammer so as to turn with it, a retaining-bush pivoted to and suspended on said hammer, a plunger passing through said abutment and impinging upon said latch, a shoulder on said plunger and a spring between said shoulder and said abutment, substantially as described.

2. In a type-writer, a pivoted type-carrier, a selecting-arm fixed thereto so as to rotate therewith, depressible key-levers, selecting-plungers for stepping said selecting-arm under the respective key-levers and a spring under each plunger normally supporting both its plunger and the key-lever over it.

699,826. REFINING OF COPPER BY THE WET METHOD. THOMAS A. DYER, Birmm., England, assignor to DONALD McVIE, London, Ontario, England. Filed Dec. 26, 1901. Serial No. 84,326. (No model.)

Claim.—1. A process for the extraction of copper consisting in the treatment of the ore within a mixed solution of chlorid of sodium and sulfuric acid in which solution there is an excess by weight of the chlorid of sodium in respect to the sulfuric acid, substantially as described.

2. A process for the extraction of copper, consisting in the treatment of the ore within a mixed solution of chlorid of sodium and sulfuric acid in the proportion of four ounces chlorid of sodium and one fluid ounce of concentrated sulfuric acid to the gallon.

699,827. SWITCH-OPERATING APPARATUS. CHARLES E. JACKSON, Rockford, Ill. Filed Dec. 12, 1901. Serial No. 84,327. (No model.)

Claim.—1. In a switch-operating apparatus, in combination, a switch-tongue; a pivoted T-shape lever; a rod having a pivotal connection with one arm of said lever and with said switch-tongue; a switch-operating box located between the rails of the track; a switch-operating box aligned with said first-mentioned switch-operating box and located intermediate said box and said switch-tongue; a plate pivotally mounted near one of its sides in each of said boxes; an arm extending downward from the under side of each of said plates; a rod pivotally connected with the arm of one of said pivoted plates and with one of the arms of said T-shape lever; a rod pivotally connected with the arm of the other of said pivoted plates and with the remaining arm of said T-shape lever; and a device carried by the car for moving one of said plates to actuate said T-shape lever to operate said switch-tongue.

2. In a switch-operating apparatus, in combination, a switch-tongue; a pivoted T-shape lever; a rod having a pivotal connection with one arm of said lever and with said switch-tongue; a switch-operating box located between the rails of the track; a switch-operating box aligned with said first-mentioned switch-operating box and located intermediate said box and said switch-tongue; a plate pivotally mounted near one of its sides in each of said boxes; an arm extending downward from the under side of each of said plates; a rod pivotally connected with the arm of one of said pivoted plates and with one of the arms of said T-shape lever; a rod pivotally connected with the arm of the other of said pivoted plates and with the remaining arm of said T-shape lever; a flexible water-tight covering for the upper end of each of said switch-operating boxes; and a device carried by the car for moving one of said plates to actuate said T-shape lever to operate said switch-tongue.

3. In a switch-operating apparatus, in combination, a switch-tongue; a pivoted T-shape lever; a rod having a pivotal connection with one arm of said lever and with said tongue; two aligned switch-operating boxes between the rails of the track, one of said boxes being located intermediate said switch-tongue and the other of said boxes, each of said boxes having bases for securing them to the ties; a tilting plate pivotally mounted near one of its sides within each of said boxes; a rod forming a connection between the arm of one of said tilting plates and one of the arms of said T-shape lever; a rod forming a pivotal connection between the arm of the other of said tilting plates and the remaining arm of said T-shape lever.

lever; a pipe for each of said rods; a pipe for the rod extending between the stem of the T-shape lever and said switch-tongue; a packing in said last-mentioned pipe to prevent the ingress of water to said mechanism; and a device carried by the car for moving said plates to actuate said T-shape lever and to operate said switch-tongue.

4. In a switch-operating apparatus, in combination, a switch-tongue; a pivoted T-shape lever; a rod having a pivotal connection with one arm of said lever and with said tongue; two aligned switch-operating boxes between the rails of the track, one of said boxes being located intermediate said switch-tongue and the other of said boxes, each of said boxes having bases for securing them to the ties; a tilting plate pivotally mounted near one of its sides within each of said boxes; an arm extending downward from the under side of each of said plates; a rod forming a connection between the arm of one of said tilting plates and one of the arms of said T-shape lever; a rod forming a pivotal connection between the arm of the other of said tilting plates and the remaining arm of said T-shape lever; a pipe for each of said rods; a pipe for the rod extending between the stem of the T-shape lever and said switch-tongue; a packing in said last-mentioned pipe to prevent the ingress of water to said mechanism; a pressure-wheel carried by the car, for moving said plates to actuate said T-shape lever and to operate said switch-tongue; means for depressing said pressure-wheel; and means for returning the pressure-wheel to its normal position.

699,838. WEIGHING AND MEASURING MACHINE. ARTHUR P. JOHNSON, Oshkosh, N. J., assignor of one-half to George A. McAllister, Oshkosh, N. J. Filed Aug. 9, 1901. Serial No. 71,484. (No model.)

Claim.—1. In a device for weighing and measuring points, the combination of a hopper having at the bottom a feeding-tube, a valve arranged below the feeding-tube, a feeding-curve arranged in the feeding-tube, an upright shaft for rotating the feeding-curve jointed to the screw within the hopper so as to be capable of being turned at an angle to the screw, a bearing at the upper part of the hopper for holding the upright shaft in position and having means for liberating the shaft therefrom, and power devices for rotating said upright shaft forming a detachable connection with said shaft, whereby the latter may be liberated and drawn to one side for the purpose of removing the feeding-curve.

2. In a device for weighing and measuring points, the combination of a hopper having at the bottom a feeding-tube, a valve arranged below the feeding-tube, a feeding-curve arranged in the feeding-tube, an upright shaft for rotating the feeding-curve jointed to the screw within the hopper so as to be capable of being turned at an angle to the screw, a bearing at the upper part of the hopper for holding the upright shaft in position and having means for liberating the shaft therefrom, and power devices consisting of a horizontal power-shaft carried in fixed bearings, and bevel-gears connecting the said horizontal power-shaft with the upright shaft for rotating said upright shaft and forming a detachable connection with said shaft, whereby the latter may be liberated and drawn to one side for the purpose of removing the feeding-curve.

3. In a device for weighing and measuring points, the combination of a hopper having at the bottom a feeding-tube, a valve arranged below the feeding-tube, a feeding-curve arranged in the feeding-tube, an upright

shaft for rotating the feeding-curve jointed to the screw within the hopper so as to be capable of being turned at an angle to the screw, a bearing at the upper part of the hopper for holding the upright shaft in position and having means for liberating the shaft therefrom, power devices for rotating said upright shaft forming a detachable connection with said shaft whereby the latter may be liberated and drawn to one side for the purpose of removing the feeding-curve, a movable platform for carrying the receptacle to be filled, an adjustable support to permit the platform to rise or fall, automatic means for closing the valve upon the proper depression of the platform, and actuating means between the platform and the automatic means for closing the valve.

4. In a device for weighing and measuring points, the combination of a hopper having at the bottom a feeding-tube, a valve arranged below the feeding-tube, a feeding-curve arranged in the feeding-tube, an upright shaft for rotating the feeding-curve jointed to the screw within the hopper so as to be capable of being turned at an angle to the screw, a bearing at the upper part of the hopper for holding the upright shaft in position and having means for liberating the shaft therefrom, power devices for rotating said upright shaft forming a detachable connection with said shaft whereby the latter may be liberated and drawn to one side for the purpose of removing the feeding-curve, hand-controlled means for opening the valve, a spring to close the valve, a detent or latch carried with the valve-body to hold the valve in its open position, a flexible or yielding connection to operate the detent, and a counterbalanced platform upon which the vessel to be filled is to be placed adapted to move the yielding connection to operate the detent or latch for the purpose of closing the valve upon the depression of said platform under the weight of the filled receptacle or vessel.

5. In a device for weighing and measuring points, the combination of a hopper for receiving material terminating at the bottom in a downwardly-extending feeding-tube having a reduced neck and, a valve in the end of the tube having a small orifice relatively to the area of the feeding-tube, a feeding-curve within the feeding-tube and substantially fitting it for forcing the material through the small valve-orifice, means for operating the feeding-curve, hand devices for opening the valve, an automatic spring device for closing the valve, a latch or detent for holding the valve in open position, and a counterbalanced platform for sustaining a removable vessel to be filled adapted to operate the latch or detent to close the valve under the weight of the material delivered to the receptacle on the platform.

6. In a device for weighing and measuring points, the combination of a hopper for receiving material terminating at the bottom in a feeding-tube, a valve below the tube, a feeding-curve within the feeding-tube, means for operating the feeding-curve, hand devices for opening the valve, automatic mechanical devices for closing the valve, a latch or detent for holding the valve in an open position, a counterbalanced platform for sustaining the vessel to be filled adapted to operate the latch or detent to close the valve under the weight of the material delivered to the receptacle on the platform, a spring surrounding the feeding-tube, a supporting-frame carried by said spring, and a connection between said frame and the platform.

7. In a device for weighing and measuring points, the combination of a hopper for receiving material terminating at the bottom in a feeding-tube, a valve below the tube, a feeding-curve within the feeding-tube, means for operating the feeding-curve, hand devices for opening the valve, automatic mechanical devices for closing the valve, a latch or detent for holding the valve in an open position, a counterbalanced platform for sustaining the vessel to be filled adapted to operate the latch or detent to close the valve under the weight of the material delivered to the receptacle on the platform, a spring surrounding the feeding-tube, a supporting-frame carried by the said spring, and an adjustable connection between said frame and the platform for the purpose of setting same or vessels of different heights.

8. In a device for weighing and measuring points, the combination of a hopper for receiving material terminating at the bottom in a feeding-tube, a valve below the tube, a feeding-curve within the feeding-tube, means for operating the feeding-curve, hand devices for opening the valve, automatic mechanical devices for closing the valve, a latch or detent for holding the valve in an open position, a counterbalanced platform for sustaining the vessel to be filled adapted to operate the latch or detent to close the valve under the weight of the material delivered to the receptacle on the platform, and an adjustable guide on the platform consisting of two arms at an angle at each other adjustable to or from the center of the platform and under the valve between which arms the cans or vessels are placed and centrally guided.

9. In a device for weighing and measuring points, the combination of a hopper terminating at the bottom in a valve-body, and a rotating valve-ping fitted in the body and having its circumferential surface at the bottom substantially on a line with the lower orifice of the valve-body whereby the dripping of the material after the valve is closed is avoided.

10. In a device for weighing and measuring points, the combination of a hopper terminating at the bottom in a valve-body, a rotating valve-ping fitted in the body and having its circumferential surface at the bottom substantially on a line with the lower orifice of the valve-body whereby the dripping of the material after the valve is closed is avoided, hand devices for opening the valve, mechanical devices for closing the valve, a latch or detent for holding the valve open, a movable support for the receptacle to be filled arranged below the valve, and connecting means between the movable support and the latch or detent.

699,839. DOOR-OPERATING MECHANISM FOR ELEVATORS. JAMES L. KELL, Chicago, Ill., assignor to the Winslow Bros. Co., Chicago, Ill., a Corporation of Illinois. Filed Oct. 19, 1901. Serial No. 70,510. (No model.)

Claim.—1. In a door-operating mechanism, the combination with a suitable support, of a slidable door, a bar thereon having a series of laterally-extending pins, a worm parallel with said bar and in engagement with said pins and means for imparting rotation to said worm alternately in opposite directions; substantially as described.

2. The combination with a slidable door and devices for opening and closing the same, of a spring-pressed frictional connection interposed in said devices whereby the tension of the spring tends and limits the pull on the door; substantially as described.

3. In combination, a rotatable shaft, a door, a bar upon said door, a worm-gear in mesh with said bar, a beveled gear frictionally connected with said worm, gears meshing with said beveled gear upon opposite sides of its diameter and each adapted to be thrown into engagement with the shaft; substantially as described.

4. In combination, a rotatable shaft, a door, a bar upon said door, a worm-gear meshing with said bar, a beveled gear held in frictional contact with said worm-gear, gears meshing with said beveled gear upon opposite sides thereof and means for throwing either of said gears into engagement with the shaft; substantially as described.

5. In combination, a rotatable shaft, a door, a worm-gear adapted by its rotation to operate said door, a beveled gear frictionally connected to the worm-gear, gears meshing upon said shaft and meshing with said first-named gear upon opposite sides thereof, a sleeve non-rotatable with respect to the shaft but capable of longitudinal movement thereon, and adapted to connect either of said second-named gears to the shaft; substantially as described.

6. In combination, a rotatable shaft, a door, a bar supported thereon, a worm-gear meshing with said bar, and adapted to be thrown into or out of gear with the rotatable shaft and stops adapted to automatically throw said worm out of gear with the shaft when the door reaches its open or closed position; substantially as described.

7. In combination, a rotatable shaft, a door, a bar supported thereon, a worm-gear, gearing between said worm-gear and the rotatable shaft, a lever for throwing said worm-gear into or out of gear with the shaft,

and stops upon the bar adapted to engage the said lever when the door reaches its open or closed position and automatically throw the worm-gear out of engagement with the shaft; substantially as described.

8. The combination of a door, a rotatable shaft, a supporting-frame, a worm-gear journaled therein, a beveled gear, a shaft carrying said beveled gear and journaled in the worm, a spring adapted to hold the worm-gear and beveled gear in frictional contact, beveled gears loose upon the first-named shaft and meshing with the first-named beveled gear, means for throwing either of said second-named beveled gears into engagement with the shaft, and a device on the door for engagement with the worm; substantially as described.

699,880. TIME-CONTROLLED DAMPER. ROBERT A. ELLIS, JR., Cincinnati, Ohio. Filed Feb. 17, 1902. Serial No. 94,518. (No model.)

Claim.—1. In time setting mechanism a train of gearing, a time-movement, a setting-dial, means for securing the setting-dial to the hour-shaft of the time-movement, a detent for holding the train of gearing in restraint, a bolt adapted to hold the detent in operative position, and an arm extended from the aforementioned dial to effect a release of the detent and permit movement of the train of gearing; substantially as set forth.

2. In time setting mechanism, the combination with a time-movement, a train of gearing, and a detent mechanism for holding the train of gearing in restraint, a dial loosely mounted upon the hour-shaft of the time-movement, and a cam-lever pivoted to said dial and serving to secure it to the shaft in an adjusted position and also adapted to provide a finger-grip or handle to assist in rotation of the dial; substantially as set forth.

3. In combination, a time-movement, a train of gearing, a detent for holding the train of gearing in restraint, a sliding bolt, a rod connected with the detent and having a bent portion overlapping a part of the sliding bolt, a dial provided with an arm for operating the sliding bolt, and means for securing said dial to the hour-shaft of the time-movement; substantially as set forth.

699,881. COMBINED FRESH-WATER SIFON AND TRAP. CHAS. LUTHER, Vicksburg, Miss. Filed Jan. 4, 1902. Serial No. 93,462. (No model.)

Claim.—1. In a device of the character described, the combination with a tank, of a siphon housed therein and having relatively movable concentric legs, one of which is in communication with the interior of the tank, and each of which is secured to a separate wall of said tank.

2. In a device of the character described, the combination with a tank, of a siphon housed therein and having concentric legs communicating with each other at a point above the tank.

3. In a device of the character described, the combination with a tank, of a siphon housed therein and having concentric legs communicating with each other at a point above the tank, one of said legs being extended below the tank and having communication with the interior thereof.

4. In a device of the character described, the combination with a tank, of a siphon having both of its legs mounted for independent automatic movement, to accommodate the movement of the tank-walls.

5. In a device of the character described, the combination with a tank, the walls of which are capable of relative movement, of a siphon having its intake carried by different walls of the tank, and disposed for relative endwise movement to accommodate the movement of said walls.

6. In a device of the character described, the combination with a tank, the walls of which are capable of relative movement, of a siphon having concentric legs secured to opposite walls of the tank and disposed for relative endwise movement to accommodate the movement of said walls.

7. In a device of the character described, the combination with a tank, of a siphon having concentric legs secured to opposite walls of the tank and disposed for relative endwise movement, and a guide movable with each wall and disposed to receive the leg secured to the opposite wall.

8. In a device of the character described, the combination with a tank, of a siphon having concentric legs, and a dome secured to one wall and establishing communication between the legs of the siphon.

9. In a device of the character described, the combination with a tank, of a dome and a trap carried by the opposite walls thereof, and a siphon having concentric legs carried by the dome and trap, respectively.

10. In a device of the character described, the combination with a tank, of a dome and trap carried by the opposite walls thereof and each provided with a guide, and a siphon the legs of which are carried by the dome and trap, respectively, and are slidably received by the guides.

11. In a device of the character described, the combination with a tank, of a dome located above the tank, a trap located below the tank, and a siphon having its legs extended from the dome and trap, respectively, and located one within the other.

12. In a device of the character described, the combination with a tank, of a dome secured to the top wall of the tank and having the ascending leg of a siphon attached thereto, a trap secured to the bottom wall of the tank, a hose-siphon detachably secured to said trap, and the descending leg of a siphon carried by the hose-siphon and extended through the ascending leg and into the dome.

13. In a device of the character described, the combination with a tank, of a trap communicating with the interior of the tank, and a siphon having both its inlet and outlet ends retained by the trap.

14. In a device of the character described, the combination with a tank, of a trap having communication with the interior thereof, and a siphon, one leg of which is supported by the trap, and the other leg of which is retained by the trap against lateral movement but is movable independently thereof in an endwise direction.

15. In a device of the character described, the combination with a tank, of a trap communicating with the interior thereof, a siphon having its intake in communication with the trap, and a strainer located within the trap and disposed to prevent debris from passing to the siphon with the water.

16. In a device of the character described, the combination with a tank, of a trap communicating therewith, a siphon having its intake in communication with the trap, and a removable strainer slidably mounted in the trap to strain the water passing to the siphon.

17. In a device of the character described, the combination with a tank, of a trap secured to the bottom wall thereof and communicating therewith, a siphon having its intake and extended into the trap and having its descending leg extended through the trap, and a pair of removable strainer-plates located within the trap and disposed to prevent debris from passing into the siphon with the water.

18. In a device of the character described, the combination with a tank, of a trap secured to the bottom wall thereof and communicating with its interior, said trap being provided with a partition and with a

pair of removable strainer-plates resting upon the partition, means for drawing off sediment from the bottom of the tank, and a siphon, the ascending leg of the siphon being in communication with that portion of the tank defined between the partition and the strainer-plates, and the descending leg of the siphon being extended through the trap for delivery therebelow.

19. In a device of the character described, the combination with a tank, of a trap, a hose-siphon secured into the bottom of the trap, and a siphon having its intake communicating with the trap and having its descending leg supported by the hose-siphon.

20. In a device of the character described, the combination with a tank, of a siphon having concentric legs, a dome establishing communication between the legs of the siphon, and an air-cock for admitting air to the dome to break the siphon.

21. In a device of the character described, the combination with a tank, of a siphon having independently-movable legs secured to the opposite walls of the tank, whereby relative movement of the walls will be accommodated by corresponding relative movement of the siphon-legs, and means exterior to the tank for breaking the siphon.

699,882. **ACTION-GAS GENERATOR.** DAVID H. LEE, Buffalo, N. Y., assignor to the J. E. Oak Company, a Corporation of New Jersey. Filed Oct. 2, 1900. Serial No. 22,462. (No model.)

Claim.—1. In combination with a carbide-holder and a water-holder of a generator, and a separate and detachable expandible gas-holding chamber provided with connections for controlling the gas generation, a connecting gas-pipe between the generator and the said gas-holding chamber, and a water-cooled drain-pipe leading from the said connecting gas-pipe and provided with a raised mouth through which water may be poured to close the said connecting gas-pipe and cut off the generator from the gas-holding chamber, substantially as set forth.

2. In combination with a carbide-holder and a water-holder of a generator, and a separate and detachable expandible gas-holding chamber provided with connections for controlling the gas generation, a connecting gas-pipe between the generator and the said gas-holding chamber, a water-cooled safety blow-off pipe and a service-pipe leading from the said connecting gas-pipe, and means for introducing water to cut off the service-pipe, substantially as set forth.

3. In combination with a carbide-holder and a water-holder of a generator, and a separate and detachable expandible gas-holding chamber provided with connections for controlling the gas generation, a connecting gas-pipe between the generator and the said gas-holding chamber, and a service-pipe connection from the said connecting gas-pipe and means for introducing water to cut off the said service-pipe, substantially as set forth.

4. In a gas-generating apparatus, the combination with a gasometer distinct from the gas-generating chamber, of a gas connection leading from one to the other, a service-pipe leading from the said gas connection, a drain-pipe for the service-pipe and gas connection, and means for introducing water to seal the service-pipe and gas connection, substantially as set forth.

5. In a gas-generating apparatus, the combination with a gasometer distinct from the gas-generating chamber, of a gas connection leading from

one to the other, a substantially rigid sliding operating connection controlling the generation of gas, actuated by the gasometer, extending through the said gas connection, and guides against which the said operating connection is guided, substantially as set forth.

6. In a gas-generating apparatus, the combination with a gasometer distinct from the gas-generating chamber, of a gas connection leading from one to the other, and combining a cushion exterior to both the generating-chamber and the gasometer, an elbow within the generating-chamber, a gas-pipe secured to said elbow, an elbow and gas-pipe in the gasometer, all detachably coupled to and communicating through the walls of the gasometer and the gas-generating chamber, and an operating connection for controlling the generation of gas, extending through the said elbows and gas connection, substantially as set forth.

699,888. **VESEL FOR THE PRODUCTION OF HIGH-PRESSURE GAS.** ALBERT LEUW, Danburg, Germany. Filed Oct. 2, 1900. Serial No. 21,572. (No model.)

Claim.—1. An electric furnace for gases under high pressure, comprising a vessel having a cover, a fastening-strip including the same, wedges adapted to force the parts together, means to hold the vessel and cover centrally within the strip and to allow self-adjustment so that a uniform pressure is transmitted to all portions of the apparatus, and means for producing an electric arc within said vessel, substantially as described.

2. An electric furnace for gases under high pressure, comprising a metallic vessel having a cover and concave surfaces, a fastening-strip in closing the same, wedges adapted to force the same together, recessed blocks adapted to receive said concave surfaces, and means for producing an electric arc within said vessel, the arrangement being such as to allow of self-adjustment centrally and the transmission of a uniform pressure to all parts of the apparatus, substantially as described.

3. An electric furnace for gases under high pressure, comprising a vessel having a cover, a fastening-strip including the same, wedges adapted to force the cover upon said vessel, graduations upon said wedges whereby the parts may be adjusted to allow gas to escape at a predetermined pressure, means to hold the vessel and cover centrally within the strip and to allow self-adjustment so that a uniform pressure is transmitted to all portions of the apparatus, and means for producing an electric arc within said vessel, substantially as described.

4. An electric furnace for gases under high pressure, comprising a vessel having a cover, a fastening-strip including the same, wedges adapted to force the cover upon said vessel, a refrigerating device for said vessel comprising rings shrunk upon said vessel to produce a predetermined external pressure, means for cooling said rings, and means for producing an electric arc within said vessel, substantially as described.

699,884. **GAS-FASTENER.** JAMES W. LYON, Brooklyn, N. Y. Filed Jan. 25, 1902. Serial No. 21,567. (No model.)

Claim.—1. In a gas-fastener of the character herein set forth, the combination of the two bolts each having an arm or appendage provided with two slots at substantially right angles to each other, the said arms being arranged to move one under the other and being guided and held in place within the shell by a guiding-rod projecting through both, and an interior knob carrying pins projecting through a circular slot in the top of the shell and entering slots in the said arms and arranged to move the arms, substantially in the manner and for the purposes set forth.

2. In a gas-fastener of the character herein set forth, the combination with the knob carrying the pins and the locking-bolts moved by said pins, of a spring-actuated detent projecting up from the interior of the shell and arranged to engage a notch in the base of the operating-knob, substantially as shown and described and for the purposes set forth.

699,885. **KINDS-MOUNTING MACHINE.** JAMES A. WACKNER, Minneapolis, Minn. Filed July 20, 1901. Serial No. 70,000. (No model.)

Claim.—1. A machine or tool for the purpose described having a stock, a side knife fixed therein, a depth-gage, and knives slidable in the stock and adapted to be driven, a knife for removing the chip slidably mounted in the stock, means for operating said knife, and a width-gage.

2. A machine or tool for the purpose described having a stock, a side knife fixed therein, a depth-gage, two end knives slidably mounted in the stock, a lever loosely coupling said end knives, whereby one is withdrawn when the other is driven, a knife for removing the chip, and means for operating said knife.

3. A machine or tool for the purpose described, having a stock, two end knives 4, 4, slidably mounted in the stock, a bearing-rod 7 cut in the stock between said knives, and a lever 6, having its fulcrum in said rod and coupled at its respective ends to said knives.

4. A machine or tool for the purpose described, having a stock, knives mounted thereon for forming the gage, a depth-gage 16 mounted adjustably on the stock, and a wedge 17, mounted slidably on the stock between said gage and an inclined shoulder on the stock, substantially as and for the purposes set forth.

5. A machine or tool for the purpose described, having a stock, a sliding knife 9, mounted in the stock and carrying shoulders 14, adjustable limiting-steps 15 for the said shoulders to impinge upon, and means for operating said knife, substantially as and for the purposes set forth.

6. A machine or tool for the purpose described, having a stock provided with guides 8 for the sliding knife 9, the said knife, sections 21 below the level of said guides, the screws 20 in said sections and forming a width-gage, and the fixed side knife 3, in the stock, substantially as set forth.

699,886. **GRAIN-DOOR FOR CARS.** WILLIAM H. MAHLE and OLYMPIA S. MAHLE, Davenport, Iowa. Filed Dec. 17, 1901. Serial No. 20,200. (No model.)

Claim.—1. In a grain-door for cars, the combination with a door-opening, a retaining-strip at one side of the opening, an inclined track at the other side, and a roller mounted on said door and engaging said track; of a vertical rod having its lower end journaled in a plate sunk in the floor of said car and provided with arms or eccentrics, a bracket holding the upper end of said rod and provided with perforations, a perforated crank-arm secured to the upper end of said rod, a pin for simultaneously engaging the perforation of said crank-arm and one of the perforations of said bracket, and wear-plates on the door opposite said arms, all as and for the purposes set forth.

2. In a grain-door for cars, the combination with a door-opening, a retaining-strip at one side of the opening, an inclined track at the other side, a guard-rail along its length, a door bridging said opening and engaging said retaining-strip, a stub-shaft mounted on the upper corner of said door, and a roller mounted on said stub-shaft and engaging said track; of a vertical rod having its lower end journaled in a plate sunk in the floor of said car and provided with cams or eccentrics, a bracket holding the upper end of said rod, a crank-arm secured to the upper end of said rod, and wear-plates on the door opposite said cams, all as and for the purpose set forth.

699,887. ACETYLENE-GAS GENERATOR. LEO MORTON, New York, N. Y., assignor to Acetylene Manufacturing Company, New York, N. Y., and Jersey City, N. J., a Corporation of New Jersey. Filed Oct. 2, 1900. Serial No. 21,511. (No model.)

Claim.—1. In an acetylene-gas generator, the combination of a container adapted to receive water, a tube extended above the container and adapted to receive the carbide in its lower portion, a generating-chamber supported at the lower end of said tube, a pressure-equalizing chamber formed in the upper part of the container, and a small tube connecting the upper part of the first-named tube with said pressure-equalizing chamber.

2. In an acetylene-gas generator, the combination with a carbide-container of a scraper provided with means engaging directly with the carbide to remove the coating therefrom.

3. In an acetylene-gas generator, the combination with the container adapted to receive water and a carbide-container, of a scraper provided with teeth to engage with the carbide mounted in the container first named, and means external to said container to operate said scraper to remove the coating from the carbide.

4. In an acetylene-gas generator, the combination with a container adapted to receive water, a generating-chamber having an outlet, a stop-cock to control said outlet, and a lifter to raise the carbide from the water, of an actuator operatively connected with said lifter and said stop-cock to operate the same simultaneously.

699,888. BOILER. JAMES M. McLELLAN, Everett, Mass. Filed July 8, 1901. Serial No. 67,451. (No model.)

Claim.—1. A flue for a boiler, having inclosed therein and extending longitudinally thereof a plurality of spirally-arranged water-tubes, said tubes dividing the interior of the flue into two independent compartments.

2. In a tubular boiler, a plurality of flues extending therethrough, and a series of spirally-arranged water-tubes inclosed in and extending longitudinally of each of said flues.

3. In a tubular boiler, a boiler-shell, a plurality of flues therein, a plurality of water-tubes extending longitudinally of each flue, said water-tubes dividing the interior of the flues longitudinally into a plurality of sinuous compartments.

4. In a tubular boiler, a boiler-shell, a plurality of flues therein, and a plurality of water-tubes extending longitudinally of each flue, said water-tubes dividing the interior of the flues longitudinally into a plurality of independent compartments.

5. In a boiler, a boiler-shell, a plurality of flues therein, each of said flues having at each end a header extending across the interior thereof, a plurality of water-tubes connected to said headers, said water-tubes having communication at their ends with the interior of the boiler-shell.

6. In a boiler, a boiler-shell, a plurality of flues therein, headers on the interior of said flues extending transversely across each flue near its ends,

and spirally-arranged water-tubes connecting said headers, the ends of said water-tubes having communication with the interior of the boiler-shell.

7. In a boiler, a boiler-shell having a plurality of flues therein, headers in the interior of each flue near each end thereof, a water-tube connecting the headers in each flue and extending centrally of the flue, and a port extending transversely through the flue and through each header whereby said water-tube has a free communication with the interior of the boiler-shell near each end thereof.

8. In a boiler, a boiler-shell having a plurality of flues therein, a header extending across the interior of each flue near each end thereof, spirally-arranged water-tubes connecting the headers in each flue, and an opening extending transversely through the flue and each header and furnishing communication between the water-tubes and the interior of the shell.

9. In a boiler, a boiler-shell having a plurality of flues, a series of spirally-arranged water-tubes inclosed by each flue, and extending longitudinally thereof, the water-tubes of each series being in contact with each other and the outer tubes of the series engaging the inner wall of the flue, whereby each flue is divided into two sinuous compartments.

699,889. SKIRT AND WAIST SUPPORTER. JAMES C. McDONALD, Davenport, Iowa. Filed Oct. 10, 1901. Serial No. 73,208. (No model.)

Claim.—1. A supporting device for connecting and supporting garments, comprising a body-encircling belt, a ball-and-socket fastening having one of its members secured to said belt and the opposite member secured to one garment, and an eyelet-carrying flap secured at its upper edge only to the opposite garment and slanted between the members of the ball-and-socket fastening.

2. A supporting device for an upper and a lower garment comprising a flap secured to the upper garment and having one or more eyelets, a body-encircling belt adapted to pass between the flap and the upper garment and carrying one member of a ball-and-socket fastening, the opposite member of said fastening being secured to the lower garment, substantially as specified.

3. A supporting device for an upper and a lower garment comprising a flap secured at its upper edge to the rear of the upper garment and provided on opposite sides of the center with metallic eyelets, a body-encircling belt adapted to pass under said flap on the exterior of the upper garment and provided at its ends with securing devices, said-attaching members secured to said belt in alignment with the metallic eyelets, and socket members adapted for attachment to the lower garment and adapted for engagement with said said members.

4. A supporting device for an upper and a lower garment comprising a flap secured at its upper edge to the rear of the upper garment and provided on opposite sides of the center with enlarged metallic eyelets, a body-encircling belt, adapted to pass under said flap on the exterior of the upper garment and provided at its ends with securing devices, stud-attaching members secured to said belt in alignment with the metallic eyelets, and cocket members for attachment to the lower garment and adapted for engagement with said stud members, the eyelets being of larger diameter than the stud and cocket members in order to permit lateral adjustment of the garments.

5. A supporting device for an upper and a lower garment comprising a flap secured at its upper edge to the rear of the upper garment and provided on opposite sides of its center with enlarged metallic eyelets, a body-encircling belt adapted to pass under said flap on the exterior of the upper garment, stud-attaching members secured to said belt in alignment with the metallic eyelets and of a diameter considerably less than that of said eyelets to permit lateral adjustment of the garments, and cocket members having attaching-plates of a length greater than the diameter of the eyelets and adapted to be secured to the inner portion of the waistband of the lower garment.

6. In combination, a waist having an eyelet member secured at its upper end only to the waist, a belt adapted to encircle the waist of the wearer, said belt passing under said eyelet member, a member of a belt-and-cocket fastener carried by the belt in alignment with the eyelet, and a skirt having a mating belt-and-cocket member adapted to engage with the member carried by the belt.

689,840. RAILWAY-CAR. HARRY McLOUGHLIN, Stapleton, N. Y. assignor to Barton R. Kingman, New York, N. Y. Filed Aug. 31, 1901. Serial No. 72,908. (No model.)

Claim.—1. A frame for railway-cars, comprising vertical metallic tubular corner-posts and horizontal metallic tubular stringers, said tubular stringers being recessed on their inner sides to fit the corner-posts and bent around the latter, substantially as described.

2. A frame for railway-cars, comprising vertical metallic tubular corner-posts and horizontal metallic tubular stringers, said tubular stringers being recessed on their inner sides to fit the corner-posts and bent around the outer faces of the latter, the corner-posts and stringers being riveted together, substantially as described.

3. A frame for railway-cars, comprising vertical metallic tubular corner-posts and horizontal metallic tubular stringers, said tubular stringers being recessed on their inner sides to fit the corner-posts and bent around the outer faces of the latter, the corner-posts and stringers being riveted

together, and the inner sides of the said corner-posts being apertured on their inner sides for the insertion of riveting-tools, substantially as described.

4. A frame for railway-cars, comprising vertical metallic tubular corner-posts and horizontal metallic tubular stringers, said tubular stringers being recessed on their inner sides to fit the corner-posts and bent around the outer faces of the latter, the ends of the recessed portions of the stringers being provided with tongues or flanges struck up from the walls of the stringers and riveted to the corner-posts, said corner-posts being apertured on their inner sides for the insertion of riveting-tools, substantially as described.

5. A frame for railway-cars, comprising vertical corner-posts consisting of metallic tubes each having two outer flat faces disposed at a right angle to one another and united by a rounded corner, and an inner concave-convex wall having flat edge portions, the edges of the flat outer faces being rounded and joined to the flat edge portions of the inner wall, and horizontal stringers consisting of metallic tubes having inner flat faces and outer rounded faces, the inner sides of the stringers being recessed to fit the corner-posts and bent around the outer faces of the latter, and said stringers and corner-posts being riveted together, substantially as described.

6. A frame for railway-cars, comprising vertical metallic tubular corner-posts, intermediate metallic tubular standards, and horizontal metallic tubular stringers, said tubular stringers being recessed on their inner sides to fit the corner-posts and standards and riveted to said corner-posts and standards, substantially as described.

7. A frame for railway-cars, comprising vertical metallic tubular corner-posts, intermediate metallic tubular standards, and horizontal metallic tubular stringers, said tubular stringers being recessed on their inner sides to fit the corner-posts and standards and riveted to said corner-posts and standards, the inner sides of the corner-posts and standards being apertured for the insertion of riveting-tools, substantially as described.

8. A frame for railway-cars, comprising vertical metallic tubular corner-posts, intermediate metallic tubular standards, and horizontal metallic tubular stringers recessed on their inner sides to fit the corner-posts and standards, the ends of the recessed portions of the stringers being provided with integral tongues or flanges struck up from the stringers and riveted to the corner-posts and standards, said corner-posts and standards being apertured on their inner sides for the insertion of riveting-tools, substantially as described.

9. A frame for railway-cars, comprising vertical metallic tubular corner-posts, intermediate metallic tubular standards, and horizontal metallic tubular stringers recessed on their inner sides to fit the corner-posts and standards and riveted to said corner-posts and standards, and tubular sections fitted between the ends of adjacent standards and fastened to the latter, substantially as described.

10. A frame for railway-cars, comprising vertical metallic corner-posts, intermediate metallic tubular standards, and horizontal metallic tubular stringers, said standards and stringers consisting of metallic tubes each having a flat inner face or wall and a rounded outer face or wall, the stringers being recessed on their inner sides to fit the standards and corner-posts and riveted thereto, the flat sides of the stringers and standards lying flush with one another, substantially as described.

11. A frame for railway-cars, comprising vertical metallic corner-posts, intermediate metallic tubular standards, and horizontal metallic tubular stringers, said tubes being provided with flat inner portions lying flush with one another and riveted together, and panels fitted against said flat portions of the corner-posts, standards and stringers and riveted thereto, substantially as described.

12. A frame for railway-cars, comprising vertical metallic corner-posts, intermediate metallic tubular standards, horizontal metallic tubular stringers, and tubular sections fitted between the ends of the standards, said stringers being recessed on their inner sides to fit the standards and corner-posts and riveted thereto, said tubes having flat inner portions lying flush with one another, and panels fitted against said flat portions of the tubes and riveted thereto, substantially as described.

13. A frame for railway-cars, comprising vertical metallic corner-posts, intermediate metallic tubular standards, horizontal metallic tubular stringers, and metallic tubular sections arranged between the ends of the standards, brackets interposed between the adjacent ends of the standards and tubular sections and lying flush therewith, said brackets each having two lateral tongues fitted in the ends of adjacent tubular sections and a vertical tongue fitted in the end of an adjacent standard, and panels secured to the inner sides of the corner-posts, standards, stringers and tubular sections, substantially as described.

14. A metallic frame for railway-cars, comprising tubular sills, vertical tubular corner-posts rigidly fastened at their lower ends to the sills, intermediate tubular standards, horizontal tubular stringers fastened to the corner-posts and standards, tubular sections arranged between the lower ends of the standards, brackets arranged between the contiguous ends of

the tubular sections and standards and lying flush therewith, each of said brackets having two lateral tenses fitted in the ends of the adjacent tubular sections and a vertical tense fitted in the lower end of the adjacent standard, and a lag or foot projecting horizontally inward from the bracket and latched to the adjacent sill, substantially as described.

15. A metallic frame for railway-cars, comprising tubular side and end sills rigidly secured together at their meeting ends and each consisting of a metallic tube having a flat horizontal and a flat vertical face or wall and a concave-convex inner face or wall, vertical tubular standards, horizontal tubular stringers fastened to the standards, tubular sections arranged between the lower ends of the standards and tubular sections and lying flush therewith, each of said brackets having two lateral tenses fitted in the ends of the adjacent tubular sections and a vertical tense fitted in the lower end of the adjacent standard, and a lag or foot projecting horizontally inward from the bracket and resting on and riveted to the upper flat face of the adjacent sill, the inner face of the sills being apertured for the insertion of riveting-tools, substantially as described.

16. A metallic frame for railway-cars, comprising side and end sills each consisting of a metallic tube having a flat horizontal and a flat vertical face or wall and a concave-convex inner wall, corner-brackets fitted between the contiguous ends of the sills and each consisting of an elbow having lateral tenses arranged at a right angle to one another and fitted in the contiguous ends of the sills, horizontal lugs or flanges projecting inwardly from the brackets, tubular corner-posts riveted to the said lugs or flanges and horizontal stringers fastened to the corner-posts, substantially as described.

17. A metallic frame for railway-cars, comprising side and end sills each consisting of a metallic tube having a flat horizontal and a flat vertical face or wall and a concave-convex inner wall, corner-brackets fitted between the contiguous ends of the sills and each consisting of an elbow having lateral tenses arranged at a right angle to one another and fitted in the contiguous ends of the sills and provided with a horizontal inwardly-projecting lug or flange, vertical standards secured to the sills, horizontal stringers fastened to the standards, tubular sections fitted between the lower ends of the standards and secured thereto, vertical tubular corner-posts disposed above said brackets, brackets provided with lateral tenses fitted in the ends of adjacent tubular sections and with vertical tenses fitted in the lower ends of the corner-posts, and having horizontal inwardly-projecting lugs or feet riveted to the lugs or flanges of the corner-brackets, uniting the sills, substantially as described.

18. A metallic frame for railway-cars, comprising vertical tubular standards, horizontal tubular stringers recessed on their inner sides to fit the standards and riveted thereto, and tubular sections arranged between the ends of the standards and connected thereto, panels fitted and riveted to the inner sides of the tubular standards, stringers and tubular sections, said tubes being apertured on their inner sides for the insertion of riveting-tools, substantially as described.

19. A metallic frame for railway-cars, comprising tubular side and end sills rigidly secured together at the corners, a central longitudinal truss consisting of a hollow tubular trans-beam provided on its opposite vertical sides with sockets, and brace-rods fitted at their inner ends to said sockets and connected at their outer ends to the side sills, substantially as described.

20. A metallic frame for railway-cars, comprising tubular side and end sills rigidly connected together at the corners, a central longitudinal truss consisting of top and side plates and a bottom frame fastened together to form a hollow trans-beam, which is attached to the opposite vertical sides of the trans-beam and to the interior of the tubular side sills, and brace-rods fitted at their opposite ends respectively to the sockets on the trans-beam and the sockets in the said sills, said side sills being apertured on their inner sides for the passage of the brace-rods and for the insertion and attachment of the sockets, substantially as described.

699,841. **BRACKET-PANTRY.** JOHN E. McMAHON, Goodhope W. Va. Filed Sept. 12, 1901. Serial No. 74,973. (No model.)

Claim.—1. In a bracket-pantry, a member having a rounded head with its opposite sides flattened and having corresponding ears extending inward about at a right angle to the plane of the flattened sides to form yielding side portions, and a compression member having an oblong opening and a socket extended from the plate in line with the opening and having its opposite sides flattened, said socket and an edge portion of the plate being split, substantially as set forth.

2. In a bracket-pantry, a collar-button comprising a flat stem, a foot and a head and a head having flattened sides and inwardly-extending

ing ends, and a member for attachment to a necktie and comprising a plate having an oblong opening and a socket extended from the plate in line with the opening and having its opposite sides flattened, said socket and an edge portion of the plate being split, substantially as set forth.

699,842. **TAIL-BOARD SPRING.** FREDMAN BUCKINGHAM, JR., Fall River, Mass. Filed Jan. 25, 1902. Serial No. 91,204. (No model.)

Claim.—1. The combination with a tail-board spring consisting of a strip of spring metal having screw-bolts near one end, of a reinforcing-plate covering one of said bolts, and provided with lateral lugs bent down on each side of said spring.

2. The combination with a tail-board spring consisting of a strip of spring metal having screw-bolts near one end, of a reinforcing-plate covering one of said bolts, and extending rearwardly from said bolt.

699,843. **HOISTING-SOCKET.** ALBERT E. NORMAN, Cambridge, Mass., assignor to Evers & Norman Manufacturing Company, Cambridge, Mass. Filed Oct. 17, 1901. Serial No. 73,954. (No model.)

Claim.—1. A hoisting-socket comprising two bucket-sockets pivotally connected together, a head, links connecting the head and bucket-sockets, a series of sheaves carried on the pivotal connection between said bucket-sockets, a corresponding series of sheaves mounted in the head, and an opening and closing chain passing around the sheaves of said two series, the sheaves of one series having an angular relation to the sheaves of the other series, whereby these portions of the said chain stretching between the sheaves are substantially at right angles to the axis of said sheaves.

2. In a hoisting-socket, two bucket-sockets pivotally connected together, a head, links connecting said head and bucket-sockets, a series of axially-aligned sheaves carried by the bucket-sockets, a second series of axially-aligned sheaves mounted in said head, and an opening and closing chain passing over said sheaves, the axes of the two series of sheaves having an angular relation to each other.

3. In a hoisting-socket, two bucket-sockets pivotally connected together, a head, links connecting said head and bucket-sockets, a series of axially-aligned sheaves mounted on the pivotal connection between said bucket-sockets, said head having its upper portion squared with the bucket-sockets, and its lower portion formed to receive sheaves rotating about an axis having an angular relation to the axis of said first-mentioned sheaves, and an opening and closing chain passing about said sheaves.

4. In a clam-shell hoisting-socket having two pivoted bucket-sockets, a head having an upper portion squared with said bucket-sockets and to which said segments are connected, and a lower sheave-receiving portion having an angular relation to the said bucket-sockets.

5. In a clam-shell hoisting-socket, two pivoted bucket-sockets, a head having an upper portion squared with said bucket-sockets and to which said segments are connected, and a lower sheave-receiving portion having an angular relation to the said bucket-sockets, and a guide-eye

extended laterally from one end of said upper portion, combined with an opening and closing chain passing through said guide-eye.

6. In a clam-shell hoisting-socket having two pivoted bucket-sockets, a head having an upper portion squared with said bucket-sockets and to which said segments are connected, and a lower sheave-receiving portion having an angular relation to said bucket-sockets, said head having a laterally-extended guide-eye directed adjacent one end of said upper portion, and a leader surrounding the opening and closing chain and detachably secured to said guide-eye, combined with the said opening and closing chain.

7. In a clam-shell bucket, two bucket-sockets pivotally together, a series of sheaves mounted on the pivotal connection between the segments, a head carrying a second series of sheaves cooperating with said first-mentioned series, an opening and closing chain passing over said sheaves, said head having a laterally-extended guide-eye substantially in line with the end sheave of the first-mentioned series.

8. In a clam-shell bucket, two bucket-sockets pivotally connected together, a series of sheaves mounted on the pivotal connection between the said segments, a head carrying a second series of sheaves cooperating with said first-mentioned series, said second series of sheaves having an angular relation to the sheaves of the first series, a guide-eye extended laterally from the head substantially in line with the end sheave of the first-mentioned series, combined with an opening and closing chain passing through said guide-eye and around said sheaves, the construction being such that the runs of the chain between the sheaves are substantially at right angles to the axis of said sheaves.

9. In a hoisting-socket, two bucket-sockets, a head, connections between said head and bucket-sockets, and a series of sheaves carried by the bucket-sockets and turning about a common axis, a second series of sheaves mounted in the head and also having a common axis, and an opening and closing chain passing about all of said sheaves and operating to open and close both bucket-sockets simultaneously, the axes of the two series of sheaves having such an angular relation to each other that the runs of the chain between the sheaves are substantially at right angles to the axis of said sheaves.

10. In a hoisting-socket, two bucket-sockets, a series of sheaves carried thereby, a head, a second series of sheaves mounted therein, the sheaves in the head having an angular relation to the sheaves carried by the bucket-sockets, an opening and closing chain passing around the sheaves of both series, an arm rigid with the head and to which the end of the opening and closing chain is fastened, said arm being directed substantially over the end sheaves of the series carried by the bucket-sockets.

11. In a hoisting-socket, two bucket-sockets, a head having an upper portion squared with said segments and to which the segments are connected, and a lower sheave-receiving portion having an angular relation to said bucket-sockets, an arm rigid with the lower sheave-receiving portion of the head and to which the end of the opening and closing chain is adapted to be secured.

12. In a hoisting-socket, two bucket-sockets, a plurality of sheaves carried thereby, a head, a series of sheaves carried thereby and having an angular relation to the sheaves carried by the bucket-sockets, an opening and closing chain passing around the sheaves of both series, an arm rigid with the head and to which the end of the opening and closing chain is attached, said arm being in alignment with the portion of the chain secured thereto, and being directed substantially over the end sheaves of the series carried by the bucket-sockets.

699,844. **MECHANICAL TOY.** GEORGE E. FARR, Fayetteville, E. C. Filed Nov. 7, 1901. Serial No. 81,498. (No model.)

Claim.—1. A device of the character described, comprising a hollow body having a characteristic head and feet, the latter being provided

with a movable lower jaw, means for yieldably holding the movable jaw normally closed, a resilient diaphragm stretched across the hollow head, and a manipulating-cord operatively connected with the movable jaw and in operative relation with the resilient diaphragm.

2. A device of the character described, comprising a hollow body having a fixed characteristic head and feet at one end thereof, the feet being provided with a fixed jaw and a movable jaw, a spring to hold the latter jaw normally closed, a resilient diaphragm stretched across and closing the opposite end of the body, and a manipulating-cord connected to the movable jaw and in operative relation with the resilient diaphragm.

3. A device of the character described, comprising a hollow body, a movable member carried thereby, a resilient diaphragm also carried by the body and provided with a perforation, a manipulating-cord connected to the movable member and projected through the perforation of the diaphragm, and a stop carried by the cord and in operative relation to the diaphragm.

4. A device of the character described, comprising a hollow body, a characteristic head at one end of the body and provided with a movable jaw, a resilient diaphragm closing the opposite end of the body and provided with a perforation, a manipulating-cord projected through the perforation and connected to the movable jaw, and a stop carried by the cord within the body and in operative relation to the diaphragm.

5. A device of the character described, comprising a hollow body having a fixed characteristic head and feet, the latter being provided with a fixed upper jaw and a movable lower jaw, a spring-actuated bell-crank lever mounted in the body and having one arm connected to the movable jaw to normally hold the latter closed, a resilient diaphragm stretched across the hollow body, and a manipulating-cord connected to the other arm of the lever and in operative relation with the diaphragm.

6. A device of the character described, comprising a hollow body having a characteristic head and feet, the latter being provided with a fixed jaw and a movable jaw, a spring-actuated bell-crank lever within the body, one arm of the lever being connected to the movable jaw to hold the latter normally closed, a resilient diaphragm stretched across the body, and an operating-cord connected to the other arm of the lever and in operative relation with the diaphragm.

7. A device of the character described, comprising a hollow body, a characteristic head at one end of the body and having a movable jaw, a resilient diaphragm closing the opposite end of the body and provided with a perforation, a spring-actuated bell-crank lever mounted within the body and having one arm connected to the movable jaw, a manipulating-cord projected through the perforation in the diaphragm and connected to the other arm of the lever, and a stop carried by the cord and in operative relation to the inner side of the diaphragm.

8. A device of the character described, comprising a hollow body, a movable member carried thereby, a resilient diaphragm also carried by the body, a spring-actuated lever mounted within the body and connected with a movable member, a link connected to the lever and projected through a perforation in the diaphragm, the link being twisted into a loop adjacent to the inner side of the diaphragm to form a stop for engagement therewith, and a cord connected to the outer free end of the link.

9. A device of the character described, comprising a hollow body, a movable member carried thereby, a resilient diaphragm also carried by the body, a transverse pin or rod within the body, a wire doubled upon itself to form an arm, and having its opposite portions twisted into spring-coils embracing the rod or pin, the outer end of one of the coils being connected to the body, and the outer end of the other coil being extended to form an arm connected to the movable member, and an operating-cord connected to the first-mentioned arm and in operative relation to the diaphragm.

10. A device of the character described, comprising a hollow body, a characteristic head at one end of the body and provided with a movable jaw, a transverse rod or pin within the body, a wire doubled upon itself to form a downwardly-inclined arm, the head of the wire being formed into a hook, the opposite portions of the wire being twisted into spring-coils embracing the rod or pin, the outer end of one of the coils being connected to the body, the outer end of the other coil being extended into an arm connected to the movable jaw, a wire link connected to the hook of the first-mentioned arm and having its opposite end projected through a perforation in the diaphragm, an intermediate portion of the link being twisted into a loop to form a stop in operative relation to the inner side of the diaphragm, and a cord connected to the outer free end of the link.

699,845. **APPARATUS FOR THE TREATMENT OF SEWAGE.** ANDREW J. FARRER, JR., Brooklyn, N. Y. Filed Apr. 4, 1901. Serial No. 84,500. (No model.)

Claim.—1. In an apparatus for purifying sewage by bacterial action the combination of a first compartment for the reception of the sewage from the sewer and adapted to encourage bacterial growth, a second compartment likewise adapted and a pervious partition between said

compartments, adapted to detain in the first compartment a given size of solid constituents of the sewage and to pass into the second compartment such solid constituents of lower size, substantially as and for the purposes described.

2. In an apparatus for purifying sewage by bacterial action the combination of a compartment adapted to the growth and action of anaerobic bacteria a second compartment adapted to the growth and action of facultative bacteria and a filtering-partition between the said compartments, substantially as and for the purposes described.

3. In an apparatus for purifying sewage by bacterial action the combination of a compartment adapted to the growth and action of anaerobic bacteria and to the reception and partial detention of the sewage from the sewer, a second compartment likewise adapted to the growth and action of anaerobic bacteria, a filter connecting said two compartments and adapted to resist the passage of a certain size of particles of the solid constituents of the sewage and to permit the passage of all smaller ones, a third compartment adapted to the growth and action of facultative bacteria and a filter connecting said last-mentioned compartment with the aforesaid second compartment and adapted to detain substantially all solid constituents in said second compartment, substantially as and for the purposes described.

4. In an apparatus for purifying sewage by bacterial action the combination of a compartment adapted to the growth and action of anaerobic bacteria and to the reception and partial detention of the sewage from the sewer, a second compartment likewise adapted to the growth and action of anaerobic bacteria, a filter connecting said two compartments and adapted to resist the passage of a certain size of particles of the solid constituents of the sewage and to permit the passage of all smaller ones, a third compartment adapted to the growth and action of facultative bacteria and a filter connecting said last-mentioned compartment with the aforesaid second compartment and adapted to detain substantially all solid constituents in said second compartment and a fourth compartment connected with said last-mentioned third compartment and adapted to the growth and action of aerobic bacteria, substantially as and for the purposes described.

5. In an apparatus for the purification of sewage by bacterial action a series of three successively-interconnecting compartments having the same water-level, the first adapted to the action and growth of anaerobic bacteria and to the reception of the sewage from the sewer, the second likewise adapted to the growth and action of anaerobic bacteria and communicating with the first through a filter adapted to detain in the latter a certain size of particles of the solid constituents of the sewage and to admit passage into the latter with the liquid constituents of all smaller-sized particles of said solid constituents, the third compartment adapted to the growth and action of facultative bacteria and connected with the second compartment through a filter adapted to detain in the latter substantially all its contained solid constituents of the sewage, substantially as and for the purposes described.

6. In an apparatus for purifying sewage by bacterial action and containing a plurality of interconnecting compartments adapted to successive stages of treatment of such sewage a final retaining wall or dam having a horizontally-extended upper edge determining the level of the liquid in all of said compartments and in combination therewith an inwardly and downwardly extending and correspondingly horizontally extended projection forming a head for said upper edge and projected downwardly beneath the surface of the liquid, substantially as and for the purposes described.

7. In an apparatus for purifying sewage by bacterial action and consisting of one or more compartments adapted to temporarily detain the sewage a partition or wall having a horizontally and longitudinally extended inner chamber provided with outlets on upper edge correspondingly longitudinally and horizontally extended above the bottom of each chamber and fixing the level of the liquid in each compartment or compartments and an inwardly and downwardly and correspondingly horizontally and longitudinally extended projection covering said chamber and said edge and projecting downwardly into the liquid below its said level substantially as and for the purposes described.

8. In an apparatus for purifying sewage by bacterial action and consisting of one or more compartments adapted to temporarily detain the sewage a partition or wall having a horizontally and longitudinally extended inner chamber provided with outlets on upper edge correspondingly longitudinally and horizontally extended above the bottom of each chamber and fixing the level of the liquid in each compartment or com-

partments and an inwardly and downwardly and correspondingly horizontally and longitudinally extended projection covering said chamber and said edge and projecting downwardly into the liquid below its said level, a partition or wall *d* containing a longitudinally-extended and horizontally-extended inner chamber *f* having outlets *e* a correspondingly horizontally and longitudinally extended upper edge *e'* and over the said chamber and edge an inwardly and downwardly projecting and correspondingly horizontally and longitudinally extended projection or head *e''* having a lower edge or lip *e'''* below the level of the liquid, substantially as and for the purposes described.

699,846. CAR-MAKER. LOUIS T. FROST, Philadelphia, Pa., assignor to John E. Rayburn, Philadelphia, Pa. Filed Dec. 17, 1900. Renewed Oct. 16, 1902. Serial No. 72,067. (No model.)

Claim.—1. In a brake, a truck-frame, wheels supporting the truck, brake heads and shoes front and back of each wheel, the front heads of each wheel, and the back heads of each wheel being attached to longitudinal bars, and all the heads and shoes for each side of the truck being actuated by toggle mechanism from one point, between the wheels.

2. In a brake, a truck-frame, wheels for the truck, brake heads and shoes at the front of each wheel, longitudinal bars connecting the brake-heads; brake heads and shoes at the back of each wheel, longitudinal bars connecting the brake-heads, and toggle means located between the wheels at each side of the truck to simultaneously force the front and back shoes to the wheels.

3. In a brake, a truck-frame and wheels, brake heads and shoes front and back of each wheel, the front heads of each wheel on each side of the truck being connected by a longitudinal bar placed outside of the wheels; the back heads on each wheel on each side of the truck being connected by a longitudinal bar, placed outside of the wheels, and means to operate the front and back heads of each side to simultaneously move to and press the wheels.

4. In a brake, a truck-frame and wheels, brake heads and shoes at the front and back of each wheel, the heads and shoes at the front of the wheels, on each side of the truck, being longitudinally connected by a bar outside of the wheels, which is rigidly attached to one head and is adjustably attached to the other head; the heads and shoes at the back of the wheels, on each side of the truck, being longitudinally connected by a bar outside of the wheels, which is rigidly attached to one head and is adjustably attached to the other head; and means operative at each side of the truck to force all of the shoes at that side to the wheels simultaneously.

5. In a brake, a truck-frame and wheels, brake heads and shoes for each side of each wheel, and toggle means to simultaneously press the front heads and shoes and the back heads and shoes to the wheels, for operative contact.

6. In a brake, a truck-frame and wheels, heads and shoes for the wheels, at the front and back of each wheel, a longitudinal tie-bar connecting the front heads and shoes of each side of the truck, the back be-

ing located outside of the wheels; a longitudinal tie-bar connecting the back heads and shoes of each side of the truck, the bars being located outside of the wheels; the tie-bars for the front heads and shoes and the tie-bars for the back heads and shoes overreaching each other at the side center of the truck, and toggle means at each side center of the truck having compression members thereto and to the brake-heads between the wheels, whereby all the heads and shoes are pressed to contact with all the wheels, at the same time, by said centrally-located toggle means.

7. In a brake, a truck-frame and wheels, a toggle mechanism at the center of each side of the truck, means to connect the toggle mechanism to operate brake heads and shoes at each side of the wheels, on each side of the truck simultaneously, and adjusting means on the toggles whereby the wear on the shoes is taken up by a single operation.

8. In a brake-toggle, a pull-bar, push-bar extending outward and connected to brake-heads at their outer ends, and at their inner ends resilient lifting-links connected thereto, reaching therefrom and connected and attached to the head or upper end of the pull-bar aforesaid.

9. In a brake, a truck-frame, wheels thereon, brake heads and shoes for the wheels, and hangers for the heads having substantially parallel members having means for connection to the brake-head, at their lower ends, means for connection to a supporting-bracket, and therefrom united above said bracket-supporting point.

699,847. REVELING OR TRAVELING BEATER-COVER. JOHN E. BARAK and JOHN E. ROSENTHAL, Grand Rapids, Mich.; said Barak assignor to said Rosenthal. Filed June 2, 1901. Serial No. 68,712. (No model.)

Claim.—1. A beater-cover for threshing-machines, consisting of a pliable piece of material, preferably rectangular and oblong in shape; slats secured to the inner face and crosswise of the said pliable material; straps perforated at their tail ends, and provided with buckles at their head ends, and secured to the inner face of the pliable material, and the inner faces of the slats; perforated straps secured to the inner face and tail end of the pliable material; straps and buckles corresponding with said last-mentioned straps, and secured to the outer face and head end of said pliable material, substantially as shown and described and for the purposes set forth.

2. A beater-cover for threshing-machines, consisting of a pliable piece of material, preferably rectangular and oblong in shape; slats secured crosswise and on the inner face of said pliable material; straps secured to the inner face of the pliable material, and inner faces of the slats; said straps being provided at their tail ends with perforations, and at their head ends with buckles; said beater-cover adapted to be secured around a pair of beaters, and further around said beaters by suitable means, substantially as shown and described and for the purposes set forth.

3. A traveling or revolving beater-cover for threshing-machines, consisting of a pliable piece of material, preferably rectangular and oblong in shape; slats, or other suitable material to answer the same purpose, secured to the inner or outer, or both faces of said pliable material, and across the same; straps perforated at their tail ends, and provided with buckles at their head ends, and secured to the inner face of the pliable material, and the inner faces of the slats; perforated straps secured to the inner face and tail end of the pliable material, at its head end, and the inner faces of the slats; perforated straps secured to the inner face and tail end of the pliable material; straps and buckles corresponding with said last-mentioned straps, and secured to the outer face and head end of said pliable material, substantially as shown and described and for the purposes set forth.

4. A traveling or revolving beater-cover for threshing-machines, consisting of a pliable piece of material, preferably rectangular and oblong in shape; slats, or other suitable material secured crosswise the inner or outer, or both faces of the pliable material; straps secured to the inner face of the pliable material, and inner faces of the slats, or other suitable material used; said straps being provided at their tail ends with perforations and at their head ends with buckles; said traveling or revolving beater-cover, adapted to be secured around a pair of beaters, or a single

beater on threshing-machines, and further around said beater by a suitable means, substantially as shown and described and for the purposes set forth.

699,848. BRUSH. GEORGE R. RICHARDSON, Leam, Wm. Filed May 11, 1901. Serial No. 68,808. (No model.)

Claim.—1. In a brush, a handle having a kerf extending therein from one end, and a brush-frame fitted in the said kerf and having a depression in its edge to receive and embrace opposite sides of the handle in line with and adjacent the inner end of the said kerf, and means for connecting the parts of the handle separated by the kerf and clamping the brush-frame therebetween, substantially as set forth.

2. In a brush, a handle having a kerf formed therein at one end, a frame comprising spaced bars and having a portion crimped to form a depression, brush material folded about said spaced bars and secured thereto, the crimped portion of the frame entering the kerf of the handle and embracing opposite sides thereof and the folded part of the brush material fitting in a notch in the end of the handle and means for connecting and clamping the separated parts of the handle against opposite sides of the brush-frame, substantially as set forth.

699,849. HOOP-PLIERS. JAMES F. SARGENT, Jr., Grand Rapids, Mich., assignor of one-half to Owen R. Chaffee, Grand Rapids, Mich. Filed Nov. 21, 1901. Serial No. 68,908. (No model.)

Claim.—1. An implement of the character specified, comprising two jaws, the outer side of the terminal of each of which is provided with a transversely-disposed clamping-band-engaging recess, the said recesses being adapted simultaneously to receive the ends of the clamping-band and to retain them until the band has been secured in position around the hoop.

2. An implement of the character specified, comprising two jaws, the outer side of the terminal of each of which is provided with a transversely-disposed clamping-band-engaging recess, the terminal of one jaw projecting beyond that of the other, the said recesses being adapted simultaneously to receive the ends of the clamping-band and to retain them, until the band has been secured in position around the hoop.

699,850. POWER-PRESS. GEORGE R. THOMAS, Johnstown, Pa. Filed Aug. 4, 1901. Serial No. 68,992. (No model.)

Claim.—1. A power-press having a toggle-joint, means for actuating the toggle-joint, and power-actuated mechanism arranged to automatically adjust the fixed point of the toggle and thereby change the position of the tool; substantially as described.

2. A power-press having a toggle-joint arranged to actuate a tool, means for actuating the toggle-joint, and an inclined block having connections arranged to adjust the fixed point of the toggle; substantially as described.

3. A power-press having a toggle-joint arranged to actuate a tool, a cylinder arranged to move the toggle-joint, and another cylinder having connections arranged to automatically adjust the fixed point of the toggle; the latter cylinder being of insufficient power to actuate the tool in its working stroke, and arranged to merely adjust the position of the tool substantially as described.

4. A power-press having a toggle-joint connected to and arranged to actuate a plunger, a lever connected to the plunger, and means for

swinging the lever to adjust the fixed point of the toggle; substantially as described.

5. A power-press having a toggle-joint connected to and arranged to actuate a tool, a lever connected to the toggle, a link connected to the lever and having an inclined face, and a sliding block having an inclined face arranged to rest upon the link to adjust the position of the fixed point of the toggle; substantially as described.

6. A power-press having a toggle-joint connected to and arranged to actuate a tool, a lever connected to the main link of the toggle and arranged to change the fixed point of the toggle, and mechanism for swinging the lever; substantially as described.

7. A power-press having a toggle-joint arranged to actuate a tool, a cylinder arranged to actuate the toggle, and automatically-acting mechanism arranged to adjust the position of the fixed point of the toggle and drawing the tool to the desired point before the toggle-link is actuated to move the tool; substantially as described.

8. A power-press having a toggle-joint arranged to actuate a tool, a cylinder arranged to actuate the toggle, and a smaller cylinder having connections arranged to adjust the fixed point of the toggle; the latter cylinder being of insufficient power to move the tool through its working stroke substantially as described.

9. A power-press having a toggle-joint arranged to actuate a tool, mechanism for adjusting the fixed point of the toggle and an adjustable stop arranged to regulate the amount of said adjustment; substantially as described.

10. A power-press having a toggle-joint arranged to actuate a tool through a pressure-link, a lever connected to the main side link of the toggle, a link connected to the lever and having an inclined face, a sliding block arranged to rest upon the link, an adjustable stop for the block, and a power-cylinder connected to the block; substantially as described.

11. A power-press having a toggle provided with two levers of different lengths connected together at their adjacent ends, the shorter lever being arranged to actuate the tool, the longer lever having an adjustable fulcrum at its opposite end, said opposite ends of the levers both being on the same side of the joint between the levers, means for applying power to said joint, and mechanism for adjusting the fulcrum of the longer lever; substantially as described.

12. A power-press having a toggle device formed with a longer and a shorter lever with their ends connected together, the opposite ends of the levers both being on the same side of the joint between the levers, a lever connected to the other end of the shorter lever and arranged to actuate the tool, means for applying power to the joint between the two toggle-levers, and an adjustable fulcrum for the longer lever; substantially as described.

13. A power-press having a toggle-joint formed of a longer and a shorter lever pivotally connected at their ends, a power-cylinder connected to the joint between the two toggle-levers, the opposite ends of the levers both being on the same side of the joint between the levers, a third lever pivotally connected to the opposite end of the shorter lever and arranged to actuate the tool, a fixed fulcrum for the opposite end of the longer lever, and mechanism for adjusting said fulcrum; substantially as described.

14. A power-press having a toggle-joint formed of a longer and a shorter lever pivotally connected at their ends, a power-cylinder connected to the joint between the two toggle-levers, a third lever pivotally connected to the other end of the shorter lever and arranged to actuate the tool, a fixed fulcrum for the other end of the longer lever, and mechanism for automatically adjusting the fulcrum to bring the tool to the desired point; substantially as described.

699,851. CHAIN WATER-MOTOR. GEORGE E. THURMON, Colby, Wash. Filed Mar. 12, 1901. Serial No. 50,990. (No model.)

Claim.—1. A water-motor comprising a frame, a sprocket-wheel mounted therein, a chain carrying buckets arranged on said sprocket-wheel, a weighted sprocket-wheel at the bottom of the machine for keeping the chain taut, a guiding frame or baring pivotally suspended on the axle of the lower sprocket-wheel, the said baring or frame engaging the side standards of the machine so as to hold the parts in proper place, and a housing surrounding the bucket-chain for holding water or other liquids therein, substantially as described.

2. A water-motor comprising a frame formed with side standards, a cross-shaft supported at the upper end thereof, a sprocket-wheel carried by the said shaft, a chain passing around the sprocket-wheel and carrying a series of angular-shaped hollow buckets, a lower sprocket-wheel resting upon the lower loop of the chain, a casing or baring suspended upon the lower sprocket-wheel by means of suitable shafting, the said baring and sprocket-wheel serving to maintain the chain in the proper degree of tension, and means for delivering water to the buckets as they descend, the said means also serving to prevent the water from spilling from the buckets, substantially as described.

699,852. VENTILATING APPARATUS. JOHN TITUS, Oyster Bay, and WILLIAM TITUS, Old Westbury, N. Y. Filed Aug. 11, 1902. Serial No. 79,490. (No model.)

Claim.—1. The combination with an air-cooler, a cold-air shaft extended upward from said cooler, a secondary air-shaft parallel with the cold-air shaft, and an air-firing apparatus at the lower ends of the shafts, of a mixing-chamber between the two shafts communicating therewith, and having an outlet to the room or place to be ventilated, registers at the inlets from said air-shafts to said mixing-chamber, and mechanism for simultaneously operating the registers to regulate the relative volumes of air from the two shafts into the chamber, substantially as described.

2. The combination with an air-cooler, a cold-air shaft extended upward from said cooler, a secondary air-shaft parallel with the cold-air shaft, and an air-firing apparatus at the lower ends of the air-shafts for forcing air simultaneously to said shafts, of a mixing-chamber between the two shafts and having an outlet to the room or place to be ventilated, registers at the inlets from said shafts to said mixing-chamber, a thermostat and device for connecting the thermostat with said registers to automatically actuate said registers by the temperature of the room or place to be ventilated, substantially as described.

3. The combination with an air-cooler, a cold-air shaft extended upward from said cooler, a secondary air-shaft parallel with the cold-air shaft, an air-firing apparatus at the lower ends of the shafts, for simultaneously forcing air thereto, and a valve at the throat of said apparatus for regulating the relative volumes of air supplied to the two shafts, of an air-mixing chamber between the two shafts and communicating therewith, registers at the inlets from said air-shafts to said chamber, and mechanism for simultaneously operating the registers to regulate the relative volumes of air from the two shafts into the chamber, substantially as described.

4. The combination with an air-cooler, a cold-air shaft extended upward from said cooler, a secondary air-shaft parallel with the cold-air shaft, an air-firing apparatus at the lower ends of said shafts for simultaneously forcing air thereto, and a valve at the throat of the air-firing apparatus for regulating the relative volumes of air supplied to the two shafts, of an air-mixing chamber between the two shafts and communicating therewith, registers at the inlets from the shafts to the chamber, a thermostat, and device for connecting the thermostat with the registers to automatically actuate the registers by the temperature of the room or place to be ventilated, substantially as described.

5. The combination with an air-cooler, a cold-air shaft extended upward from said cooler, a secondary air-shaft parallel with the cold-air shaft, and an air-firing apparatus at the lower ends of two air-shafts for forcing air simultaneously to said shafts, a mixing-chamber between the two shafts and having an outlet to the room or place to be ventilated, registers at the inlets from the shafts to the chamber, and a register at the outlet of the chamber, into the room or place to be ventilated, of a device actuated by pressure of the air within the chamber and mechanism for transmitting motion from said device to the register at the outlet of the chamber, substantially as described.

6. The combination with an air-cooler, a cold-air shaft extended upward from said cooler, a secondary air-shaft parallel with the cold-air shaft, and an air-firing apparatus at the lower ends of said shafts for forcing air simultaneously thereto, of a mixing-chamber between the two shafts, and having an outlet to the room or place to be ventilated, registers at the inlets from the shafts to the chamber, of a register at the outlet from the chamber to the room or place to be ventilated, an arm provided to said register, a cylinder, the lower end of which communicates with the said chamber, a plunger in said cylinder with its upper end projected from the top thereof, a loaded lever actuated from the plunger, and means for connecting said lever with the register at the outlet of the chamber whereby said register is actuated from the varying pressure within the chamber to regulate the outflow of air from the chamber to the room or place to be ventilated, substantially as described.

7. The combination with an air-cooler, a cold-air shaft extended upward from said cooler, a secondary air-shaft parallel with the cold-air shaft, and an air-firing apparatus at the lower ends of the two shafts, of a mixing-chamber between the said shafts and having an outlet to the room or place to be ventilated, a flexible air-conducting pipe connected to said outlet, registers at the inlets from the two air-shafts to the chamber and mechanism for actuating said registers to regulate the admission of air from the shafts to the chamber, substantially as described.

8. The combination with an air-cooler, a cold-air shaft extended upward from said cooler, a secondary air-shaft parallel with the cold-air shaft, and an air-firing apparatus at the lower ends of said shafts, of a mixing-chamber between said shafts and having an outlet to the room or place to be ventilated, a flexible air-conducting pipe connected to said outlet, a register at said outlet, a pressure-regulator connected with said register, registers at the inlets from the two shafts to the mixing-chamber, and mechanism for simultaneously operating the said registers to regulate the relative volumes of air passed from the shafts to the chamber, substantially as described.

9. The combination with an air-cooler, a cold-air shaft extended upward from said cooler, a secondary air-shaft parallel with the cold-air shaft, an air-firing apparatus at the lower ends of the shafts, and a valve in the throat of said apparatus to regulate the relative volumes of air passed therefrom to the two air-shafts, of a mixing-chamber between said shafts and having an outlet to the room or place to be ventilated, a flexible air-conducting tube connected to said outlet, a register at said outlet, a pressure-regulator connected to said register, registers at the inlets of the two shafts to the mixing-chamber, a thermostat, and mechanism for no-

testing the said registers from changes in the temperature of the room or place to be ventilated, substantially as described.

10. The combination with an air-cooler, a cold-air shaft extended upward from said cooler, a secondary shaft parallel with the cold-air shaft, an air-firing apparatus at the lower ends of said shafts, and an adjustable valve in the outlet-throat of the air-firing apparatus to regulate the relative volumes of air passed therefrom to the two shafts, of a mixing-chamber between the two shafts and having an outlet to the room or place to be ventilated, a register at said outlet, a pressure-regulator connected to said register, a flexible air-conducting tube connected to said outlet, registers at the inlets from the two air-shafts to the air-mixing chamber, a thermostat, and mechanism connecting the thermostat with said registers to simultaneously actuate the same from the varying temperature of the room or place to be ventilated, substantially as heretofore described and set forth.

699,853. APPARATUS FOR THE MANUFACTURE OF CARBON-DEUTERIDE HYDROGEN GAS. BENJAMIN VAN RENSSELAER, New York, N. Y. Filed Sept. 4, 1901. Serial No. 74,445. (No model.)

Claim.—1. In an apparatus for generating illuminating-gas, the combination comprising a generating-chamber, oil-condenser and electric incandescent burner, a connected steam-superheater and a connected electric steam or water decomposing chamber substantially as and for the purpose herein set forth.

2. In an apparatus for generating water-gas the combination of the generating-chamber, the firing-chamber, steam-decomposing chamber, the hydrocarbon oil and carbide and the generating-chamber provided with oil-condensers, the firing-chamber with carbon passages and both chambers provided with electric incandescent burners, substantially as and for the purpose herein set forth.

3. In an apparatus for generating gas the combination comprising the generating chamber, the firing-chamber the electric water or steam decomposing chamber; said generating and firing chamber provided with electric incandescent burners, and said decomposing-chamber provided to deliver free hydrogen into the generating-chamber, and provided to conduct the oxygen to a storage-holder substantially as and for the purpose herein set forth.

699,854. TYPE-WRITING MACHINE. FRANK Y. WAGNER, New York, N. Y., assignor to the Wagner Typewriter Company, New York, N. Y., a Corporation of New York. Filed Jan. 28, 1902. Serial No. 84,771. (No model.)

Claim.—1. In a type-writing machine, the combination of a carriage, a trackway carried by said carriage, a trackway carried by the framing of the machine, disconnected intermediate bearing-rollers between said trackways, and means on which the rollers are adapted to roll for maintaining

the rollers fixed one with relation to another throughout the movement of the carriage.

2. In a type-writing machine, the combination of a carriage, a trackway carried by said carriage, a trackway carried by the framing of the machine, disconnected intermediate bearing-rollers between said trackways, and rack and pinion for maintaining the rollers in fixed relation to the trackway on the framing of the machine throughout the movement of the carriage.

3. In a type-writing machine, the combination of a carriage, a trackway carried by said carriage, a trackway carried by the framing of the machine, disconnected intermediate bearing-rollers between said trackways, and rack and pinion for maintaining the rollers in fixed relation to the trackways throughout the movement of the carriage.

4. In a type-writing machine, the combination of a carriage, a trackway carried by said carriage, a trackway carried by the framing of the machine, disconnected intermediate bearing-rollers between said trackways, and rack and pinion for maintaining the rollers in fixed relation to the trackways throughout the movement of the carriage.

5. In a type-writing machine, the combination of a carriage, a trackway carried by said carriage, a rack carried by said trackway, a trackway carried by the framing of the machine, a rack carried by said second-named trackway, disconnected intermediate bearing-rollers between said trackways, and a gear connected to each of said rollers, each of which gears is adapted to engage the rack on the trackways.

6. In a type-writing machine, the combination of a carriage and geared roller-bearings upon which said carriage is supported.

7. In a type-writing machine, the combination of a carriage and disconnected uncoupled geared roller-bearings upon which said carriage is supported.

8. In a type-writing machine, the combination of a carriage, geared roller-bearings upon which said carriage is supported, and racks cooperating with said roller-bearings and carried by the carriage and the framing of the machine.

9. In a type-writing machine, the combination of a platen, a platen-carriage, means for moving the platen in a direction transverse to the length thereof for upper and lower case printing, a trackway carried by the carriage, a trackway carried by the framing of the machine, disconnected intermediate bearing-rollers between said trackways, and means on which the rollers are adapted to roll for maintaining the rollers fixed one with relation to another throughout the movement of the carriage.

10. In a type-writing machine, the combination of a platen, a platen-carriage, means for moving the platen in a direction transverse to the length thereof, a pivoted trackway carried by the carriage, a trackway carried by the framing of the machine, disconnected intermediate bearing-rollers between said trackways, and means for maintaining the rollers fixed one with relation to another.

11. In a type-writing machine, the combination of a platen, a platen-carriage, means for moving the platen in a direction transverse to the length thereof, a pivoted trackway carried by the carriage, a trackway carried by the framing of the machine, disconnected intermediate bearing-rollers between said trackways, and means for maintaining the rollers fixed one with relation to another and in fixed relation to the trackways.

12. In a type-writing machine, the combination of a carriage, a trackway carried by the carriage, a trackway carried by the framing of the machine, disconnected intermediate bearing-rollers between said trackways, means for maintaining the rollers fixed one with relation to another, a carriage fixed member carried by the carriage, and a cooperating carriage fixed member carried by the framing of the machine.

13. In a type-writing machine, the combination of a carriage, a trackway carried by said carriage, a rack carried by the trackway, a second trackway carried by the framing of the machine, a rack carried by said second-named trackway, intermediate flanged bearing-rollers between said trackways, and circular racks carried by each of the bearing-rollers intermediate of the flanges thereof, which circular racks mesh in the racks carried by the trackways.

14. In a type-writing machine, the combination of a carriage, a trackway pivoted to said carriage, a rack carried by the trackway, means for maintaining said trackway against lateral displacement but permitting a free longitudinal movement thereof with the carriage, a second trackway carried by the framing of the machine, a rack carried by said second-named trackway, intermediate flanged bearing-rollers between said trackways, and circular racks carried by each of the bearing-rollers intermediate of the flanges thereof, which circular racks mesh in the racks carried by the trackways.

15. In a type-writing machine, the combination of a carriage, a trackway connected to said carriage, which trackway is curved in connection, a rack on the trackway, a second trackway on the framing of the machine, a rack on said second-named trackway, disconnected bearing-rollers which cooperate with the trackways and with the racks thereon, and pivotal connections for maintaining the carriage-trackway in operative position, whereby said carriage-trackway can turn with the carriage as well as move longitudinally therewith.

699,855. BLUE-PRINTING APPARATUS. SAMUEL R. WHITNEY, Pittsburg, Pa., assignor to the Pittsburg Blue Print Company, a Corporation of Pennsylvania. Filed Jan. 21, 1902. Serial No. 90,962. (No model.)

Claim.—1. A transparent hollow printing-frame, a cover therefor provided with one or more catches, each having two members composed of spring material, one secured to the cover and the other forming a clasp.

2. A transparent hollow printing-frame, a cover therefor provided with one or more catches, each having spring members secured together at their ends, the intermediate portions supporting the cover and the printing part of the catch.

699,856. COUPLERS FOR SHIPS PROPELLER-SHAFTS. WILLIAM W. WHITE, New York, N. Y., assignor to John Verity, deceased. Filed Feb. 24, 1902. Serial No. 90,961. (No model.)

Claim.—1. In a multiple-propeller ship's shafting, the combination of the engine crank-shaft *A*; the thrust-ring length *B* next same, having at each end an ordinary coupling-flange *a*, and a flexible device *y* in said

length between said flanges; a tail-shaft *c* at the stern end of which the propeller is fastened, having an ordinary coupling-flange *s* at its forward end, and a flexible device *y* between this flange and the stern end; and a plurality of lengths *e* between the shafts *a* and *b*, each length having ordinary coupling-flanges *a* at their ends; substantially as set forth.

2. In a ship's propeller-shaft comprising a plurality of lengths, a length of shafting having a coupling-flange *a* at each end, and between these ends a flexible device consisting of a flange *i* on one part of the shaft with projections *j* on its inner face, a flange *i'* on the other part having projections *j'* on its inner face adapted to fit in the spaces between the projections *j* of the other flange; oppositely-disposed bearing-heads *x*, with shoulders *x'* fitting in and supported in the ends of said shaft, and inwardly-tapering bearing-faces; keys *p* fitting between two of the adjacent faces or edges of the projecting parts *j*, wedges *q* disposed between the other adjacent edges of said parts *j*, a wedge-holding cam-ring *r* fitting over the flange *i'*, having cam-ribs *t* in which the ends of the wedges *q* work, a projecting annular flange or ring *k* on the flange *i'*, and a ring *v* fitting outside and on the ring *k*, and supporting the inner ends of the keys *p*, and a plurality of bolts *u* and springs *e*, said bolts passing through said flange *i* and parts *j*; substantially as set forth.

3. In a ship's propeller-shaft comprising a plurality of lengths, a length of shafting having a coupling-flange *a* at each end, and between these ends a flexible device consisting of a flange *i* on one part of the shaft with projections *j* on its inner face, a flange *i'* on the other part having projections *j'* on its inner face, adapted to fit in the spaces between the projections *j* of the other flange, oppositely-disposed bearing-heads *x*, with shoulders *x'* fitting in and supported in the ends of said shaft, and inwardly-tapering bearing-faces; keys *p* fitting between two of the adjacent faces or edges of the projecting parts *j*, wedges *q* disposed between the other adjacent edges of said parts *j*, a wedge-holding cam-ring *r* fitting over the flange *i'*, having cam-ribs *t* in which the ends of the wedges *q* work, a projecting annular flange or ring *k* on the flange *i'*, and a ring *v* fitting outside and on the ring *k*, and supporting the inner ends of the keys *p*, and a plurality of bolts *u* and springs *e*, said bolts passing through said flange *i* and parts *j*; substantially as set forth.

699,857. CARBURIZER. JOSEPH WILKINSON, Burton-in-Lonsdale, and EDWARD F. CHAPMAN and HARRY THOMPSON, Leeds, England. Filed Jan. 21, 1902. Serial No. 90,963. (No model.)

Claim.—1. In apparatus for producing mixtures of vaporized oil and air, a carburizer consisting of a cylinder provided with closed ends and apertures for admission of air and of oil, and for the exit of the gaseous mixture as described, a deflecting-plate fixed to the interior of the air-admission end of said cylinder, an arch constructed as described and composed of absorbent material arranged between layers of gauze, and provided with end pieces similarly constructed, said arch being made to fit portions of the interior of said cylinder, and at other portions to leave spaces for the oil and gas, the air-admission pipe provided with an air-collecting chamber in communication with one end of the cylinder, an exit-pipe at the opposite end of the cylinder and in communication with the gas-space, an oil-supply pipe at a suitable distance from the air-admission end of the cylinder, an oil-distributing plate fixed to the interior of the cylinder under the said oil-pipe, a closed oil-supply tank placed above the carburizer and provided with an oil-admission aperture, a pipe provided with a stop-cock connecting the bottom of said tank with gas-space in said carburizer and a pressure-pipe for connecting the said gas-space with the top of said tank, substantially as set forth.

2. In apparatus for producing mixtures of vaporized oil and air, a carburizer consisting of a cylinder provided with closed ends and apertures for admission of air and of oil, and for the exit of the gaseous mixture as described, a deflecting-plate fixed to the interior of the air-admission end of said cylinder, an arch constructed as described and composed of absorbent material arranged between layers of gauze, and provided with end pieces similarly constructed, said arch being made to fit portions of the interior of said cylinder, and at other portions to leave spaces for the oil and gas, the air-admission pipe provided with an air-collecting chamber in communication with one end of the cylinder, an exit-pipe at the opposite end of the cylinder and in communication with the gas-space, an oil-supply pipe at a suitable distance from the air-admission end of the cylinder, an oil-distributing plate fixed to the interior of the cylinder under the said oil-pipe, a fan for causing a current of air to pass through the carburizer, a gas-jet for heating the air as it passes to the carburizer, tanks for receiving and mixing the oils, and pipes provided with valves for connecting the tanks with each other and with the carburizer, all in combination and substantially as described and illustrated herein.

3. In apparatus for producing mixtures of vaporized oil and air the combination with a carburizer of a closed oil-supply tank placed above the carburizer and provided with an oil-admission aperture, a pipe provided with a stop-cock connecting the bottom of said tank with gas-space in said carburizer, a pressure-pipe for connecting the said gas-space with the top of said tank, a smaller closed tank fixed to the top of the oil-supply tank, a pipe connecting the two tanks together, valves as described within the smaller tank and connected together by a rod, levers for supporting said rod in position and pipes provided with stop-cocks for connecting the top of the smaller tank respectively with said gas-space, and with the base of the carburizer at its gas-exit end, all as set forth.

4. In apparatus for producing mixtures of vaporized oil and air, a carburizer consisting of a cylinder provided with closed ends and apertures as described, a deflecting-plate fixed to the interior of the air-admission end of said cylinder, an arch constructed as described and composed of absorbent material arranged between layers of gauze, and provided with end pieces similarly constructed, said arch being made to fit portions of the interior of said cylinder, and at other portions to leave spaces for the oil and gas, the air-admission pipe provided with an air-collecting chamber in communication with one end of the cylinder, an exit-pipe at the opposite end of the cylinder and in communication with the gas-space, an oil-supply pipe at a suitable distance from the air-admission end of the cylinder, an oil-distributing plate fixed to the interior of the cylinder under the said oil-pipe, a closed oil-supply tank placed above the carburizer and provided with an oil-admission aperture, a pipe provided with a stop-cock connecting the bottom of said tank with gas-space in said carburizer and a pressure-pipe for connecting the said gas-space with the top of said tank, substantially as set forth.

5. In apparatus for producing mixtures of vaporized oil and air, a carburizer consisting of a cylinder provided with closed ends and apertures for admission of air and of oil, and for the exit of the gaseous mixture as described, a deflecting-plate fixed to the interior of the air-admission end of said cylinder, an arch constructed as described and composed of absorbent material arranged between layers of gauze, and provided with end pieces similarly constructed, said arch being made to fit portions of the interior of said cylinder, and at other portions to leave spaces for the oil and gas, the air-admission pipe provided with an air-collecting chamber in communication with one end of the cylinder, an exit-pipe at the opposite end of the cylinder and in communication with the gas-space, an oil-supply pipe at a suitable distance from the air-admission end of the cylinder, an oil-distributing plate fixed to the interior of the cylinder under the said oil-pipe, a closed oil-supply tank placed above the carburizer and provided with an oil-admission aperture, a pipe provided with a stop-cock connecting the bottom of said tank with gas-space in said carburizer, a pressure-pipe for connecting the said gas-space with the top of said tank,

a smaller closed tank fixed to the top of the oil-supply tank a pipe connecting the two tanks together, valves as described within the smaller tank and connected together by a rod, bearings for supporting said rod in position and pipes provided with stop-cocks for connecting the top of the smaller tank respectively with said gas-space, and with the base of the carburetor at its gas-exit end, all as set forth.

699,858. FITMAN. GEORGE WILSON, Rockford, Ill., assignor to Emerson Manufacturing Company, Rockford, Ill. Filed Aug. 21, 1901. Serial No. 74,083. (No model.)

Claim.—1. In a fitman, the combination of a pitman-head fitted to receive a wrist-pin of a crank-head, a projection extending at right angles from the pitman-head, a cap secured in connection with the projection, the projection and cap having their meeting faces provided with semispherical recesses and a pitman-rod having a ball at one end and located in the recesses.

2. In a fitman, the combination of a pitman-head fitted to receive a wrist-pin of a crank-head, a projection extending at right angles from the pitman-head, a cap secured in connection with the projection, the projection and cap having their meeting faces provided with semispherical recesses and a pitman-rod having a ball at one end and located in the recesses, the free ends of the projection and cap forming an elongated opening for the movement of the pitman-rod.

699,859. CORSET-FASTENER. JOHN H. WALKER, Concord, Mich. Filed Sept. 12, 1901. Serial No. 73,904. (No model.)

Claim.—1. In a corset-fastener, the combination of the two bux, one having a continuous longitudinal shoulder, *B*, and the parts of the bux at the opposite sides of the shoulder lying in different planes, and one of said parts having hooks integral therewith bent toward and opposing said shoulder, and the other bux having apertures near its edge to receive said hooks, whereby it will lie with said edge against and lapping over the nearer part of the former bux, opposite said shoulder, and in substantially the same plane with the further part of the other bux.

2. In a corset-fastener, the combination of the two bux, one having a continuous longitudinal shoulder, *B*, and the parts of the bux at the opposite sides of the shoulder lying in different planes, and one of said parts having hooks integral therewith formed within the edge of the bux bent toward and opposing said shoulder, and the other bux having apertures near its edge to receive said hooks, whereby it will lie with said edge against and lapping over the nearer part of the former bux opposite said shoulder and in substantially the same plane with the further part of the former bux, substantially as set forth.

3. A fastening device for a corset, consisting of a bux having a series of apertures, and an opposite bux having the portions *A*, *B* offset or in different planes forming the shoulder *B*, the part *B* extending continuously in one plane from the side edges of the bux; and the portions *B* of the part *B* between the hooks lying in one plane from the edge *B* to said shoulder *B*, substantially as set forth.

699,860. KNOTTER ATTACHMENT FOR HARVESTERS. DAVID L. WOLF, Archer City, Tex. Filed Aug. 17, 1901. Serial No. 73,499. (No model.)

Claim.—In an attachment for the frame of a harvester for a harvester, the combination with the frame *A*, having two longitudinal apertures therein, and provided with a curved projecting portion *A'* at one end thereof, of the shouldered knotted-chalk journaled in one of said apertures, a wear-block *K* having a shank portion *J* passing through the other aperture in said frame, said block having two flat faces disposed at an angle to each other, and adapted to contact with the wall of the shouldered portion, and a curved edge on the block designed to be flush with the surface of the projecting portion *A'*, as set forth.

699,861. ROTARY COLOR-PRINTING MACHINE. WILLIAM F. WILKINSON, Highbury, England. Filed Nov. 12, 1901. Serial No. 82,948. (No model.)

Claim.—1. In a device of the character described, a track, a frame movable on the track, checks suspended from the frame, printing-rollers carried by the checks, and a drum journaled in the checks coacting with the printing-rollers whereby material carried by the drum will be printed upon by the printing-rollers.

2. In a device of the character described, a frame mounted on elevated supports, checks suspended from the sides of the frame and hanging clear of the floor, printing-rollers carried by the checks around their lower parts, and a drum journaled in the checks coacting with the printing-rollers whereby material carried by the drum will be printed upon by the printing-rollers.

3. In a device of the character described, an elevated track, a frame having wheels bearing on the track, checks suspended from the sides of the frame and hanging clear of the floor, printing-rollers carried by the checks on their lower parts, a drum journaled in the checks coacting with the printing-rollers whereby material carried by the drum will be printed upon by the printing-rollers, and means for traversing the frame on the track.

699,862. MARKING-TAG. LEWIS T. ANDER, St. Louis, Mo. Filed May 17, 1901. Serial No. 69,047. (No model.)

Claim.—1. A marking-tag comprising a pair of flat plates, rivets extending transversely of the same pivotally connecting said plates, a wedge-bar pivoted at one end to one of said plates at the corner of the latter the said bar being mounted on a pin independent of said rivets, substantially as described.

2. A marking-tag comprising a pair of flat rectangular plates, rivets pivotally connecting said plates together, a wedge-bar pivoted to one of said plates at the corner thereof, said bar being interposed between said plates and being adapted to occupy a position substantially within the border of the plates when in turned-down wedging position, substantially as described.

699,868. OPERATING DEVICE FOR ELEVATOR-DOORS. HARRY BRINK, Durvya, Ill., assignor to the Winslow Elev. Co., Chicago, Ill., a Corporation of Illinois. Filed Sept. 20, 1900. Serial No. 59,578. (No model.)

Claim.—1. The combination with a horizontally-reciprocable door, of a vertically-reciprocable rod, a pair of pulleys respectively upon opposite sides of said rod, a flexible connection secured to one side of the door passing around one of said pulleys along said rod in one direction and having a limited sliding engagement therewith, a flexible connection secured to the other side of the door passing over the other pulley and having means of temporary engagement with the rod, means for reciprocating the rod and means for effecting such temporary engagement; substantially as described.

2. The combination with a horizontally-reciprocable door, a vertically-reciprocable rod, and pulleys upon opposite sides thereof, of flexible connections secured to the opposite edges of the door extending over the respective pulleys and along said rod in opposite directions, slides secured to said connections and guided on the rod, a block secured to said rod and adapted to engage one of said slides in the direction which closes the door, a block secured to said rod adjacent to the other slide and a device for effecting engagement between the latter slide and the adjacent block and thereby open the door; substantially as described.

3. The combination with a horizontally-reciprocable door, of a vertical reciprocable rod, pulleys journaled adjacent to said rod, cables leading from the opposite edges of the door, around the pulleys in opposite directions, slides secured upon the ends of said cables and sliding upon the rod, blocks secured upon the rod, one of which is adapted, when the rod is moving in one direction, to draw the adjacent slide with it, a spring-pressed hook upon the other slide adapted to hook upon the adjacent block, means for reciprocating the rod and means for throwing the hook into or out of engagement with the block; substantially as described.

4. The combination with a horizontally-reciprocable door, of a vertically-reciprocable rod/pulleys adjacent to the rod, cables extending from the opposite edges of the door around the pulleys in opposite directions, slides secured to said cables and guided upon the rod, a block upon the rod adapted to engage one of the slides to move the door in one direction, a block secured to the rod adjacent to the other slide and adapted to be temporarily connected with the adjacent slide to move the door in the opposite direction, devices for reciprocating the rod and an operating-lever adapted to effect the engagement of said block and slide and to start the device for reciprocating the rod; substantially as described.

5. The combination with a horizontally-reciprocable door, of a vertically-reciprocable rod, pulleys adjacent thereto, cables extending from the opposite edges of the door around the pulleys in opposite directions, slides secured to said cables and guided upon the rod, a block secured upon the rod adjacent to one of the slides and adapted to engage said slide in the movement of the rod in one direction to move the door in one direction, a block secured upon the rod adjacent to the other slide, a spring-pressed hook pivoted upon the latter slide adapted to hook upon the adjacent block, a lever adapted, when in one position, to hold the hook out of engagement with the block to permit the rod to be reciprocated without affecting the movement of the door, and a motor for reciprocating the rod connected to said lever, whereby the movement of said lever into a second position permits of the connection between the hook and block and starts the motor; substantially as described.

6. The combination with a horizontally-reciprocable door, of a vertically-reciprocable rod, pulleys adjacent thereto, cables extending from the opposite edges of the door around the pulleys in opposite directions, slides secured to said cables and guided upon the rod, a block secured upon the rod adjacent to one of the slides and adapted to engage said slide in the movement of the rod in one direction to move the door in one direction, a block secured upon the rod adjacent to the other slide, a spring-pressed hook pivoted upon the latter slide and adapted to hook upon the adjacent block, a lever adapted, when in one position, to hold the hook out of engagement with the block to permit the rod to be reciprocated without affecting the movement of the door and a motor for reciprocating the rod connected to said lever, whereby the movement of the lever into a second position allows the spring-hook to engage the block and starts the motor to move the rod in one direction and the return of the lever to the first position starts the motor in the opposite direction; substantially as described.

7. The combination with a horizontally-reciprocable door, of a vertically-reciprocable rod, pulleys adjacent thereto, cables extending from the opposite edges of the door around the pulleys in opposite directions, slides secured to said cables and guided upon the rod, a block secured upon the rod adjacent to one of the slides and adapted to engage said slide in the movement of the rod in one direction to move the door in one direction, a block secured upon the rod adjacent to the other slide, a spring-pressed hook pivoted upon the latter slide and adapted to hook upon the adjacent block, and a lever, lying in the path of the hook and adapted to crowd the same out of engagement with the block, when said hook is moved upon the lever; substantially as described.

699,864. TROLLEY-STAND. CHARLES C. BROADBENT, Detroit, Mich. Filed Aug. 14, 1901. Serial No. 72,047. (No model.)

Claim.—1. In combination with a trolley-stand, a relative support and a housing including and covering said relative support, substantially as described.

2. In a trolley-stand, in combination with a housing arranged to be attached to the car-roof, a support within said housing arranged to rotate

therein, a trolley-socket arranged to be secured to the support and means for drawing the housing substantially as described.

3. In combination with a base arranged to be attached to a car-roof provided with a track for a rotary support, an upper track arranged to be secured to the fixed base, a cover adapted to inclose the upper side of the housing thus made, and a packing held in position relatively fixed to the fixed parts of the housing and adapted to coast with the rotary part of the housing to form a complete closure, substantially as described.

4. In a trolley-support, the combination of a fixed part provided with a circular hardened track and having a base portion and covering-ring adapted to engage the base portion with a close-packed joint, a rotative cover arranged to be placed over the cover-ring, an interposed packing, a rotary support provided with wheels arranged to travel on the hardened track and means for securing the trolley-stand to the rotary support through the interposed packing, substantially as described.

5. In a trolley-support, in combination with a housing provided with a hardened track on its outer side and a hardened track on its covered side, a rotary support arranged in the housing and provided with running wheels adapted to engage the said hardened track, substantially as described.

6. In combination with a trolley-stand, a rotative support, a housing inclosing and covering said rotative support and means for securing electric wires to said housing, substantially as described.

699,865. SHIRT. DAVID L. BLOK, New York, N. Y., assignor of one-half to Jacob Lederer, New York, N. Y. Filed Feb. 26, 1908. Serial No. 94,982. (No model.)

Claim.—1. A shirt provided with a transverse slit for the passage of a suspender-strap, and with a binding that overlaps the upper edge of the slit and extends downward over the slit, substantially as specified.

2. A shirt provided with transverse slits at the front and back for the passage of the suspender-strap, and with a continuous binding around the slits that is turned downward to form a flap over the slits, substantially as specified.

699,866. ROBE-COUPLES. JOHN J. BOWEN, JR., FARMERS, Pa. Filed Nov. 3, 1901. Serial No. 81,787. (No model.)

Claim.—1. A coupling, comprising a female section having an enlarged head, provided with recesses and inwardly-projecting flanges, a male section provided with lugs and a shoulder having cockets, a locking-ring slidably mounted on said cockets and having extensions to engage said recesses, springs in said cockets to hold said ring normally projected, and a U-shaped washer carried in said head.

2. A coupling, comprising a female section having an enlarged annular head provided with segmental flanges and recesses, a male section provided with segmental lugs and a shoulder having cockets, a locking-ring having forwardly-extending lugs to engage said recesses, springs interposed in said cockets to keep said ring normally projected, and an annular U-shaped washer carried in said head, and the flanges of which rest against the inner wall of the head and the outer surface of the male section.

3. A coupling, comprising a female section, provided at diametrically opposite points with inwardly-projecting segmental flanges and intermediate said flanges with recesses, a pocket within said head, a male section provided with segmental lugs, and an annular shoulder having cockets, a locking-ring having forwardly-extending lugs to engage said recesses and slidably mounted upon said shoulder, lugs upon said ring extending into said cockets, permitting the ring to have a limited longitudinal movement on said shoulder, springs in said cockets and secured to said lugs keeping the ring normally projected, and an annular U-shaped washer carried in said pocket, and the flanges of which rest against the inner wall of the head and the outer surface of the male section.

699,867. BOTTLE-WASHING MACHINE. EMERY & BROWNE, Baltimore, Md., assignors of one-half to William F. Sahn, Baltimore, Md. Filed Sept. 5, 1901. Serial No. 74,348. (No model.)

Claim.—1. In a bottle-washing machine, the combination with rotary spindles of a cradle or bottle-holder, gearing for revolving the spindles, vertical shafts each formed with crossed threads, and nuts at opposite sides of the cradle or bottle-holder through which said shafts extend whereby the bottle-holder is raised and lowered.

2. The combination with a water-box having a horizontal partition and revolvable hollow spindles of a vertically-movable cradle or bottle-holder and means for raising and lowering the cradle comprising revolvable vertical shafts each formed with crossed threads, and nuts secured to opposite sides of the cradle through which said shafts extend.

3. In a bottle-washing machine, the combination with revolving spindles, and a water-box divided by a horizontal partition, of a device for supporting the bottles above the spindles comprising a vertically-movable cradle or holder provided with yielding supports for the mouth ends of the bottles, and a cover provided on its inner surface with pads to fit upon the bottoms of the bottles.

4. In a bottle-washing machine, the combination with the revolvable hollow spindles of a cradle or bottle-holder, means for raising and lowering the same, and a cover for the holder, provided with opening-springs and a spring-latch.

5. In a bottle-washing machine, the combination with a supporting-frame, of a water-box divided into supply and discharge compartments, hollow spindles revolvably supported within said box a cradle or bottle-holder, means for raising and lowering said cradle, and means for automatically controlling the water-supply to the spindles.

699,868. SANDING AND POLISHING MACHINE. EDWARD T. CLEMON, Hornellsville, N. Y., assignor of one-half to George Osterman, Hornellsville, N. Y. Filed Sept. 2, 1901. Serial No. 74,788. (No model.)

Claim.—1. In a machine of the character described, the combination with a supporting-frame, of tracks mounted on said supporting-frame, a carriage freely movable on said tracks transversely of the machine, a work-table mounted on said carriage and movable independently thereof transversely of the machine, and finishing instrumentalities mounted above said table.

2. In a machine of the character described, the combination with a supporting-frame, of tracks mounted on said supporting-frame a carriage freely movable on said tracks transversely of the machine, a work-table mounted on said carriage and movable independently thereof transversely of the machine, means for moving said work-table vertically relative to said tracks, and finishing instrumentalities mounted above said table.

3. In a machine of the character described, the combination with a suitable supporting-frame, of transversely-placed supporting-tracks adjustably mounted on said frame, a carriage freely movable on said tracks

transversely of the machine, a table-supporting frame mounted on said carriage and movable independently thereof transversely of the machine, a work-table carried by said supporting-frame, means for moving said table vertically relative to said supporting-frame, and finishing instrumentalities mounted above said table.

4. In a machine of the character described, the combination with a suitable supporting-frame, of transversely-placed tracks adjustably mounted on said frame, said tracks being provided with steps at their outer ends, a carriage freely movable on said tracks, a table-supporting frame mounted on said carriage and movable independently thereof, said supporting-frame having downwardly-turned steps at its ends, a work-table mounted on said supporting-frame, means for moving said table vertically relative to said supporting-frame, and finishing instrumentalities mounted above said table.

5. In a machine of the character described, the combination with a suitable supporting-frame, of transversely-placed tracks adjustably mounted on said frame, a carriage mounted on said tracks and freely movable thereon transversely of the machine, said carriage being provided with wheels having grooved outer extensions, a table-supporting frame mounted on said carriage and movable transversely of the machine independently of the said carriage, rock-shafts mounted in said table-supporting frame, links carried by said rock-shafts, a work-table mounted on said links, means for moving said table vertically relative to its supporting-frame, and finishing instrumentalities mounted above said table.

6. In a machine of the character described, the combination with a suitable supporting-frame, of transverse supporting-tracks adjustably mounted on said frame, a carriage mounted on said tracks and freely movable thereon, a table-supporting frame mounted on said carriage and movable transversely of the machine independently thereof, rock-shafts mounted in said table-supporting frame, links carried by said rock-shafts, a work-table supported by said links, a hand-lever secured to one of said rock-shafts by which said shaft may be rocked and the said work-table moved vertically, a weighted lever secured to one of said rock-shafts to counter-balance the weight of the table, and finishing instrumentalities mounted above said table.

7. In a machine of the character described, the combination with a supporting-frame, of transverse tracks mounted on said frame, a work-table movable transversely of the machine on said tracks, means for moving said table vertically, a finishing-belt mounted above said table, a belt-guide beneath which said finishing-belt travels, and means for supporting said belt-guide so as to permit it to yield longitudinally and transversely; whereby the said finishing-belt may accommodate itself to inequalities in the surface of the work.

8. In a machine of the character described, the combination with a supporting-frame, of transverse tracks mounted on said frame, a work-table mounted on said tracks and freely movable transversely of the machine, means for raising said work-table vertically, a finishing-belt adapted to travel above said work-table, a belt-guide adjustably supported above said belt, springs normally flexing said belt-guide downwardly and permitting it to yield longitudinally, and connections between said belt-guide and its supports, whereby the said guide can rock transversely and allow

the finishing-belt to accommodate itself to inequalities in the surface of the work.

9. In a machine of the character described, the combination with a supporting-frame, of transversely-placed tracks adjustably mounted on said frame, a work-table supported by and freely movable on said tracks, means to move said table vertically, a continuous finishing-belt adapted to travel above said table, a belt-guide against the under surface of which said finishing-belt travels, and adjustment devices at each end of said belt-guide over which the finishing-belt runs.

10. In a machine of the character described, the combination with a supporting-frame, of a work-table movable transversely of said frame, means for raising said work-table vertically, a finishing-belt mounted above said work-table, a yielding belt-guide against the under surface of which said belt travels, and yielding-mounted adjustment-rollers at each end of said belt-guide over which the said finishing-belt runs.

11. In a machine of the character described, the combination with a supporting-frame, of a work-table, a finishing-belt, a belt-guide against the under surface of which said finishing-belt travels, and between which said belt and the work is held, and means for depressing the finishing-belt below its normal line of travel at each end of said belt-guide; whereby a curved or rounded edge may be finished.

12. In a machine of the character described, the combination with a supporting-frame, of a work-table mounted thereon, means for moving said table transversely of the machine, means for raising said work-table vertically, a finishing-belt mounted above said table, a belt-guide against the under surface of which said finishing-belt travels, adjustment-rollers at each end of said belt-guide over which the said finishing-belt runs, and means for vertically adjusting said rollers.

13. In a machine of the character described, the combination with a supporting-frame, of a work-table mounted thereon, means for moving said table transversely of the machine, means for raising said work-table vertically, a finishing-belt mounted above said table, a belt-guide against the under surface of which said finishing-belt travels, adjustment-rollers at each end of said belt-guide over which the said finishing-belt runs, and means for lowering said adjustment-rollers and depressing the said belt at the ends of the belt-guide below its line of travel whereby a curved or rounded edge may be finished.

14. In a machine of the character described, the combination with a main supporting-frame, of transversely-placed tracks adjustably mounted on said frame, a work-table movable on said tracks, means for moving said work-table vertically, a finishing-belt adapted to travel above said table, an adjustable support mounted on said main supporting-frame above said belt, a yielding belt-guide carried by said adjustable support against the under surface of which said finishing-belt runs, plates secured to said adjustable supporting-frame at each end of said belt-guide, and adjustable lengthwise thereon, and adjustment-rollers supported by said adjustable plates over which said finishing-belt runs.

15. In a machine of the character described, the combination with a main supporting-frame, of transversely-placed tracks adjustably mounted on said frame, a work-table movable on said tracks, means for moving said work-table vertically, a finishing-belt adapted to travel above said table, an adjustable supporting-frame mounted on said main frame above said belt, a yielding belt-guide carried by said adjustable frame against the under surface of which said finishing-belt runs, plates secured to said adjustable supporting-frame at each end of said belt-guide, and adjustable lengthwise thereon, and adjustment-rollers supported by said adjustable plates over which said finishing-belt runs.

16. In a machine of the character described, the combination with a supporting-frame, of a work-table movable transversely of the machine, means for raising said work-table vertically, a finishing-belt mounted to travel above said table, a belt-guide against the under surface of which said belt runs, a supporting-frame for said guide, supporting-rolls for said guide depending from said frame, and yielding connections between said rolls and guide whereby a rocking movement of said belt-guide is permitted.

17. In a machine of the character described, the combination with a supporting-frame, of a work-table movable transversely of the machine, means for raising said work-table vertically, a finishing-belt mounted to travel above said table, a belt-guide against the under surface of which said belt runs, a supporting-frame for said guide, supporting-rolls for said guide depending from said frame, and spring-plates on said guide to engage said supporting-rolls whereby a rocking movement of said belt-guide is permitted.

18. In a machine of the character described, the combination with a supporting-frame, of a work-table mounted thereon and movable transversely of the machine, means for moving said work-table vertically, a finishing-belt mounted to travel above said table, a belt-guide against the under surface of which said belt runs, an adjustable supporting-frame for said belt-guide, supporting-rolls depending from said frame, yielding connections between said rolls and said belt-guide whereby a transverse rocking movement of said belt-guide is permitted, springs surrounding said

rod and normally forcing said belt-guide downwardly, and means for adjusting the tension of said springs.

19. In a machine of the character described, the combination with a supporting-frame, of a work-table mounted thereon and movable transversely of the machine, means for moving said work-table vertically, a spring-pressed, transversely-yielding belt-guide adjustably mounted above said table, a finishing-belt adapted to travel beneath said belt-guide, a driving-pulley at one end of the machine over which said belt travels, a rocking frame mounted at the other end of the machine, and an idler-pulley carried by said rocking frame over which said finishing-belt travels.

20. In a machine of the character described, the combination with a supporting-frame, of a work-table mounted thereon and movable transversely of the machine, means for moving said work-table vertically, a spring-pressed, transversely-yielding belt-guide adjustably mounted above said table, a finishing-belt adapted to travel beneath said belt-guide, a driving-pulley at one end of the machine over which said belt travels, a rocking frame mounted at the other end of the machine, an idler-pulley carried by said rocking frame over which said finishing-belt travels, and means to throw said rocking frame to its outer position and maintain a uniform tension on said finishing-belt.

21. In a machine of the character described, the combination with a supporting-frame, of a work-table mounted thereon and movable transversely of the machine, means for moving said work-table vertically, a spring-pressed, transversely-yielding belt-guide adjustably mounted above said table, a finishing-belt adapted to travel beneath said belt-guide, a driving-pulley adjustably mounted at one end of the machine over which said belt travels, a rocking frame adjustably mounted at the other end of the machine, an idler-pulley carried by said rocking frame over which said finishing-belt travels, and means to throw said rocking frame to its outer position and maintain a uniform tension on said finishing-belt.

22. In a machine of the character described, the combination with a main supporting-frame, of a work-table adjustably mounted on said frame and movable transversely thereof, means for moving said table vertically relative to its adjustable supports, a belt-guide adjustably mounted above said table, a continuous finishing-belt adapted to run against the under surface of said belt-guide, supporting-pulleys over which said belt runs, means for driving said pulleys and belt, and a hopper containing a finishing compound beneath which the upper run of said belt travels and from which it receives a coating of polishing or finishing material.

23. In a machine of the character described, the combination with a main supporting-frame, of a work-table adjustably mounted on said frame and movable transversely thereof, means for moving said table vertically relative to its adjustable supports, a belt-guide adjustably mounted above said table, a continuous finishing-belt adapted to run against the under surface of said belt-guide, supporting-pulleys over which said belt runs, means for driving said pulleys and belt, a hopper arranged above the upper run of the said finishing-belt and adapted to deliver a finishing compound to the surface of said belt, and a liquid-feed pipe above the said upper run of the belt in proximity to said hopper.

699,869. PADLOCK. JAMES H. O'NEIL, Chicago, Ill. Filed Feb. 28, 1901. Serial No. 46,712. (No model.)

Claim.—1. A padlock comprising a shackle locking mechanism enclosed by a suitable casing, and a shackle arranged directly back of said casing, said shackle having forwardly and upwardly projecting lower and portions to which the said casing and locking mechanism are applied, substantially as described.

2. A padlock comprising a shackle, locking mechanism engaging said shackle, a casing including said locking mechanism, the said shackle being formed with upward lower and portions adapted to extend through openings or sockets in the bottom of the casing, and the said locking mechanism including a dog and a plurality of tumblers, the dog engaging the shackle and the said tumblers engaging the said dog, the dog and tumblers being rotatable in one and the same direction for the purpose of disengaging the dog from the shackle, or so to unlock the padlock, and the

said dog and tumblers being both rotatable in an opposite direction for the purpose of allowing the dog to engage the shackle, or so to lock the padlock, substantially as described.

699,870. TAG OR CHECK. WILLIAM F. CUNNING, New York, N.Y. Filed Oct. 11, 1901. Serial No. 71,266. (No model.)

Claim.—A combination delivery receipt-tag, composed of three parts, each part a means of identifying the article, constructed and adapted for one part to be attached to the article, a second given to the holder of the article by the person to whom the delivery is to be made, and the third to be given to the holder of the article after the article has been delivered.

699,871. EYELET-HOLE-SEWING MACHINE. CHARLES A. DARR, Lynn, Mass., assignor to Boston Buttonhole Sewing Machine Company, Boston, Mass., a Corporation of Maine. Filed May 21, 1901. Serial No. 68,598. (No model.)

Claim.—1. A sewing machine of the character indicated, comprising a bed-frame, a work-clamping member, an eye-pointed, reciprocating, straight needle located above the clamping member, an eye-pointed, reciprocating curved needle located below the work-clamping member, means to rotate the needle in making the stitches comprising the needle-carrying members 13 and 17, the part H, having toothed formations and cam-groove 25, and connections substantially as described, with the needle-carrying members 13, 17, and means to partially rotate the part H, step by step, whereby the needles are rotated a full revolution during the stitching operation, combined with a separately-actuated part, as H, having toothed formations adapted for engagement with the toothed formations of the part H, for completing the rotation of part H, whereby the needles are reversely rotated to the starting-point, substantially as described.

2. An overedge sewing-machine, comprising a clamp-frame, a work-clamp mounted thereon, a stitch-former, stitch-forming mechanism mounted thereon, and means for operating it, said stitch-forming mechanism being capable of bodily rotation in said stitch-former, a cam member, and connections between said cam member and the stitch-forming mechanism whereby upon a single rotation of said cam member the stitch-forming mechanism is bodily rotated in one direction and then bodily rotated in the reverse direction, means for giving a step-by-step movement to said cam member to an extent sufficient to give the desired rotation to the stitch-forming mechanism and a second means for continuing said move-

ment of said cam member in an extent sufficient to give the desired reverse rotation to the stitch-forming mechanism.

3. A buttonhole-sewing machine comprising stitch-forming mechanism capable of bodily rotation, three shafts, a driven pulley loosely mounted on the first of said shafts and connected with the manual of said shafts to rotate the same, a clutch between the pulley and the first shaft, means for intermittently rotating the third shaft from the first shaft, connections between the third shaft and the stitch-forming mechanism whereby the latter may be rotated in either direction, a device loosely-mounted on the second shaft and having periodic engagement with the third shaft to operate the same at times, a clutch between said device and the second shaft, connections between the first shaft and the stitch-forming mechanism for operating the same to form stitches, means for actuating the second of said shafts when the machine is set in operation.

4. A buttonhole-sewing machine, comprising stitch-forming mechanism capable of bodily rotation, three shafts, a pulley loosely mounted on the first shaft, a clutch between said pulley and said shaft, connections between the first and second shafts whereby the latter may be driven by the former, a cam mounted on the third shaft and connected with the stitch-forming mechanism to rotate the same, means for giving a continuous rotation to the third shaft from the second shaft at times, means for giving an intermittent rotation to the third shaft from the first shaft at other times whereby intermittent movement may be given to the stitch-forming mechanism in one direction and a continuous movement may be given to the stitch-forming mechanism in the opposite direction.

5. A buttonhole-sewing machine, comprising a rectilinearly-reciprocating needle, and means for operating it, lower complementary stitch-forming mechanism comprising a curved needle pivoted at an oblique angle to the path of reciprocation of the needle upon a rotary support, the said rotary support, means for rotating said support, and means for operating the curved needle.

6. A buttonhole-sewing machine, comprising a rectilinearly-reciprocating needle, and means for operating it, lower complementary stitch-forming mechanism, comprising a curved needle pivoted at an oblique angle to the path of reciprocation of the needle upon a rotary support, the said rotary support, means for rotating said support, and means for giving a variable movement to the said curved needle.

7. A buttonhole-sewing machine comprising a rectilinearly-reciprocating needle, and means for operating it, lower complementary stitch-forming mechanism comprising a thread-carrier mounted upon a shaft, said shaft being arranged at an oblique angle to a path of reciprocation of the needle, a gear upon the end of said shaft, a second gear co-operating therewith and mounted for rotary movement in a plane parallel with the path of reciprocation of the needle, a rod or bar connected to the second gear and reciprocating in a path parallel to the path of the needle, and means for reciprocating said rod or bar, a rotary support for said complementary stitch-forming mechanism and means for rotating said support.

8. A buttonhole-sewing machine comprising stitch-forming mechanism capable of bodily rotation, three shafts, buttonhole-cutting mechanism, means for moving the stitch-forming mechanism relatively to the cutting mechanism, connections between the first shaft and the second shaft for operating the latter connections between the first shaft and the stitch-forming mechanism for operating the same to form stitches, connections between the second shaft and the cutting mechanism for operating the same, connections between the third shaft and the stitch-forming mechanism for rotating the same in either direction, means for operating the third shaft intermittently from the first shaft to rotate the stitch-forming mechanism step by step during the stitching of the buttonhole, means to operate the third shaft continuously from the second shaft to rotate the stitch-forming mechanism continuously in the direction opposite to that obtained during the stitching.

699,872. BALANCE VALVE FOR GAS-ENGINE. SHERMAN E. DINE, Pawtucket, R.I., assignor of one-half to Edmund W. Gravel, Pawtucket, R.I. Filed Oct. 6, 1900. Serial No. 32,394. (No model.)

Claim.—1. A rotatable valve for a gas-engine having two disks secured to a valve-stem, a body between the two disks containing the inlet and the outlet passages, an opening in one of the disks arranged to register with said passages as the valve rotates, and a chamber including the

valve, whereby the force of the explosion is exerted equally on the two disks, as described.

2. In a gas-engine, the combination with the cylinder, of a perforated disk, inlet and outlet passages in the disk, two valve-disks bearing on the opposite sides of the perforated disk and secured to a common valve-stem, the part of, and a cap, as described.

3. A gas-engine valve having two disks secured to a valve-stem, inlet and outlet passages between the two disks, an opening in one of the disks, and a combustion-chamber including both of the valve-disks, as described.

4. In a gas-engine, a cylinder having a perforated disk containing the inlet and outlet passages, a cap secured to the end of the cylinder, a rotary valve-disk having an opening controlling the inlet and outlet ports, a valve-stem journaled in the perforated disk, and a disk secured to the end of the valve-stem and bearing on the opposite side of the perforated disk, as described.

699,873. SOFT-THREAD HORNSEHOE. OSCAR E. DYER, Chicago, Ill. Filed Jan. 6, 1900. Renewed July 3, 1901. Serial No. 67,007. (No model.)

Claim.—1. The combination, with a hornshoe having a projecting stud, of a pad or cushion of rubber or other elastic material, and a coil of spring-wire embedded in the pad or cushion and adapted to receive and grip the stud, substantially as described.

2. The combination, with a hornshoe having a seat or recess and a stud or pin projecting into the same, of a pad or cushion of rubber or other elastic material adapted to fit said recess, and a coil of wire embedded in said pad and adapted to receive and grip said stud, substantially as described.

3. The combination, with a hornshoe having a pair of studs projecting therefrom, of a pad or cushion of rubber or the like, and a wire bent to form two coils and an intermediate connecting portion and embedded in the pad or cushion, said coils being adapted to receive and grip the studs, substantially as described.

4. The combination, with a hornshoe having two projecting studs, of a pad of rubber or the like, and a wire bent to form two oppositely-twisted coils and an intermediate connecting portion and embedded in the pad or cushion, said coils being adapted to receive and grip the studs, substantially as described.

5. The combination, with a hornshoe having a socket or recess and studs projecting into the same, of a pad or cushion of rubber or the like adapted to fit said socket or recess, and a wire bent to form two oppositely-twisted coils and an intermediate connecting portion and embedded in the pad or cushion, said coils being adapted to receive and grip the studs, substantially as described.

6. The combination with a hornshoe, of a cushion-tread portion, and a coiled wire uniting the cushion-tread portion with the body of the shoe, substantially as described.

7. The combination with a hornshoe, of a cushion-tread portion and united coils of wire for joining the tread portion with the body of the shoe, substantially as described.

8. The combination with a hornshoe, of a cushion-tread portion therefor, and united coils of wire oppositely twisted for joining the said tread portion with the body of the shoe, substantially as described.

9. The combination with a hornshoe, of studs 7, 7, extending from the body thereof, a tread-cushion having a connection 10 embedded therein and adapted for engagement with the said studs, the said studs being surrounded by the cushion, substantially as described.

10. The combination with a hornshoe, of a stud projecting from the body thereof, a tread-cushion surrounding the stud, and a fastening device 10 contained within the cushion and engaging the said stud to secure the cushion in place, substantially as described.

699,874. TRUNCHED SCALING-LADDER. GEORGE A. BURNHAM and A. E. HYMAN, Spokane, Wash. Filed Oct. 21, 1901. Serial No. 73,294. (No model.)

Claim.—The combination of the double wooden ladder-shaft, trunched, each of the wooden ladder-shafts being supported on the outside by continuous steel strips, running the entire length of the ladder and extending beyond at the top of the ladder, terminating in a hook, the said wooden ladder-shafts and the said steel strips being morticed at intervals to receive the ladder-rungs, the rungs formed by the ladder-shafts being retained by shoulders on the ladder-rungs between the shafts, the steel cushion thrust onto the hook at the top of the ladder and a ladder-rest attached to the back of the ladder-rungs, substantially as set forth.

699,874.

699,875. SAFETY APPLIANCE FOR ELEVATORS. JOHN E. BROWN, Chicago, Ill. Filed Feb. 24, 1902. Serial No. 95,251. (No model.)

Claim.—1. In a device of the kind described, elevator-cars arranged in pairs to simultaneously move in opposite directions, and means for operating them, in combination with supplemental supporting means connecting the cars, whereby upon the parting of either of the supporting cable motions the cars will mutually contain one another.

2. In a device of the kind described, elevator-cars arranged in pairs and secured in a dependent supporting end of a common cable, having a central crossed light, and means for operating the cable, in combination with means securing the cars to the proximate line of the light, whereby upon the parting of either of the supporting ends of the cable, the cars will be contained and mutually contain each other.

3. In a device of the kind described, elevator-cars arranged in pairs and secured in a dependent supporting end of a common cable, spacing-wheel 18, 18, spacing the lines of a crossed central light, and means for operating the cable, in combination with means for securing the cars to the proximate line of the light, whereby upon the parting of either of the ends of the cable the cars will be contained and mutually contain each other.

4. In a device of the kind described, vertical ways 1, 1, provided with transverse supporting-beams 2, 2, and wheels or rollers 3, 3, in combination with cars 6, 6, provided with guides or shoes 7, engaging the ways 1, a cable 8, having its free ends secured to the cars and thence extended upward over the wheels 3, a central crossed light 14, 14, connecting the proximate lines of the light and supporting end 8, to simultaneously

only move in the same direction, clamps 15, 15, secured to the light as indicated, and means connecting the cars with the proximate line of the light 14, above said clamps, whereby the cars are supplementally connected, substantially as described.

699,876. SPRING-FRAME FOR BICYCLES. CHARLES W. BROWN, North Tonawanda, N. Y. Filed Feb. 11, 1902. Serial No. 95,491. (No model.)

Claim.—1. A spring-frame for bicycles having the upper and lower forward frame-tubes in sections, one section of the upper tube having both pivotal and vertical adjustment with respect to the frame and telescoping in another section, a coil-spring between the sections of said upper tube and a flat spring between the sections of the lower tube, substantially as set forth.

2. A spring-frame for bicycles having the upper and lower forward frame-tubes in sections, a coil-spring between the sections of the upper tube, a flat spring between the sections of the lower tube and two springs having their outer ends superposed upon the flat spring and their inner ends bent up and normally in proximity, substantially as set forth.

3. A spring-frame for bicycles having the upper forward tube composed of a pivotal portion and a rigid portion, a coil-spring interposed between said portions, a sectional lower tube and a flat spring between the sections of said lower tube, substantially as set forth.

4. In a spring-frame for bicycles, an upper forward tube composed of a pivotal rear portion, a rigid front portion, a casing screwing into said front portion, a coil-spring having its ends in the rear portion and casing, a lower tube in sections and a spring connection between said sections, substantially as set forth.

5. A spring-frame for bicycles having a sectional upper tube composed of a rigid front portion, a casing longitudinally adjustable in said front portion, a pivotal rear portion telescoping in the casing, a coil-spring in the casing and rear portion, a sectional lower tube and a spring connection between the sections of the lower tube, substantially as set forth.

6. A spring-frame for bicycles having a sectional upper tube composed of a rigid front portion, a casing longitudinally adjustable in said front portion, a pivotal rear portion telescoping in the casing, a coil-spring in the casing and rear portion, a ball-bearing device supported from the casing having the balls connecting with the telescopic part of the rear portion, a sectional lower tube and a spring connecting the sections of said lower tube, substantially as set forth.

7. A spring-frame for bicycles having an upper tube composed of a front section and a rear section, a casing fitting in the rear end of said front section and having a flange at its rear extremity, one surface of which is beveled to form a bearing, an outer bearing-cup screwing on the flange, a series of balls between the flange-bearing surface and the outer bearing-cup; the rear section telescoping in the casing, a coil-spring supported in the casing and rear section, a lower tube in sections and a spring connecting the sections of said lower tube, substantially as set forth.

8. A spring-frame for bicycles and the like having a sectional upper tube; one section having a vertically elongated slotted connection with the frame whereby both pivotal and vertical adjustments are obtained and another section being rigid with the frame, a coil-spring between said sections, a sectional lower tube, and a spring between the sections of the lower tube, substantially as set forth.

9. In a spring-frame, a seat-post tube, a bifurcated lag extending forwardly from the upper extremity of the seat-post tube, a sectional upper frame member, one section of which is rigid and another section telescoping in said rigid section, a vertical slotted lag extending from said telescoping section and pivoted to the bifurcated section, a coil-spring between the sections, a sectional lower tube, and a spring between the sections of the lower tube, substantially as set forth.

10. A spring-frame for bicycles and the like having a sectional upper tube; one section having a vertically-elongated slotted connection with the frame whereby both pivotal and vertical adjustments are obtained and another section being rigid with the frame, a coil-spring between said sections and a sectional lower tube having yieldingly-jointed sections, substantially as set forth.

11. In a spring-frame, a seat-post tube, a bifurcated lag extending forwardly from the upper extremity of the seat-post tube, a sectional upper frame member, one section of which is rigid and another section telescoping in said rigid section, a vertical slotted lag extending from said telescoping section and pivoted to the bifurcated section, a coil-spring between the sections, a sectional lower tube, and a spring between the sections of the lower tube, substantially as set forth.

scopes in said rigid section, a vertical slotted lag extending from said telescoping section and pivoted to the bifurcated section, a coil-spring between the sections and a sectional lower tube having yieldingly-jointed sections, substantially as set forth.

12. A spring-frame for bicycles having an upper frame-tube in sections, one section of said upper tube having both pivotal and vertical adjustment with respect to the frame and telescoping in another section, a coil-spring between the sections of said upper tube and a sectional lower frame-tube having yieldingly-jointed sections, substantially as set forth.

699,877. VALVE. FREDERICK F. FINE, Providence, R. I. Filed Apr. 2, 1901. Serial No. 54,884. (No model.)

Claim.—1. The combination of an inlet-pipe, an outlet-pipe and a chamber connecting the two said pipes, a valve-casing arranged within the inlet-pipe with its inner end closed and provided with a valve-seat at its outer end and communicating with said chamber, the walls of said valve-casing being provided with ports or openings communicating with said inlet-pipe and arranged in a plane or planes oblique to the axis of said casing and extending over an arc about equal to the range of movement of the valve, an imperforate valve moving within said casing and having its periphery sliding over the said ports or openings in the casing and its outer face acting upon the said valve-seat to close the passage at each point, the pressure of the fluid upon said valve serving to normally hold the valve closed on its seat, and means for pushing the valve from its seat to open the passage, said means being disconnected from said valve, substantially as and for the purpose set forth.

2. The combination of an inlet-pipe, an outlet-pipe and a chamber connecting the two said pipes, a valve-casing arranged within the inlet-pipe with its inner end closed and provided with a valve-seat at its outer end and communicating with said chamber, the walls of said valve-casing being provided with ports or openings communicating with said inlet-pipe and arranged in a plane or planes oblique to the axis of said casing and extending over an arc about equal to the range of movement of the valve, an imperforate valve moving within said casing and having its periphery sliding over the said ports or openings in the casing and its outer face acting upon the said valve-seat to close the passage at each point, a valve-stem mounted through the wall of said chamber with its outer end projecting to the exterior thereof and its inner end acting upon the said valve to push it open but disconnected from said valve, substantially as and for the purpose set forth.

3. The combination of an inlet-pipe, an outlet-pipe and a chamber connecting the two said pipes, a valve-casing arranged within the inlet-pipe with its inner end closed and provided with a valve-seat at its outer end and communicating with said chamber, the walls of said valve-casing being provided with ports or openings communicating with said inlet-pipe and arranged in a plane or planes oblique to the axis of said casing and extending over an arc about equal to the range of movement of the valve, an imperforate valve moving within said casing and having its periphery sliding over the said ports or openings in the casing and its outer face acting upon the said valve-seat to close the passage at each point, a reciprocating valve-stem adapted to push upon the outer face of said valve to force it from its seat against the pressure of the fluid, the said valve-stem being provided within said chamber with a fluid cushion which is supplied with fluid from said chamber to prevent the sudden closing of the valve on its seat, substantially as and for the purpose set forth.

4. In a faucet, the combination with a valve-operating stem provided with a cup and a stationary seat in the cup, of the valve-seat of the tubular above a provided with a series of diagonally-arranged ports or openings of the plug of in cross-thread engagement with the above, the stem of the valve, and the valve, as described.

699,878. ROUND BEATING-GRATE. FRANK W. FOSTER, Worcester, Mass. Filed Dec. 2, 1901. Serial No. 54,867. (No model.)

Claim.—1. In a round boiler-grate, the combination with a ring-frame, of parallel grate-bars supported at the ends on the frame and at the middle by rocker-bars, the rocker-bars, the ring-frame comprising

straight chord members, wherein the rocker-bars are pivoted, side brackets on the chord members, the outer grate-bars resting on the said brackets.

2. In a round boiler-grate, the combination with a ring-frame comprising straight chord members and side brackets projecting from said chord members, parallel grate-bars supported at the ends in the frame and at the middle by rocker-bars, the outer grate-bars resting in the said side brackets, the rocker-bars, pivotally hung on the frame, and an annular fire-supporting surface made in section, filling the space between the ends of the grate-bars and the fire-box wall, and supported by the ring-frame.

3. In a round boiler-grate, the combination of parallel grate-bars supported by a frame, the frame, consisting of ring-segments, hangers depending from the ring-segments, chord-bars secured to the hangers at a level below that of the ring-segments, and rocker-bars hung on the chord-bars, and connected to the grate-bars, substantially as described.

699,879. CLUTCH AND STOP MECHANISM. JOSEPH FRANK WOODWARD, R. I. Filed July 10, 1901. Serial No. 61,721. (No model.)

Claim.—1. In combination, a rotatable carrier having the dog pivotally connected therewith, the toothed wheel engaged by the said dog, a controller-wheel also connected with said dog, a spring operating to cause said dog to engage with said toothed wheel, and means to act upon said controller-wheel to effect the disengagement of said dog from said toothed wheel, substantially as described.

2. In combination, a rotatable carrier having the dog pivotally connected therewith, the toothed wheel engaged by the said dog, the con-

troller-wheel operatively connected with the said dog, the spring operating to cause said dog to engage with said toothed wheel, and the stop-dog to arrest the rotation of said controller-wheel and thereby occasion the disengagement of said dog from said toothed wheel, substantially as described.

3. In combination, a rotatable carrier, the dog pivotally mounted upon said carrier, the engaging portion movably applied to the main part of the dog, the yielding cushion between said main part and said engaging portion, the toothed wheel engaged by said engaging portion, a controller-wheel also connected with the dog, a spring operating to cause the dog to be moved to place its engaging portion in engagement with the toothed wheel, and means to set upon said controller-wheel to effect the disengagement of said dog from said toothed wheel, substantially as described.

4. In combination, a rotatable carrier, the dog pivotally mounted upon said carrier, the engaging portion movably applied to the main part of the dog, the yielding cushion between said main part and said engaging portion, the toothed wheel engaged by said engaging portion, a controller-wheel also connected with the dog, a spring operating to cause the dog to be moved to place its engaging portion in engagement with the toothed wheel, and the stop-dog to arrest the rotation of said controller-wheel and thereby occasion the disengagement of said dog from said toothed wheel, substantially as described.

5. In combination, the rotatable carrier having the dog pivotally connected therewith, the toothed wheel engaged by the said dog, the controller-wheel operatively connected with the said dog, the spring operating to cause said dog to engage with said toothed wheel, the stop-dog to arrest the rotation of said controller-wheel and thereby occasion the disengagement of said dog from said toothed wheel, and a movable support for said stop-dog, substantially as described.

6. In combination, a rotatable carrier, the dog pivotally mounted upon said carrier, the engaging portion movably applied to the main part of the dog, the yielding cushion between said main part and said engaging portion, the toothed wheel engaged by said engaging portion, a controller-wheel also connected with the dog, a spring operating to cause the dog to be moved to place its engaging portion in engagement with the toothed wheel, the stop-dog to arrest the rotation of said controller-wheel and thereby occasion the disengagement of said dog from said toothed wheel, and a movable support for said stop-dog on which it is independently movable, and a yielding cushion for said stop-dog, substantially as described.

7. In combination, a rotatable carrier having the dog pivotally connected therewith, the toothed wheel engaged by the said dog, the controller-wheel operatively connected with the said dog, the spring operating to cause said dog to engage with said toothed wheel, the stop-dog to arrest the rotation of said controller-wheel and thereby occasion the disengagement of said dog from said toothed wheel, and the recoil-dog whereby recoil of the parts is prevented, substantially as described.

8. In combination, a rotatable carrier having the dog pivotally connected therewith, the toothed wheel engaged by the said dog, the controller-wheel operatively connected with the said dog, the spring operating to cause said dog to engage with said toothed wheel, the stop-dog to arrest the rotation of said controller-wheel and thereby occasion the disengagement of said dog from said toothed wheel, and the recoil-dog under control of said stop-dog, whereby when said stop-dog is caused to set the said recoil-dog is brought into action also, substantially as described.

9. In combination, a rotatable carrier having the dog pivotally connected therewith, the toothed wheel engaged by the said dog, the controller-wheel operatively connected with the said dog, the spring operating to cause said dog to engage with said toothed wheel, the stop-dog to arrest the rotation of said controller-wheel and thereby occasion the disengagement of said dog from said toothed wheel, the recoil-dog, and the yielding connection between the recoil-dog and the stop-dog, substantially as described.

10. In combination, a rotatable carrier having the dog pivotally connected therewith, the toothed wheel engaged by the said dog, the controller-wheel operatively connected with the said dog, the spring operating to cause said dog to engage with said toothed wheel, the stop-dog to arrest the rotation of said controller-wheel and thereby occasion the disengagement of said dog from said toothed wheel, a movable support for said stop-dog on which it is independently movable, and a yielding cushion for said stop-dog, the recoil-dog, and the yielding connection between the recoil-dog and the stop-dog, substantially as described.

11. In combination, a rotatable carrier, the dog pivotally mounted upon said carrier, the engaging portion movably applied to the main part of the dog, the yielding cushion between said main part and said engaging portion, the toothed wheel engaged by said engaging portion, a controller-wheel also connected with the dog, a spring operating to cause the dog to be moved to place its engaging portion in engagement with the

toothed wheel, the stop-dog to arrest the rotation of said controller-wheel and thereby occasion the disengagement of said dog from said toothed wheel, and a movable support for said stop-dog on which it is independently movable, and a yielding cushion for said stop-dog, the recoil-dog, and the yielding connection between the recoil-dog and the stop-dog, substantially as described.

699,880. HYDROCARBON-BURNER. EDWARD E. FULLAWAY, Los Angeles, Cal. Filed Oct. 31, 1901. Serial No. 99,999. (No model.)

Claim.—1. A hydrocarbon-burner consisting of a casing having a partition arranged to divide the interior thereof into two parallel longitudinal chambers, terminating in the same vertical line, and provided with ports, the lower of said chambers having a vertically-adjustable uncovered swirl-blade, whose upper surface projects in front of said chamber at an angle.

2. A burner, composed of an oil-chamber disposed above a steam-chamber, both of said chambers having ports which open on the same vertical line, said steam-chamber having in its front composed of an uncovered swirl-blade whose upper surface projects upward at an angle to the central line of the steam-chamber.

3. In a burner in which oil and steam are discharged into the fire-box from separate chambers, having ports terminating on the same vertical line, the oil-chamber being disposed above the steam-chamber; an uncovered swirl-blade extending across and at the lower edge of the steam-port; said swirl-blade having its upper surface projecting in front of the steam-port, upwardly at an angle to a plane which is parallel with the center line of the steam-chamber.

699,881. OUTLET-BOX FOR ELECTRIC WIRES AND CONDUITS. JAMES H. C. FULLER, Pittsburg, Pa. Filed May 14, 1901. Serial No. 99,999. (No model.)

Claim.—1. A water-tight floor outlet-box for electric wires comprising a stationary box and a cap to close the same adapted to be adjusted with reference to the floor-level vertically and horizontally.

2. A water-tight floor outlet-box for electric wires comprising a stationary box, a cap or plate to close the same, and means interposed between the box and plate to seal the space between the same and at the same time permit the plate to be adjusted to the floor-level both vertically and horizontally independently of the box.

3. A water-tight floor outlet-box comprising a box, having around the rim thereof a deep channel or groove, a ring the lower rim of which is adapted to be adjusted to said channel to conform with the floor-level, a cap or plate adapted to be secured to said ring, in combination with a plastic compound adapted to be charged into the channel of the box around the lower rim of the ring to form a water seal at each point.

4. A water-tight floor outlet-box comprising a box, having a deep channel or groove around the rim thereof, a ring the lower rim of which is adapted to be adjusted to said channel to conform with the floor-level, a cap or plate adapted to be secured to said ring, a gasket interposed between said cap and ring, in combination with a plastic compound adapted to be charged into said channel of the box around the lower rim of the ring to form a water seal at each point.

699,882. TROLLEY-WHEEL-TURNING MACHINE. EDWARD O'CALLAGHAN, Lynn, Mass. Filed Apr. 11, 1900. Serial No. 12,882. (No model.)

Claim.—1. A turning device consisting of a rotating shaft to which the wheel is secured, a pivoted lever having a tool secured thereto, means for producing longitudinal movements of said lever, a fixed screw having jointed connections with said lever, which is adapted to swing said lever on its pivot, a fixed cam-disk, a pin carried by said lever for engaging said disk, whereby said lever will be caused to simultaneously swing laterally and move longitudinally.

2. A turning device comprising a rotating shaft to which the wheel is secured, a pivoted lever having tool secured thereto, means for producing longitudinal movements of said lever, a fixed screw having jointed connections with said lever, which is adapted to swing said lever on its pivot, a cam, means for causing said cam to move said lever longitudinally while it is moved laterally.

3. A turning device consisting of a rotating shaft, to which the wheel is secured, a main operating-lever, a tool secured thereto, which is arranged to engage the work at one side of the shaft, means for swinging said lever on its pivot, means for simultaneously moving said lever longitudinally, a pair of secondary levers carrying tools which are adapted to engage the work at the opposite side of the shaft, means connecting said main lever to said secondary levers, which are adapted to move the latter simultaneously with the movement of the former.

4. A turning device consisting of a rotating shaft, to which the wheel is secured, a main operating-lever, a tool secured thereto, which is arranged to engage the work at one side of the shaft, means for swinging said lever on its pivot, means for simultaneously moving said lever longitudinally, a pair of secondary levers carrying tools which are adapted to engage the work at the opposite side of the shaft, means connecting said main lever and said secondary levers which are adapted to swing the latter on their pivots and move them longitudinally, simultaneously with the movement of the former.

5. A turning device consisting of a rotating shaft to which the wheel is secured, a main operating-lever, a tool secured thereto which is arranged to engage the work at one side of the shaft, means for swinging said lever on its pivot, means for simultaneously moving said lever longitudinally, a pair of secondary levers carrying tools which are adapted to engage the work at the opposite side of the shaft, a reciprocating support for said secondary levers, a rod connected to said support, connections between said rod and said main lever which will cause said rod to reciprocate when said main lever is swinging on its pivot, and means which are adapted to engage said secondary levers and swing them on their pivots during their reciprocating movements.

6. A turning device consisting of a rotating shaft to which the wheel is secured, a main operating-lever, a tool secured thereto which is arranged to engage the work at one side of the shaft, means for swinging said lever on its pivot, means for simultaneously moving said lever longitudinally, a pair of secondary levers carrying tools which are adapted to engage the work at the opposite side of the shaft, a reciprocating support for said secondary levers, a rod connected to said support, connections between said rod and said main lever which will cause said rod to reciprocate when said main lever is swinging on its pivot, a spring which acts constantly to draw the tool of said secondary levers in one direction, a cam arranged between each of said levers and a fixed portion of the machine which causes said levers to swing as they are reciprocated.

7. A turning device consisting of a rotating shaft to which the wheel is secured, a lever carrying a tool which is adapted to engage the work, a reciprocating support to which said lever is pivoted, a spring which acts constantly to draw the tool away from the work, a cam carried by said lever, a central roll with which said cam is drawn in contact by said spring, and means for moving said roll longitudinally.

8. A turning device consisting of a rotating shaft to which the wheel is secured, a movable support carrying a tool, means for moving said tool with respect to the work, a fixed screw, means for rotating the same, a nut which is adapted to engage one side of said screw, a connection between said support and said nut, means for holding said nut in engagement with said screw, and means for automatically moving said nut laterally out of engagement with said screw when said support has been moved a predetermined distance.

9. A turning device consisting of a rotating shaft to which the wheel is secured, a movable support having a tool which is adapted to engage the work, a screw-threaded shaft, means for rotating the same, a nut which is adapted to engage one side of said shaft, a suitably-guided rod which is connected to said nut, a spring which acts constantly to draw said nut out of engagement with said screw, a projection carried by said rod, an inwardly-projecting flange which is adapted to engage the upper side of said projection and hold said nut in engagement with said screw-threaded connection between said rod and said movable support, said flange being of such length that said projection will pass from under the same when said support has been moved the desired distance and permit said spring to move said nut out of engagement with said screw, said part being arranged so that said projection may pass above said flange and move above the same as the support is returned to its initial position.

10. A device for turning trolley-wheels consisting of a rotating shaft to which a trolley-wheel is secured, a tool-holder, means for moving the same laterally and longitudinally of the wheel so as to turn off the face thereof, a reciprocating carriage, a rod connected to said carriage, means connecting said rod and said tool-holder for reciprocating said rod as said holder is moved from one side of the wheel to the other, side tools connected to said carriage which are adapted to engage the sides of the wheel, means for moving said side tools laterally with respect to the line of movement of said carriage as the latter is reciprocated, a pair of tool-carriers provided with tools which are adapted to engage the ends of the hub of the wheel, and means connecting said tool-carrier and said rod which are adapted to cause the tool of said carrier to engage the wheel-hubs as said rod is reciprocated.

11. A turning device comprising a rotatable shaft to which the wheel is secured, a pivoted lever, means for simultaneously swinging said lever on its pivot and moving it longitudinally, a tool secured to said lever, and means for tipping said tool laterally in either direction during the movements of the lever.

12. A turning device comprising a rotating shaft to which the wheel is secured, a tool having a bit, the upper or cutting end portion of which is cylindrical and the end of which is substantially flat and is in a plane perpendicular to the center line of the bit, means for supporting said bit and for adjusting the same vertically and means for automatically varying the inclination of said bit so that it will engage the work at various angles while it is taking off the same chip.

13. A turning device comprising a rotating shaft to which the wheel is secured, a tool which is supported adjacent thereto, and has a normally horizontal cutting edge, a bearing in which the shaft of said tool is journaled so that it may be tipped laterally in either direction, a lever connected to said tool, a cam which engages said lever and means for moving said bearing laterally with respect to the work.

699,883. INSULATING COMPOSITION AND METHOD OF PREPARING SAME. ADOLF VETTER, Vienna, Austria-Hungary. Filed Aug. 30, 1901. Serial No. 73,798. (No specimens.)

Claim.—1. An insulating composition consisting of gum-rubber or caoutchouc and a vegetable wax kneaded together under a mild heat which is increased gradually during the kneading operation, substantially as and for the purposes set forth.

2. An insulating composition, consisting of gum-rubber or caoutchouc and carnauba-wax combined together, in about the proportions stated, by kneading under the influence of a mild heat, substantially as and for the purposes set forth.

3. The method of making an insulating composition, which consists in first subjecting gum-rubber or caoutchouc and vegetable wax, to a kneading operation under the influence initially of a mild heat, and in then increasing said heat during the kneading operation, to convert said mass into a composition of a plastic nature, substantially as and for the purposes set forth.

699,884. HOSE-POWELL. HENRY POWELL, Chicago, Ill., assignor to W. D. Allen Manufacturing Company, Chicago, Ill., a Corporation. Filed Feb. 24, 1903. Serial No. 95,235. (No model.)

Claim.—1. A hose-cumple comprising a chambered hose portion, a tubular body revolvably connected to said hose portion and formed with one or more lateral perforations, a tubular stem or part having one or

more lateral perforations adapted to coincide with the perforations of the tubular body and means for holding said stem or part against revolution on the tubular body is revolved, whereby the coincidence between the perforations of the tubular stem and of the tubular body may be varied to change the character of the stream through the nozzle.

2. A base-nozzle comprising a base portion having an annular chamber, a tubular body revolvably connected to said base portion and having a laterally-perforated part extending into said chamber, a tubular stem or part located within said chamber and having a laterally-perforated part engaging the inner end of the tubular body and means for holding said stem or part against revolution as the tubular body is revolved.

3. A base-nozzle comprising a chambered base portion provided with a valve-seat, a tubular body revolvably connected to said base portion and having its inner end formed with one or more lateral perforations, a tubular stem or part having one or more lateral perforations adapted to coincide with the perforations of the tubular body, means for holding said stem or part against revolution as the tubular body is revolved, said stem or part being provided with a valve adapted to close against the valve-seat of the base portion.

4. A base-nozzle comprising a chambered base portion having a valve-seat, a tubular body revolvably connected to said base portion and formed with one or more lateral perforations and with a screw-threaded inner end, a screw-threaded tubular stem comprising a valve and engaging the inner end of said tubular body and provided with one or more lateral perforations and means for holding said stem against revolution as the tubular body is revolved.

5. A base-nozzle comprising a base portion A having a valve-seat *a'* and a chamber *a''*, tubular body B having an interiorly-threaded and laterally-perforated inner end extending into said chamber *a''* and revolvably connected with said base portion, an exteriorly-threaded and laterally-perforated tubular stem D engaging said tubular body and carrying a valve adapted to close against the valve-seat *a'* and a web or part D' for holding said stem D against revolution.

699,885. TWISSENS WITH HEART, ALL IN ONE PIECE.
GEO. HAYES, NEWARK, N. J., assignor to Hayes Manufacturing Company, Newark, N. J., a Corporation of New Jersey. Filed June 25, 1891. Serial No. 68,114. (No model.)

Claim.—1. A twissens having an integral tang and formed therefrom in one continuous narrow strip of sheet metal, with the jaws at the ends of each strip and each jaw having an integral tang-portion extended from its cheek upon the middle of the strip, the tang-portion being integrally united at their contiguous ends, and folded upon one another to form the tang, and an ornamental handle secured upon each tang to form part of a mounted toilet set, substantially as herein set forth.

2. A twissens having the jaws formed each of sheet metal with flat cheek and integral tang-portion of semicircular form extended into the flat cheek, and the cheek having shoulders upon each tang-portion to fit a bolster, substantially as herein set forth.

3. A twissens formed in one piece of sheet metal with an integral tang having semicircular sections, the cheek of the twissens having shoulders upon each tang, and the bolster *c* applied to the tang next the shoulder to hold the jaws elastically together.

4. The twissens formed in one piece of sheet metal with an integral tang having semicircular sections, the cheek of the twissens having shoulders upon each tang, the bolster *c* applied to the tang next the shoulder, and handle secured upon the tang in contact with the bolster.

699,886. FLUID-PRESSURE BRAKE. HARRY W. HUBBARD, Chicago, Ill., assignor to Richard Fitzgerald, Chicago, Ill. Filed Dec. 17, 1891. Serial No. 68,304. (No model.)

Claim.—1. In combination with an air-brake system, an air-reservoir supplemental to the usual auxiliary reservoir, a brake-cylinder pressure-regulating device, a casing having a chamber provided with a valve-seat on whose face terminate parts or connections respectively with the supplemental reservoir, brake-cylinder, the pressure-regulating device and the atmosphere, said chamber also having a communication with the auxiliary reservoir, a rotary disk valve working on said seat and having means for controlling said various parts and connections, substantially as described, and means for operating the valve from the side of the car.

2. In combination with an air-brake system, an air-reservoir supplemental to the usual auxiliary reservoir, a brake-cylinder pressure-regulating device, a casing having a chamber provided with a valve-seat on whose face terminate parts or connections respectively with the supplemental reservoir, brake-cylinder, the pressure-regulating device and the atmosphere, said chamber also having a communication with the auxiliary reservoir, a rotary disk valve working on said seat and having the two parts 20 and 21 and means 22 for controlling said parts and connections and having a valve-seat, an operating-lever secured to the stem, and operating-rods connected to the lever and extending to opposite sides of a car.

3. In combination with an air-brake system, an air-reservoir supplemental to the usual auxiliary reservoir, a brake-cylinder pressure-regulating device, a casing having a chamber provided with a valve-seat on whose face terminate parts or connections respectively with the supplemental reservoir, brake-cylinder, the pressure-regulating device and the atmosphere, said chamber also having a communication with the auxiliary reservoir, a rotary disk valve working on said seat and having the two parts 20 and 21 and means 22 for controlling said parts and connections, a valve-seat for operating said valve, a lever connected to said stem and having the opposite arms 38 and 39 and operating-rods connected to each lever-arm respectively and extending to opposite sides of a car.

4. In combination with an air-brake system, an air-reservoir supplemental to the usual auxiliary reservoir, a brake-cylinder pressure-regulating device, a casing having a chamber provided with a valve-seat on whose face terminate parts or connections respectively with the supplemental reservoir, brake-cylinder, the pressure-regulating device and the atmosphere, said chamber also having a communication with the auxiliary reservoir, a rotary disk valve working on said seat and adapted to govern said parts and connections, a valve-seat detachably but operatively connected to each valve and extending through one side of the casing, operating devices secured to the valve-seat, a flange 15 on the stem within the valve-chamber, and a gasket 16 on which said flange is seated.

5. In combination with an air-brake system, an air-reservoir supplemental to the usual auxiliary reservoir, a brake-cylinder pressure-regulating device, a casing having a chamber provided with a valve-seat on whose face terminate parts or connections respectively with the supplemental reservoir, brake-cylinder, the pressure-regulating device and the atmosphere, said chamber also having a communication with the auxiliary reservoir, a rotary valve 13 working on said seat to govern said parts and connections, valve-stem 14 for each valve, a cap 12 secured to the casing and forming a wall of the valve-chamber, and provided with a central bore through which said stem passes, and means for operating the valve-stem and valve.

6. In combination with an air-brake system, a supplemental air-reservoir, a brake-cylinder pressure-regulating device, a casing having a chamber provided with a valve-seat having terminating thereon a part 9 to the supplemental reservoir, a part 6 to the brake-cylinder, a part 25 to the pressure-regulating device, and a part 27 to the atmosphere, a disk valve having a recess 22 and two parts 20 and 21, the recess in normal position connecting parts 9 and 25, in loaded-car position, the parts 9 and 20 being in register to connect the two reservoirs and the recess no longer connecting parts 9 and 25 and in bleed position, the parts 21 and 27 being in register to release the auxiliary-reservoir pressure.

7. The combination with an air-brake system, a supplemental air-reservoir, a brake-cylinder pressure-regulating device, a casing having a valve-chamber provided with communication with the air-brake system, with the supplemental reservoir and with the pressure-regulating device, the lower end or portion of the casing being formed as a screw-threaded extension by which the pressure-regulating device is received and a rotary disk valve is held chamber in govern said communication.

8. In combination with an air-brake system, a supplemental air-reservoir, a brake-cylinder pressure-regulating device, a casing having a valve-chamber provided with communication with the air-brake system, with the supplemental reservoir and with the pressure-regulating device, said casing having the auxiliary-reservoir connection 7, and a similar but normally closed connection 7', whereby the auxiliary-reservoir air may enter the chamber from either side, and a valve in said chamber to govern said communication.

9. In combination with an air-brake system, a supplemental air-reservoir, a brake-cylinder pressure-regulating device, a casing having a valve-chamber provided with communication with the air-brake system, with the supplemental reservoir and with the pressure-regulating device, said casing having the two auxiliary-reservoir connections 7 and 7' either one of which may be used for the reservoir air and the other one of which is closed but adapted to act as an oiling-bolt, said connections entering the chamber above the bottom whereby a supply of oil may be introduced so that the valve will work in oil.

10. In combination with an air-brake system, a supplemental air-reservoir, a brake-cylinder pressure-regulating device, a casing having a valve-chamber provided with a vertical valve-seat on whose face terminate communications respectively with the supplemental reservoir, with the brake system and with the pressure-regulating device, a rotary disk valve working on said seat to govern said communication, said casing and chamber having the two auxiliary-reservoir connections 7 and 7' either one of which may be used for the reservoir air and the other one of which is closed but adapted to act as an oiling-bolt, said connections entering the chamber above the bottom whereby a supply of oil may be introduced so that the valve will work in oil.

11. In combination with an air-brake system and the usual bleed-rods thereof, a supplemental reservoir, a casing having a valve-chamber provided with communication respectively with the air-brake system, the supplemental reservoir and the atmosphere, a valve in said chamber to govern said communication, and an operative connection between the valve and bleed-rods whereby the usual pull on either rod bleeds or releases the auxiliary reservoir and on inward push on either rod operates the valve to connect the supplemental and auxiliary reservoirs for greater braking force for loaded cars.

12. In combination with an air-brake system and the usual bleed-rods thereof, a supplemental reservoir, a brake-cylinder pressure-regulating device, a casing having a valve-chamber provided with communication respectively with the brake system, supplemental reservoir, pressure-regulating device, and the atmosphere, a valve in said chamber to govern said communication, and an operative connection between the valve and the bleed-rods whereby the usual pull on either rod bleeds or releases the auxiliary reservoir as heretofore while on inward push or thrust on either rod adjusts the valve to loaded-car position, the normal position of each valve and rods representing empty-car position.

13. In combination with an air-brake system comprising the trip-valve 1, trip-valve 2, auxiliary reservoir 3, brake-cylinder 4, a supplemental reservoir 5, a pressure-regulating device, a valve device 6 having a chamber 11 in communication with the brake-cylinder through a port and passage 8, with the supplemental reservoir, through a port and passage 9, with the pressure-regulating device through a port and passage 25 and with the atmosphere through a port and passage 27, a disk valve 13 having the two transverse parts 20 and 21 and a recess 22, said chamber also having a port and passage 7 to the auxiliary reservoir, a valve-stem 14 for the valve, an operating-lever connected to the stem and having the lever-arms 38 and 39 provided with lugs on their outer ends and the rods 40 and 41 connected respectively to said lugs of the lever-arms.

14. In combination with an air-brake system, means for producing a partial braking pressure for a car empty and full braking pressure for a car loaded, and mechanism governed by the pressure of the brake system for controlling said means and adapted to hold the same to loaded-car position, during the entire period of loaded-car braking.

15. In combination with an air-brake system, means normally adjusted to produce partial braking pressure for a car empty and adapted to be adjusted independently of the application of the brakes to produce full braking pressure for a car loaded, and mechanism dependent upon the pressure of the brake system for holding said means to loaded-car position and adapted to return the same to normal or empty-car position.

16. In combination with an air-brake system, a device adapted to be adjusted for braking a car in proportion to its empty or loaded weight and means for automatically returning said device to its empty position only when the air has substantially passed from the entire brake system.

17. In combination with an air-brake system, a device adapted to be adjusted independently of the application of the brakes for braking a car

lower end or portion of the casing being formed as a screw-threaded extension by which the pressure-regulating device is received and a rotary disk valve is held chamber in govern said communication.

8. In combination with an air-brake system, a supplemental air-reservoir, a brake-cylinder pressure-regulating device, a casing having a valve-chamber provided with communication with the air-brake system, with the supplemental reservoir and with the pressure-regulating device, said casing having the auxiliary-reservoir connection 7, and a similar but normally closed connection 7', whereby the auxiliary-reservoir air may enter the chamber from either side, and a valve in said chamber to govern said communication.

9. In combination with an air-brake system, a supplemental air-reservoir, a brake-cylinder pressure-regulating device, a casing having a valve-chamber provided with communication with the air-brake system, with the supplemental reservoir and with the pressure-regulating device, said casing having the two auxiliary-reservoir connections 7 and 7' either one of which may be used for the reservoir air and the other one of which is closed but adapted to act as an oiling-bolt, said connections entering the chamber above the bottom whereby a supply of oil may be introduced so that the valve will work in oil.

10. In combination with an air-brake system, a supplemental air-reservoir, a brake-cylinder pressure-regulating device, a casing having a valve-chamber provided with a vertical valve-seat on whose face terminate communications respectively with the supplemental reservoir, with the brake system and with the pressure-regulating device, a rotary disk valve working on said seat to govern said communication, said casing and chamber having the two auxiliary-reservoir connections 7 and 7' either one of which may be used for the reservoir air and the other one of which is closed but adapted to act as an oiling-bolt, said connections entering the chamber above the bottom whereby a supply of oil may be introduced so that the valve will work in oil.

11. In combination with an air-brake system and the usual bleed-rods thereof, a supplemental reservoir, a casing having a valve-chamber provided with communication respectively with the air-brake system, the supplemental reservoir and the atmosphere, a valve in said chamber to govern said communication, and an operative connection between the valve and bleed-rods whereby the usual pull on either rod bleeds or releases the auxiliary reservoir and on inward push or thrust on either rod operates the valve to connect the supplemental and auxiliary reservoirs for greater braking force for loaded cars.

12. In combination with an air-brake system and the usual bleed-rods thereof, a supplemental reservoir, a brake-cylinder pressure-regulating device, a casing having a valve-chamber provided with communication respectively with the brake system, supplemental reservoir, pressure-regulating device, and the atmosphere, a valve in said chamber to govern said communication, and an operative connection between the valve and the bleed-rods whereby the usual pull on either rod bleeds or releases the auxiliary reservoir as heretofore while on inward push or thrust on either rod adjusts the valve to loaded-car position, the normal position of each valve and rods representing empty-car position.

13. In combination with an air-brake system comprising the trip-valve 1, trip-valve 2, auxiliary reservoir 3, brake-cylinder 4, a supplemental reservoir 5, a pressure-regulating device, a valve device 6 having a chamber 11 in communication with the brake-cylinder through a port and passage 8, with the supplemental reservoir, through a port and passage 9, with the pressure-regulating device through a port and passage 25 and with the atmosphere through a port and passage 27, a disk valve 13 having the two transverse parts 20 and 21 and a recess 22, said chamber also having a port and passage 7 to the auxiliary reservoir, a valve-stem 14 for the valve, an operating-lever connected to the stem and having the lever-arms 38 and 39 provided with lugs on their outer ends and the rods 40 and 41 connected respectively to said lugs of the lever-arms.

14. In combination with an air-brake system, means for producing a partial braking pressure for a car empty and full braking pressure for a car loaded, and mechanism governed by the pressure of the brake system for controlling said means and adapted to hold the same to loaded-car position, during the entire period of loaded-car braking.

15. In combination with an air-brake system, means normally adjusted to produce partial braking pressure for a car empty and adapted to be adjusted independently of the application of the brakes to produce full braking pressure for a car loaded, and mechanism dependent upon the pressure of the brake system for holding said means to loaded-car position and adapted to return the same to normal or empty-car position.

16. In combination with an air-brake system, a device adapted to be adjusted for braking a car in proportion to its empty or loaded weight and means for automatically returning said device to its empty position only when the air has substantially passed from the entire brake system.

17. In combination with an air-brake system, a device adapted to be adjusted independently of the application of the brakes for braking a car

in proportion to its empty or its loaded weight, and means governed by the pressure of the brake system for returning the device to normal position of light-weight braking.

18. In combination with an air-brake system, a device adapted to be adjusted for braking a car in proportion to its empty or loaded weight and normally maintained in empty-car position and mechanism governed by the pressure of the brake system to maintain said device in loaded-car position when so adjusted and so long as air-pressure remains in the brake system.

19. In combination with an air-brake system, a device for producing a partial braking pressure for a car empty and full braking pressure for a car loaded, a brake-cylinder pressure-regulator and mechanism actuated by the pressure of the brake system to maintain said device when adjusted for loaded-car braking.

20. In combination with an air-brake system, a device for producing a partial braking pressure for a car empty and full braking pressure for a car loaded, a brake-cylinder pressure-regulator, and fluid-pressure-actuated mechanism for maintaining said device when adjusted for loaded-car braking.

21. In combination with an air-brake system, a device adjustable for producing a partial braking pressure for a car empty and producing full braking pressure for a car loaded, a pressure-regulator for regulating the brake-cylinder pressure to a predetermined amount for said partial braking pressure, said regulator being out of service when full braking pressure is produced, and mechanism for holding said device when adjusted for full braking pressure so long as the brake system is charged with pressure.

22. In combination with an air-brake system, a device adjustable for producing a partial braking pressure for a car empty and producing full braking pressure for a car loaded, a pressure-regulator for regulating the brake-cylinder pressure to a predetermined amount for said partial braking pressure, said regulator being out of service when full braking pressure is produced, and mechanism for holding said device when adjusted for full braking pressure so long as the brake system is charged with pressure.

23. In combination with an air-brake system, valve mechanism co-operating therewith and adapted when in one position to produce a predetermined or partial braking pressure in the brake-cylinder and in another position to produce a higher or full braking pressure therein, and in a third position to bleed the auxiliary reservoir of the brake system, and mechanism for returning such valve mechanism to a normal position of partial braking pressure after adjustment to either of the other two positions.

24. In combination with an air-brake system, valve mechanism co-operating therewith and adapted when in one position to produce a predetermined or partial braking pressure in the brake-cylinder and in another position to produce a higher or full braking pressure therein, and in a third position to bleed the auxiliary reservoir of the brake system, and mechanism actuated by the pressure of the brake system for returning such valve mechanism to a normal position of partial braking pressure after adjustment to either of the other two positions.

25. In combination with an air-brake system, valve mechanism for producing a partial braking pressure for a car empty and a full pressure for a car loaded, and a fluid-pressure-actuated controller operated by pressure admitted by the valve mechanism when adjusted for full-pressure braking and having operating connection with the valve mechanism to maintain it in such adjusted position so long as the brake system remains charged with pressure.

26. In combination with an air-brake system, valve mechanism for producing a partial braking pressure for a car empty and a full pressure for a car loaded, means for operating such valve mechanism and thereby adjusting it for an empty or a loaded car, a fluid-pressure-actuated controller and a connection between the controller and said operating means, said valve mechanism being arranged to admit the fluid-pressure of the brake system to the controller when the former is adjusted to loaded-car position, and to thereby maintain it in such position.

27. In combination with an air-brake system, valve mechanism for producing a partial braking pressure for a car empty and a full pressure for a car loaded, a valve-seat for said valve mechanism, an operating-lever on said stem, and a fluid-pressure-actuated controller connected to said lever, said valve mechanism being arranged to admit pressure from the brake system to the controller when the valve mechanism is adjusted to loaded-car position whereby such adjustment is maintained so long as the brake system is charged.

28. In combination with an air-brake system, valve mechanism for producing a partial braking pressure for a car empty and a full pressure for a car loaded, operating connection for the valve mechanism, a fluid-pressure-actuated controller connected to said connection and having means for maintaining a position of normal for bleed and consequently such connection, said valve mechanism being arranged to admit pressure from

the brake system to the controller when the valve mechanism is operated in loaded-car position to thereby maintain the valve mechanism in said loaded position.

29. In combination with an air-brake system, valve mechanism for producing a partial braking pressure for a car empty and a full pressure for a car loaded, operating connections for the valve mechanism, a fluid-pressure-actuated controller connected to said connections, and a spring for holding said controller and connections in a normal position for partial braking pressure for an empty car, said valve mechanism being adapted when adjusted to loaded-car position against the tension of the controller-spring to admit pressure to the controller to overcome the spring-pressure and maintain the valve mechanism in said adjusted position.

30. In combination with an air-brake system, an air-reservoir supplemental to the usual auxiliary reservoir, a fluid-pressure-actuated controller, a valve device having communication respectively with the supplemental reservoir, auxiliary reservoir and the controller and adapted to govern such communication, operating devices connected to each valve device and to the controller whereby when the valve device is adjusted to connect the two reservoirs, air-pressure is admitted to operate the controller through whose connection with the valve device the latter is maintained in such adjusted position so long as the brake system is charged with pressure.

31. In combination with an air-brake system, an air-reservoir supplemental to the usual auxiliary reservoir, a fluid-pressure-actuated controller, a valve device having communication respectively with the supplemental reservoir, auxiliary reservoir and the controller and adapted to govern such communication, a valve-stem for each valve device, an operating-lever having operating devices running to the sides of the car, and a connection between the controller and the lever.

32. In combination with an air-brake system, an air-reservoir supplemental to the usual auxiliary reservoir, a fluid-pressure-actuated controller, a valve device having communication respectively with the supplemental reservoir, auxiliary reservoir and the controller and adapted to govern such communication, a valve-stem for each valve device, an operating-lever having operating devices running to the sides of the car and a connection between the controller and the lever, said controller comprising a piston working in a chamber and having a stem connected to said connection.

33. In combination with an air-brake system, an air-reservoir supplemental to the usual auxiliary reservoir, a fluid-pressure-actuated controller, a valve device having communication respectively with the supplemental reservoir, auxiliary reservoir and the controller and adapted to govern such communication, a valve-stem for each valve device, an operating-lever having operating devices running to the sides of the car, and a connection between the controller and the lever, said controller comprising a piston working in a chamber and having a stem connected to said connection and a spring against whose tension the piston moves.

34. In combination with an air-brake system, valve mechanism for producing a partial braking pressure for a car empty and a full pressure for a car loaded, a fluid-pressure-actuated controller operated by pressure from the valve mechanism when adjusted to loaded-car position and comprising a casing having a chamber, a piston therein having a projecting stem, a spring against whose tension the piston moves, operating devices for the valve mechanism and a connection between each stem and the said device.

35. In combination with an air-brake system, valve mechanism for producing a partial braking pressure for a car empty and a full pressure for a car loaded, a fluid-pressure-actuated controller operated by pressure from the valve mechanism when adjusted to loaded-car position and comprising a casing having a chamber, a piston therein having a projecting stem, a spring against whose tension the piston moves, an operating-lever for the valve mechanism, and a pivotal connection between the piston-stem and lever.

36. In combination with an air-brake system, valve mechanism for producing a partial braking pressure for a car empty and a full pressure for a car loaded, a fluid-pressure-actuated controller operated by pressure from the valve mechanism when adjusted to loaded-car position, and comprising a casing having a chamber, a piston therein having a stem projecting through the chamber and when moved to loaded-car position adapted to seat at one end of the chamber to prevent leakage around the stem, and a connection between the stem and valve mechanism.

37. In combination with an air-brake system, valve mechanism co-operating therewith and adapted when in one position to produce a predetermined or partial braking pressure in the brake-cylinder and in another position to produce a higher or full braking pressure therein, and in a third position to bleed the auxiliary reservoir of the brake system, a controller actuated by pressure from the valve mechanism when adjusted to full braking pressure and comprising a casing having a chamber, a piston therein having a stem operatively connected to the valve mechanism,

a double-acting spring holding the piston in normal position against movement in either direction.

38. In combination with an air-brake system, valve mechanism co-operating therewith and adapted when in one position to produce a predetermined or partial braking pressure in the brake-cylinder, and in another position to produce a higher or full braking pressure therein and in a third position to bleed the auxiliary reservoir of the brake system, a controller actuated by pressure from the valve mechanism when adjusted to full braking pressure and comprising a casing having a chamber, a piston therein having a stem operatively connected to the valve mechanism, follower-plates on the stem, a double-acting spring between said plates and abutments within the chamber for limiting the movements of the plates.

39. In combination with an air-brake system, valve mechanism for producing a partial braking pressure for a car empty and a full pressure for a car loaded, an operating-lever connected to the valve mechanism and having arms 38 and 39, operating-rods 40 and 41 connected to said arm, a branch 50 on the arm 38 having bearing-lugs 40, a controller actuated by pressure from the valve mechanism when adjusted for full braking pressure and having a movable stem 44 and a link connection 45 between the stem and said bearing-lugs.

40. In combination with an air-brake system, an air-reservoir supplemental to the usual auxiliary reservoir, a valve-casing having a chamber in communication with the supplemental reservoir, auxiliary reservoir, and with a controller, and also having an extension forming a controller-chamber, a valve in said valve-chamber for governing said communication, an operating-lever for said valve, a piston arranged in said controller-chamber and having a stem operatively connected to said lever and a spring against whose tension the piston as well as the valve is moved.

41. In combination with an air-brake system, a supplemental reservoir, a valve device adapted, when adjusted to loaded-car position to connect said reservoir with the usual auxiliary reservoir of the air-brake system, and means for holding the valve device in such adjusted position as long as the brake system of the car is under air-pressure.

42. In combination with an air-brake system, a reservoir supplemental to the usual auxiliary reservoir of the brake system, a valve device adapted, when adjusted to loaded-car position, to connect the two reservoirs whereby the pressure of both are made available to obtain increased braking force and means governed by the pressure of the brake system and co-operating with the valve device to maintain it in such adjusted position during all loaded-car brakings.

43. In combination with an air-brake system, a reservoir supplemental to the usual auxiliary reservoir of the brake system, a valve device adapted, when adjusted to loaded-car position, to connect the two reservoirs and a fluid-pressure-actuated device co-operating with said valve device to maintain it in such adjusted position during all loaded-car brakings.

44. In combination with an air-brake system, a reservoir supplemental to the usual auxiliary reservoir of the brake system, a valve device adapted, when adjusted to loaded-car position, to connect the two reservoirs to obtain increased braking force, and a controller co-operating with the valve device to maintain it in such adjusted position, said valve device itself initially governing said controller.

45. In combination with an air-brake system, a reservoir supplemental to the usual auxiliary reservoir of the brake system, a valve adapted, when adjusted to loaded-car position to connect the two reservoirs and a fluid-pressure-actuated controller co-operating with said valve device to maintain it in such adjusted position, said valve device governing the admission of fluid-pressure to said controller.

46. In an air-brake system, the usual auxiliary reservoir for producing a partial or empty car braking pressure, in combination with a supplemental reservoir for producing a full or loaded car braking pressure, a device adapted to be adjusted to connect said reservoirs and also to bleed the auxiliary reservoir and controlling mechanism for maintaining said device, after adjustment, at a position to connect said reservoirs, said device itself governing the operation of said mechanism.

47. In combination with an air-brake system, a reservoir supplemental to the usual auxiliary reservoir of the brake system, a valve device adapted when adjusted to loaded-car position to connect the two reservoirs and also adapted in another adjusted position to bleed the auxiliary reservoir, and a controller co-operating with the valve device to maintain it in its loaded-car position, said valve device itself initially governing said controller.

48. In an air-brake system for producing light and heavy braking, the combination of a casing having a chamber communicating with the auxiliary reservoir and filled with the air thereof and also having an opening to atmosphere, a supplemental reservoir also communicating with said chamber, and adapted to control said opening to bleed the auxiliary reservoir and also adapted to govern communication between said reservoirs, a spring holding the valve to its seat and maintaining the supplemental

reservoir pressure after the auxiliary-reservoir pressure has been vented from said chamber, and a fluid-pressure controller operatively connected to said valve to hold it in a position for establishing communication between said reservoirs and having a port or passage communicating with said chamber and governed by the said valve.

49. In an air-brake system, an auxiliary reservoir for light braking, a supplemental reservoir adapted to be combined, as to its pressure, with such auxiliary reservoir to produce heavy braking, in combination with a rotary disk valve provided with an operating-stem and adapted to connect or disconnect the two reservoirs, and a spring coiled around the valve-stem and arranged to hold the valve to its seat to thereby maintain the supplemental-reservoir pressure regardless of any decrease in the auxiliary-reservoir pressure.

50. In combination with an air-brake system, means for obtaining in the brake-cylinder a certain braking pressure when a car is empty and capable of adjustment for obtaining in the brake-cylinder a greater or increased braking pressure when the car is loaded, and mechanism governed by the pressure of the brake system for controlling said means and adapted to hold the same to loaded-car position.

51. In combination with an air-brake system, means adapted to produce partial braking pressure for a car empty and manually adjustable for producing a full and increased braking pressure for a car loaded, and mechanism governed by the pressure of the brake system for controlling said means and adapted to hold the same to its adjusted position of loaded-car braking so long as the brake system of the car is under pressure.

52. In combination with the usual air-brake system having a single brake-cylinder, means for producing in said cylinder a partial braking pressure for a car empty and a full or increased braking pressure in said cylinder for a car loaded, and mechanism governed by the pressure of the brake system for controlling said means and adapted to hold the same to loaded-car position.

53. In combination with the usual air-brake system having a single brake-cylinder, means for producing a light braking force for a car empty and a heavy braking force for a car loaded, and mechanism manually adjustable for said heavy braking and controlling said means, said mechanism being arranged to automatically return to light braking position when the air-pressure passes from the brake system.

54. In combination with an air-brake system, means for producing a partial braking pressure for a car empty and full braking pressure for a car loaded and adapted to be adjusted, independently of the pressure of the brake system, to a position for loaded-car braking, and mechanism governed by the pressure of the brake system for controlling said means and adapted to hold the same to loaded-car position.

55. In combination with an air-brake system including the auxiliary reservoir, means for producing a partial braking pressure for a car empty and full braking pressure for a car loaded and mechanism governed by the auxiliary-reservoir pressure for controlling said means.

699,867. CLOCK STRIKING MECHANISM. HENRY H. REED.
Indianapolis, Ind. Filed Feb. 4, 1901. Serial No. 65,311. (No model.)

Claim.—1. In a striking-clock, the combination with a revolvable striking-wheel, and means for rotating said wheel once each minute, of a series of twelve graduated hour-pins carried by said wheel, a series of five graduated ten-minute pins carried by said wheel, a series of nine graduated minute-pins carried by said wheel, a swinging lever, a hammer-lever carried by said lever, a rotatable cam engaging said first lever, means for advancing said cam step by step once each minute, a second lever, a hammer-lever carried thereby and arranged to be engaged by the hour-pin, a cam engaging said third lever, means for advancing said cam step by step once each hour so as to swing said third lever through its range of movement once in twelve hours, and three balls arranged to co-operate with the hammer-levers.

arranged to be engaged by said pins, a ball, and means for swinging said lever as to shift the hammer-lever to vary the number of pins engaging said hammer-lever.

2. In a striking-clock, the combination with a revolvable striking-wheel, of a graduated series of pins carried by said striking-wheel, a lever, a hammer-lever pivoted upon said lever and arranged to be engaged by said pins, a ball, means for swinging said lever as to shift the hammer-lever to vary the number of pins engaging the hammer-lever, and means for carrying said pins past the hammer-lever once each period of time to be indicated.

3. In a striking-clock, the combination with a revolvable striking-wheel, and means for rotating said wheel once during each period of time indicated, of a graduated series of pins carried by said striking-wheel, a lever, a ball mounted upon said lever, a hammer-lever pivoted upon said lever and arranged to be engaged by said pins, and means for swinging said lever as to shift the hammer-lever to vary the number of pins engaging said hammer-lever.

4. In a striking-clock, the combination with a revolvable striking-wheel, and means for rotating said wheel once each minute, of a series of twelve graduated hour-pins carried by said wheel, a series of five graduated ten-minute pins carried by said wheel, three balls, a hammer-lever pivoted upon the first of said levers and adapted to be engaged by the hour-pin, means for swinging said first lever as to vary the number of hour-pins engaging its hammer-lever, a hammer-lever pivoted upon the second lever and adapted to be engaged by the ten-minute pins, means for swinging said second lever as to vary the number of pins engaging its hammer-lever, a hammer-lever pivoted upon the third lever and adapted to be engaged by the minute-pins, and means for swinging said third lever to vary the number of pins engaging its hammer-lever.

5. In a striking-clock, the combination with a revolvable striking-wheel, and means for rotating said wheel once each minute, of a series of twelve graduated hour-pins carried by said striking-wheel, a series of five graduated ten-minute pins carried by said wheel, three balls, one carried by each of said levers, a hammer-lever pivoted upon the first of said levers and adapted to be engaged by the hour-pin, means for swinging said first lever as to vary the number of hour-pins engaging its hammer-lever, a hammer-lever pivoted upon the second lever and adapted to be engaged by the ten-minute pins, means for swinging said second lever as to vary the number of pins engaging its hammer-lever, a hammer-lever pivoted upon the third lever and adapted to be engaged by the minute-pins, and means for swinging said third lever to vary the number of pins engaging its hammer-lever.

6. In a striking-clock, the combination with a revolvable striking-wheel, and means for rotating said wheel once each minute, of a series of twelve graduated hour-pins carried by said wheel, a series of five graduated ten-minute pins carried by said wheel, a lever, a hammer-lever pivoted upon said lever and arranged to be engaged by the minute-pins, a cam arranged to engage the said lever, means for moving said cam as to swing said lever through its range of movement once in each ten minutes, a second lever, a hammer-lever carried by said second lever and arranged to be engaged by the ten-minute pins, a cam engaging said third lever, means for advancing said cam step by step through the range of its movement once each hour, a third lever, a hammer-lever carried thereby and arranged to be engaged by the hour-pin, a cam engaging said third lever, means for advancing said cam step by step once each hour so as to swing said third lever through its range of movement once in twelve hours, and three balls arranged to co-operate with the hammer-levers.

7. In a striking-clock, the combination with a revolvable striking-wheel, and means for rotating said wheel once each minute, of a series of twelve graduated hour-pins carried by said wheel, a series of five graduated ten-minute pins carried by said wheel, a swinging lever, a hammer-lever carried by said lever, a rotatable cam engaging said first lever, means for advancing said cam step by step once each minute, a second lever, a hammer-lever carried thereby and arranged to be engaged by the ten-minute pins, a cam engaging said second lever, a pin-point star-wheel connected to said cam, means for advancing said star-wheel intermittently one-sixth of a revolution each ten minutes, a third lever, a hammer-lever carried thereby in position to be engaged by the hour-pin, a cam arranged to engage said third lever, a twelve-point star-wheel connected to said cam, means carried by said six-point star-wheel for advancing the twelve-point star-wheel once each revolution, and three balls arranged to co-operate with the hammer-levers.

8. In a striking-clock, the combination with a revolvable striking-wheel, and means for rotating said wheel once each minute, of a series of twelve graduated hour-pins carried by said wheel, a series of five graduated ten-minute pins carried by said wheel, three hammer-levers and co-operating

balls, said hammer-levers being arranged to be engaged respectively by the hour-pin, ten-minute pin, and minute-pin in succession, means for changing the relative position of the minute-pin and cooperating hammer-lever once each minute, means for changing the relative position of the ten-minute pin and cooperating hammer-lever five times each hour, and means for changing the relative position of the hour-pin and cooperating hammer-lever once each hour.

8. In a striking-clock, the combination with a revolvable striking-wheel, of a series of twelve graduated hour-pins carried by said wheel, a series of five graduated ten-minute pins carried by said wheel, a series of five graduated minute-pins carried by said wheel, three hammer-levers and cooperating balls, said hammer-levers being arranged to be engaged respectively by the hour-pin, ten-minute pin, and minute-pin in succession, means for carrying said pins past their respective hammer-levers once each minute, means for changing the relative position of the minute-pin and cooperating hammer-lever once each minute, means for changing the relative position of the ten-minute pin and cooperating hammer-lever five times each hour, and means for changing the relative position of the hour-pin and cooperating hammer-lever once each hour.

10. In a striking-clock, the combination with a revolvable striking-wheel, of a driving-wheel 57 geared therewith, a series of five graduated hour-pins carried by said striking-wheel, a series of five graduated ten-minute pins carried by said striking-wheel, a series of five graduated minute-pins carried by said striking-wheel, three hammer-levers and cooperating balls, said hammer-levers being arranged to be engaged respectively by the hour-pin, ten-minute pin, and minute-pin in succession, a cam for shifting the first hammer-lever with relation to the minute-pin, a star-wheel secured to said cam, means carried by the driving-wheel 57 for engaging said star-wheel to advance said cam one step each minute, a second cam secured upon the arbor of the first cam and arranged to shift the position of the second hammer-lever with relation to the ten-minute pin, a star-wheel carried by said second cam, means carried by gear 57 for advancing said second cam one step each ten minutes, a third cam arranged to shift the third hammer-lever with relation to the hour-pin, a star-wheel secured thereto, and means carried by the second star-wheel for engaging the third star-wheel and advancing said third star-wheel one step each hour.

11. In a striking-clock, the combination with a revolvable striking-wheel, of a series of twelve graduated hour-pins carried by said wheel, a series of five graduated ten-minute pins carried by said wheel, a series of five graduated minute-pins carried by said wheel, three levers, three balls, a hammer-lever pivoted upon the first of said levers, and adapted to be engaged by the hour-pin, means for swinging said first lever so as to vary the number of pins engaging its hammer-lever, a hammer-lever pivoted upon the second lever and adapted to be engaged by the ten-minute pin, means for swinging said second lever so as to vary the number of pins engaging its hammer-lever, a hammer-lever pivoted upon the third lever and adapted to be engaged by the minute-pin, means for swinging said third lever so as to vary the number of pins engaging its hammer-lever, and means for carrying the three series of pins past their respective hammer-levers once each minute.

12. In a striking-clock, the combination with a revolvable striking-wheel, of a series of twelve graduated hour-pins carried by said wheel, a series of five graduated ten-minute pins carried by said wheel, a series of five graduated minute-pins carried by said wheel, a lever, a hammer-lever pivoted upon said lever and adapted to be engaged by the minute-pin, a cam arranged to engage the said lever, means for moving said cam so as to swing said lever through its range of movement once each ten minutes, a second lever, a hammer-lever carried by said second lever and arranged to be engaged by the ten-minute pin, a second cam, means for advancing said second cam one step by step through the range of its movement once each hour, a third lever, a hammer-lever carried thereby and arranged to be engaged by the hour-pin, a third cam engaging said third lever, means for advancing said third cam one step by step once each hour so as to swing said third lever through its range of movement once in twelve hours, three balls arranged to cooperate with the hammer-levers, and means for rotating the striking-wheel so as to carry the three series of pins past their respective hammer-levers once each minute.

13. In a striking-clock, the combination with a revolvable striking-wheel, of a series of twelve graduated hour-pins carried by said wheel, a series of five graduated ten-minute pins carried by said wheel, a series of five graduated minute-pins carried by said wheel, three hammer-levers and cooperating balls, said hammer-levers being arranged to be engaged respectively by the hour-pin, ten-minute pin, and minute-pin in succession, means for changing the relative position of the minute-pin and cooperating hammer-lever once each minute, means for changing the relative position of the ten-minute pin and cooperating hammer-lever five times each hour, and means for rotating said wheel so as to carry the three series of pins past their respective hammer-levers once each minute.

14. In a striking-clock, the combination with a revolvable striking-wheel, and means for rotating said wheel once each minute, of a series of twelve graduated hour-pins carried by said wheel, a series of five graduated ten-minute pins carried by said wheel, a series of five graduated minute-pins carried by said wheel, three levers, three balls, a hammer-lever pivoted upon the first of said levers and adapted to be engaged by the hour-pin, means for swinging said first lever so as to vary the number of pins engaging its hammer-lever, a hammer-lever pivoted upon the second lever and adapted to be engaged by the ten-minute pin, means for swinging said second lever so as to vary the number of pins engaging its hammer-lever, a hammer-lever pivoted upon the third lever and adapted to be engaged by the minute-pin, means for swinging said third lever so as to vary the number of pins engaging its hammer-lever, and three pins carried by the striking-wheel in position to engage the three hammer-levers substantially simultaneously in all positions of said levers.

15. In a striking-clock, the combination with a revolvable striking-wheel, and means for rotating said wheel once each minute, of a series of twelve graduated hour-pins carried by said wheel, a series of five graduated ten-minute pins carried by said wheel, a series of five graduated minute-pins carried by said wheel, a lever, a hammer-lever pivoted upon said lever and adapted to be engaged by the minute-pin, a cam arranged to engage the said lever, means for moving said cam so as to swing said lever through its range of movement once each ten minutes, a second lever, a hammer-lever carried by said second lever and adapted to be engaged by the ten-minute pin, a second cam, means for advancing said second cam one step by step through the range of its movement once each hour, a third lever, a hammer-lever carried thereby and arranged to be engaged by the hour-pin, a third cam engaging said third lever, means for advancing said third cam one step by step once each hour so as to swing said third lever through its range of movement once in twelve hours, three balls arranged to cooperate with the hammer-levers, and three pins carried by the striking-wheel in position to engage the three hammer-levers substantially simultaneously in all positions of said levers.

16. In a striking-clock, the combination with a revolvable striking-wheel, and means for rotating said wheel once each minute, of a series of twelve graduated hour-pins carried by said wheel, a series of five graduated ten-minute pins carried by said wheel, a series of five graduated minute-pins carried by said wheel, three hammer-levers and cooperating balls, said hammer-levers being arranged to be engaged respectively by the hour-pin, ten-minute pin, and minute-pin in succession, means for changing the relative position of the minute-pin and cooperating hammer-lever once each minute, means for changing the relative position of the ten-minute pin and cooperating hammer-lever five times each hour, and means for rotating the striking-wheel in position to engage the three hammer-levers substantially simultaneously in all positions of said levers.

17. In a striking-clock, the combination with a revolvable striking-wheel, of a series of twelve graduated hour-pins carried by said wheel, a series of five graduated ten-minute pins carried by said wheel, a series of five graduated minute-pins carried by said wheel, three hammer-levers and cooperating balls, said hammer-levers being arranged to be engaged respectively by the hour-pin, ten-minute pin, and minute-pin in succession, means for carrying said pins past their respective hammer-levers once each minute, means for changing the relative position of the minute-pin and cooperating hammer-lever once each minute, means for changing the relative position of the ten-minute pin and cooperating hammer-lever five times each hour, and means for changing the relative position of the hour-pin and cooperating hammer-lever once each hour, and three pins carried by the striking-wheel in position to engage the three hammer-levers substantially simultaneously in all positions of said levers.

18. In a striking-clock, the combination with a revolvable striking-wheel, of a driving-wheel 57 geared therewith, a series of twelve graduated hour-pins carried by said striking-wheel, a series of five graduated ten-minute pins carried by said striking-wheel, a series of five graduated minute-pins carried by said striking-wheel, three hammer-levers and cooperating balls, said hammer-levers being arranged to be engaged respectively by the hour-pin, ten-minute pin, and minute-pin in succession, a cam for shifting the first hammer-lever with relation to the minute-pin, a star-wheel secured to said cam, means carried by the driving-wheel 57 for engaging said star-wheel to advance said cam one step each minute, a second cam secured upon the arbor of the first cam and arranged to shift the position of the second hammer-lever with relation to the ten-minute pin, a star-wheel carried by said second cam, means carried by gear 57 for advancing said second cam one step each ten minutes, a third cam arranged to shift the third hammer-lever with relation to the hour-pin, a third star-wheel secured thereto, means carried by the second star-wheel for engaging the third star-wheel and advancing said third star-wheel one step each hour.

wheel one step each hour, and three pins carried by the striking-wheel in position to engage the three hammer-levers substantially simultaneously in all positions of said levers.

699,888. **STRAKER**. STRAKER, BOSTON, Massachusetts, England. Assignor of one-half to Charles A. Gould, New York, N. Y. Filed Dec. 18, 1901. Serial No. 95,492. (No model.)

Claim.—1. The combination of an armature, a field magnet or magnets movably mounted and adapted to follow the armature and means for maintaining a substantially constant difference of speed between the armature and field magnet or magnets, substantially as set forth.

2. The combination of an armature, a field magnet or magnets movably mounted and adapted to follow the armature, a governor movable with the field magnet or magnets, gearing between said governor and the armature, and means actuated by said governor for controlling the movement of the field-magnet, substantially as set forth.

3. The combination of an armature, a field magnet or magnets movably mounted and adapted to follow the armature, a governor movable with the field magnet or magnets, gearing between said governor and the armature, a fixed brake-surface, and a brake held in contact with said brake-surface and controlled by said governor, substantially as set forth.

4. The combination of an armature, a field magnet or magnets movably mounted and adapted to follow the armature, a commutator, brushes carried by the field magnet or magnets and connecting with said commutator, collecting-rings carried by said magnet or magnets and electrically connected with said brushes, fixed brushes connecting with said collecting-rings, and governing means for maintaining a substantially constant difference of speed between the armature and the field-magnet, substantially as set forth.

5. The combination of an armature-shaft, an armature fixed thereon, a frame journaled on the armature-shaft, a field magnet or magnets carried by said frame, a governor carried by said frame, gearing connecting said armature-shaft and governor, a fixed brake-ring, a brake-shoe carried by said frame and bearing against said brake-ring, and a connection between said governor and brake-shoe for controlling the same, substantially as set forth.

6. The combination with an armature and a field magnet or magnets movably mounted and adapted to follow the armature, a governor movable with the field magnet or magnets, a switch movable with said field magnet or magnets and controlled by said governor, and electrical connections between the armature and said switch, substantially as set forth.

7. The combination with an armature, a field magnet or magnets movably mounted and adapted to follow the armature, and means for maintaining a substantially constant difference of speed between the armature and the field magnet or magnets, of an external circuit, current-collecting means including brushes arranged to maintain a constant position relative to said field magnet or magnets, and a reversing-switch and connection for maintaining a constant direction of current in said external circuit, substantially as set forth.

8. The combination with an armature, and a field magnet or magnets movably mounted and adapted to follow the armature, of a commutator, brushes thereon carried by the field magnet or magnets, collector-rings each electrically connected with one of said brushes, fixed brushes for said collector-rings, an external circuit connecting with said fixed brushes, and a reversing-switch and connection for maintaining a constant direction of current in said external circuit, substantially as set forth.

9. The combination with a dynamo, of a device rotated by the dynamo-shaft, an oscillating device adjacent to said rotary device, a pawl pivoted to a fixed part and connected to said oscillating device, means tending to hold said pawl in a central position, said rotary device adapted to engage said pawl and shift the same to opposite sides of said central position when said rotary device is oppositely rotated, and contacts controlled by said oscillating device, substantially as set forth.

10. The combination with a dynamo, of a collar fixed to the dynamo-shaft, an oscillating ring adjacent to said collar, a pawl pivoted to a fixed part and connected to said oscillating ring, means tending to hold said pawl in a central position, said collar adapted to engage said pawl and shift the same to opposite sides of said central position when the collar is oppositely rotated, and contacts carried by said oscillating ring and cooperating with fixed contacts, substantially as set forth.

no-shaft, an oscillating ring adjacent to said collar, a pawl pivoted to a fixed part and connected to said oscillating ring, means tending to hold said pawl in a central position, said collar adapted to engage said pawl and shift the same to opposite sides of said central position when the collar is oppositely rotated, and contacts carried by said oscillating ring and cooperating with fixed contacts, substantially as set forth.

699,889. **TYPE-WRITING MACHINE**. HAROLD JARVIS, Buffalo, N. Y. Assignor to Jarvis Type-writer & Tabulator Company, Buffalo, N. Y. Filed July 2, 1901. Serial No. 95,493. (No model.)

Claim.—1. In a type-writing machine, the combination with a paper-carriage and a stop-by-stop feed mechanism therefor, the carriage being capable of disconnection from said feed mechanism, and a speed-governor comprising a governor-shaft, a driving-shaft from which said governor-shaft is driven and which is movable into and out of gear therewith, and gearing between the carriage and said driving-shaft for rotating the latter by the movement of the carriage, substantially as set forth.

2. In a type-writing machine, the combination with a paper-carriage having a gear-rack, of a speed-governor comprising a governor-shaft having a pinion, and a driving-shaft movable toward and from said governor-shaft and having gear-wheels arranged to engage with said gear-rack and the pinion of the governor-shaft, substantially as set forth.

3. In a type-writing machine, the combination with a paper-carriage, of an escapement therefor, one member of which consists of a vertically-movable gear-rack mounted on the carriage and capable of engaging and having the other member, a governor-shaft, a vertically-movable driving-shaft from which said governor-shaft is driven and which is movable into and out of gear therewith, said driving-shaft having a pinion which engages with the toothed lower edge of said gear-rack, substantially as set forth.

4. In a type-writing machine, the combination with a paper-carriage and an escapement therefor having a pinion, of a vertically-movable gear-rack mounted on said carriage and capable of moving into and out of gear with said pinion, and a speed-governor comprising a vertically-movable driving-shaft geared with said gear-rack and having a gear-wheel, and a governor-shaft arranged above said driving-shaft and having a pinion arranged to mesh with the gear-wheel thereof when the driving-shaft is raised, and means for elevating said driving-shaft, substantially as set forth.

5. In a type-writing machine, the combination with a paper-carriage having feed mechanism from which it can be disconnected, of a governor-shaft, a vertically-movable frame or support arranged below the plane of said governor-shaft, a driving-shaft for said governor-shaft journaled in said frame, a driving means connecting said driving-shaft with the paper-carriage, a series of auxiliary levers, and lifting devices for said vertically-movable shaft-frame which are operated by said levers, substantially as set forth.

699,890. **TYPE-CONTAINING CHAIN**. LOUIS E. JOHNSON and ALBERT A. LOW, Brooklyn, N. Y. Assignors to Alden Type Machine Company, New York, N. Y. Filed Apr. 12, 1902. Serial No. 12,578. (No model.)

Claim.—1. The type-containing channel C, formed with the pusher-dot c' , with the lateral openings c'' , in its side walls, and with the spring-latches L, the whole arranged and operating substantially as set forth.

2. The combination of a type-containing channel formed with perforated spring-latches and a clag having a spring-bolt for engagement with said latches, substantially as herein set forth.

3. The combination of the type-containing channel C, the latches L, formed with abutted ends l' , l'' , and perforations l' , l'' , and the clag S, formed with the spring-bolt s , for engagement with said spring-latches substantially as described.

4. The combination of a type-containing channel C, having a spring-act L, formed with a perforation l' , and a type-clag S, formed with a spring-bolt s , for engagement with said spring-latch, substantially as described.

699,891. GOLF-CLUB HOLDER. WILLIAM E. JOHNSON, Haverhill, Mass. Filed May 20, 1901. Serial No. 69,970. (No model.)

Claim.—1. A portable golf-club holder comprising in combination a base provided with means for receiving the handle ends of a series of clubs, a rod rigidly secured to said base at its center, a head rigidly secured to said rod above the base and provided with means for detachably engaging the shafts of said clubs, and holding the same in proximity to said rod, and a handle secured to said rod between the base and head and projecting outward therefrom between and beyond said clubs.

2. A portable golf-club holder comprising in combination a base provided on its top with a series of sockets, a rod rigidly secured to said base at its center, a head rigidly secured to said rod above the base and provided with a series of sockets corresponding to the sockets in said base and adapted respectively to detachably receive the shaft of a club, and a handle secured to said rod between the base and head and projecting outward therefrom between and beyond said clubs.

3. In a device of the character described, the combination of a base having a double bottom forming a compartment as described, means for obtaining access to said compartment, means carried by the top of said base for receiving the handle ends of a series of clubs, a head provided

with means for detachably engaging the shafts of said clubs, and a rod connecting said head and base.

4. In a device of the character described, the combination of a base provided with a series of sockets, a head provided with means for detachably engaging the shafts of a series of clubs, a rod connecting said head and base, a spring varied by said rod, and a handle rigidly connected to said spring.

5. In a device of the character described, the combination of a rod, a blade or spike adapted to slide lengthwise of the same, a handle connected to said blade or spike, and means carried by said rod for detachably holding a series of clubs.

6. In a device of the character described, the combination of a base, a hollow rod passing through the center thereof, a head carried by said rod, means for detachably securing a series of clubs to said head and base, a blade or spike adapted to slide within said rod and to be projected below the bottom of said base, and a handle secured to said blade or spike.

7. In a device of the character described, the combination of a base provided with a series of sockets, a head provided with means for detachably engaging the shafts of a series of clubs, rigid connections between said head and base, a blade or spike mounted to slide past the bottom of said base, and a handle rigidly secured to said spike.

8. In a device of the character described, the combination of a base, a hollow rod secured to said base and having a slot in its side, a head carried by said rod, means for detachably securing a series of clubs to said head and base, a blade or spike arranged to slide within said rod, a handle mounted to slide upon the exterior of said rod, and connections passing through said slot for rigidly uniting said handle and spike.

9. In a device of the character described, the combination of a rod provided near its upper end with a head and means carried thereby for detachably engaging the shafts of a series of clubs, two disks 6 and 11 carried by said rod near its lower end and spaced apart, as described, the upper disk being provided with a series of recesses forming sockets, a disk 7 secured to said rod below said disks 6 and 11, and a strip of flexible material secured to the edges of said disks along a portion of their peripheries and left unsecured thereto for the remainder of its length, and means for detachably fastening the free end of said strip to the secured portions thereof, for the purpose set forth.

10. In a device of the character described, the combination of a rod provided with means for detachably engaging the shafts of a series of clubs, two disks carried by said rod and spaced apart to form the top and bottom of a compartment, a series of sockets located above the top disk and open at their outer edges, and a strip of flexible material secured to the edges of said disks and extending above the top disk, thereby forming a compartment in connection with said disks and also serving to prevent the outward displacement of the club-handles, substantially as set forth.

699,892. RACKER FOR SUPPORTING BED-BOTTOMS. FRANK KARR, Holland, Mich. Filed Jan. 23, 1901. Serial No. 69,125. (No model.)

Claim.—1. In combination with a bed-bottom having angle-iron frames and a bedstead having angle-iron rails, a hanger the body of which is bent at opposite right angles, the upper angle-arm having a retaining-lip at the end and the lower angle-arm bent upward and then bent over and parallel with the arm and forming a receptacle for the web of the rail of the bed-bottom, substantially as and for the purpose set forth.

2. In combination with a bedstead and bed-bottom, each having side rails formed of angle-iron, a hanger the body of which is bent at opposite right angles, the upper angled arm projecting over the bed-rail and having a retaining-lip at the end, and the lower angled arm projecting under the bed-bottom rail and bent upward and then bent parallel with the arm and forming a receptacle for the web of the rail of the bottom, and a bolt passing through said rail and arm, substantially as and for the purpose set forth.

699,893. TIME-INDICATOR FOR PHOTOGRAPHER. JOHN KIMMER, Jr., Brooklyn, N. Y. Filed May 27, 1901. Serial No. 70,566. (No model.)

Claim.—1. In a photograph instrument, the separately-formed plate D and posts D' D' one carrying a graduated scale and the other a pivot, in combination with the lower-IP and means for actuating the latter, as

ording as the speed-timing device is adjusted, all substantially as herein specified.

2. In a photograph instrument, a speed-regulating screw arranged to serve its usual ends, in combination with a scale and with an unequally-divided indicating-lever having its short arm actuated by the longitudinal motion of said screw and its long arm moving over said scale, substantially as herein specified.

3. In a photograph instrument the graduated scale D' in combination with the index IP carried on a separate plate D' IP' with the screw O O' for conveniently attaching and detaching, and means for actuating the index according as the timing device is moved, and means as the screw O' for adjusting the supporting-pivot E of the index so that the indications may be varied as required for different instruments, all substantially as herein specified.

699,894. GASKET-PRESSURE MECHANISM. JOHN G. KIMM, Oshkosh, Ind. Filed June 12, 1901. Serial No. 69,112. (No model.)

Claim.—1. A gasket-feeding mechanism including a valve-rod having fixed opening lower sides the upper and lower portions of which slope at different degrees of angularity toward the ends of the case terminating at inlet and outlet openings having fixed cones, any yielding valve-seats of the openings, and a valve confined between the said upper and lower portions and limited in its travel by the any yielding valve-seats.

2. A gasket-feeding mechanism comprising a valve-rod the lower portion of which is in the form of a funnel having any yielding relatively long straight sloping sides approaching the perpendicular in degree of angularity and the upper portion of which is in the form of an inverted funnel having any yielding relatively short sloping sides approaching the horizontal in degree of angularity, a valve comprising conical ends having straight faces differing in degree of angularity, the angularity of the lower portion of the valve corresponding substantially to the angularity of the lower portion of the case and the angularity of the upper portion of the valve differing from the angularity of the upper portion of the case, the valve being confined operatively in the case, and means for the valve.

3. In a gasket-gas generator, the combination with a water-tank, of a valve-rod having two opposing valve-seats and an enlarged space between the two seats, a hopper communicating with the top of the valve-rod, a guide in the hopper, a guide below the valve-seats, a valve adapted to move partially through the orifices at the valve-seats and having a guide-stem engaging the said guides, said valve having an enlarged portion intermediate of the ends thereof at either side of which it is adapted to engage one of said seats, a push-bar for the valve, a weight for depressing the valve, and means for operating the push-bar.

4. In a gasket-gas generator, the combination of the water-tank, the gate-valve, the receiver secured immovably to the water-tank, the valve-rod attached to the receiver and having the upper valve-seat and the opposing lower valve-seat, the valve having the oppositely-disposed conical ends adapted to engage said seats and having the guide-stem attached to the ends thereof, the guides engaging said stems, the weighted operating-stem connected to said guide-stem, the guide attached to said tank and having the push-bar mounted therein, the lever engaging said push-bar, the coupling-rod connected to said lever, the gasometer-tank, the gasometer-bell operatively engaging said coupling-rod, the gas-pipe extending from the receiver into the bell, and the hopper at the top of the valve-rod communicating therewith, substantially as set forth.

699,895. METHOD OF PROTECTING FILMS. WHITTAKER & KRYER, San Francisco, Cal. Filed Sept. 27, 1901. Serial No. 70,000. (No specimens.)

Claim.—1. A method of protecting films, lenses and the like, which consists in coating the surface of said films or lenses with hydrocarbon products to form a tough viscous covering.

2. A method of protecting films, lenses and the like from greases and the like, which consists in coating the surface of said films or lenses with crude petroleum to form a hard crust.

3. A method of protecting carbon films, lenses and the like which consists in coating the surface of the film or lens with broken rock, gravel or sand and applying a hydrocarbon compound such as crude petroleum to said coating to form a tough impervious crust or surface that will resist the action of the water and gases dissimilar to solvents.

699,896. HYDRAULIC MOTOR. FRANK KARR, Holland, Ohio. Filed Sept. 20, 1901. Serial No. 70,715. (No model.)

Claim.—In a hydraulic motor, the combination with an oscillating cylinder and valve-chest supported upon tubular trunnions forming inlet and outlet passages, said cylinder having a piston and its rod and inlet and outlet ports, of a rocking valve having a lever projecting from the stem thereof, a trip-plate to throw the valve, and operative connections between the piston-rod and the trip-plate comprising a slotted rod, a pin on the plate projecting into the slot, and an oscillating lever to which the piston-rod and slotted rod are pivotally connected.

699,897. FIRE-BOOM. ANDREW E. LAMY, Washington, D. C. Filed Sept. 2, 1901. Serial No. 74,300. (No model.)

Claim.—1. A fire-boom provided with an offsetting vane or wing to curve as a hydroplane and impart a forward movement to the boom when the line receives a smart pull or jerk, substantially as set forth.

2. A fire-boom having a vane or wing extended rearwardly therefrom in a diametrically opposite direction to the point to provide a hydroplane to cause the boom to spring forward, simultaneously with a quick pull or jerk upon the line, substantially as specified.

3. A fire-boom having a rearwardly-extended vane of greater transverse extent than the body of the boom and rigid therewith and adapted to receive the reacting influence when the line is quickly drawn upon to impel the boom forward, substantially as set forth.

4. A fire-boom having an end portion of the wire from which it is formed rearwardly bent and transversely flattened to provide a vane or hydroplane for the reacting action of the water to cause a forward spring of the boom when the line is quickly drawn upon or jerked, substantially as set forth.

5. A fire-boom having an end portion bent to provide an eye and rear extension, which latter is transversely flattened to form a vane or hydroplane, substantially as and for the purpose set forth.

6. A fire-boom having an end portion rearwardly bent and robust and flattened to form a vane or hydroplane, substantially as and for the purpose set forth.

699,898. CONNECTING DEVICE. IRVING LAMM, Chicago, Ill., assignor of one-half to Robert G. Armstrong, Chicago, Ill. Filed Aug. 31, 1901. Serial No. 73,748. (No model.)

Claim.—1. The combination with two interlocking members one embracing a loop and the other a locking-plate, said plate being provided on its outer margin with a rearwardly-opening notch adapted to engage the end of said loop and at its inner margin with a projection which is adapted to be interlocked with a projection carried by the other member, one of the said projections being spring-pressed, to permit said members to be locked and unlocked.

2. The combination with two interlocking members one embracing a loop and the other a locking-plate, said plate being provided on its outer margin with a rearwardly-opening notch adapted to engage the end of said loop and at its inner margin with a projection which is adapted to be interlocked with a projection carried by the other member, one of said projections being spring-pressed to permit said members to be locked and unlocked, said members having abutting parts which are brought into contact when said members are locked to prevent said members being moved to past their locking positions.

3. The combination with two interlocking members one embracing a loop and the other a locking-plate adapted to enter said loop, said locking-plate being made of such width as to engage both side members of the loop, said plate being provided (a) its outer margin with a rearwardly-opening notch which engages the end of the loop and at its inner margin with a projection which is adapted for interlocking engagement with a projection carried by the other member, one of said projections being spring-pressed to permit said members to be locked and unlocked.

4. The combination with two interlocking members one embracing a loop and the other a locking-plate adapted to enter said loop, said locking-plate being made of such width as to engage both side members of the loop, said locking-plate being provided on its outer margin with a rearwardly-opening notch which engages the end of the loop and at its inner margin with a projection adapted for interlocking engagement with a projection carried by the other member, one of said interlocking parts being spring-pressed to permit the members to be locked and unlocked, and parts on said members which are in contact when said members are locked to prevent said members being moved beyond their locking positions.

5. The combination with two interlocking members one embracing a loop and the other a locking-plate adapted to enter said loop, said plate being provided on its outer margin with a rearwardly-opening notch adapted to engage the end of the loop, one of said parts being provided with a barrel, an endwise-reciprocating spring-pressed plunger riding in said barrel, and a spring interposed between the outer end of said plunger and the end of the barrel, and the other part being provided with a shoulder adapted for interlocking engagement with the plunger.

6. The combination with two interlocking members one embracing a loop and the other a locking-plate adapted to enter said loop, said plate being provided on its outer margin with a rearwardly-opening notch adapted to engage the end of the loop, one of said parts being provided with a barrel, an endwise-reciprocating spring-pressed plunger in said barrel and a spring interposed between the outer end of said plunger and the end of the barrel, and the other part being provided with a shoulder adapted to have interlocking engagement with the plunger, and means for moving said plunger endwise comprising a pin which enters a transverse aperture in said plunger and extends outwardly through a slot in the wall of the barrel.

7. The combination with two interlocking members one embracing a loop and the other a locking-plate, said plate being provided in its outer margin with a rearwardly-opening notch which engages the outer end of the loop, and a spring-pressed plunger on the loop member the inner end of which enters said loop, said locking-plate being provided on its inner margin with a shoulder adapted to engage the plunger to hold the members in their locked position.

699,899. CLASH-GUTTER. IRVING LAMM, New York, N. Y. Filed Nov. 11, 1901. Serial No. 81,707. (No model.)

Claim.—1. A dash-cutter comprising a reliable base, a standard spring from the base, a cam-structure supported on the standard and including a motor for driving the shaft, a knife, a guide for holding the knife against lateral vibration during its reciprocating movement and opening through the walls of the guide, the bottoms of said openings having

an upward and inward inclination toward the opposite sides of the knife for relieving the knife from clogging material, substantially as set forth.

2. The combination with the knife having its upper end perforated, of a plunger or connecting-rod provided with dovetail-pieces arranged to enter the perforations in the knife and a removable clamping-piece under the control of a screw for locking the knife to the plunger, substantially as set forth.

3. The combination with a knife having its upper end perforated and notched, of a plunger provided with pins arranged to enter the perforations in the upper end of the said knife, a screw adapted to enter the notch in said knife and a movable clamping-piece under the control of the screw for locking the parts in assembled adjustment, substantially as set forth.

4. The combination with a knife having its upper end perforated and notched, of a plunger provided with pins arranged to enter the perforations in the knife, a movable clamping-piece and a screw provided in said movable clamping-piece in position to engage the notch in the knife for holding the parts in assembled adjustment, substantially as set forth.

5. The combination with a knife having its upper end perforated and notched, of a plunger having its lower end perforated, a movable clamping-piece provided with pins arranged to move together with the pins into and out of engagement with the perforations in the knife and a clamping-screw provided to said movable clamping-piece and engaged with the plunger for locking and releasing the parts, substantially as set forth.

6. A dash-cutter comprising a reliable base, a standard spring therefrom, a casing supported on said standard, said casing being divided into compartments, one of said compartments serving to house an electric motor and another of said compartments containing therein an eccentric, a gear-wheel fixed to rotate with the eccentric, a pinion on the motor-shaft in engagement with said gear-wheel, an eccentric-clip engaged with the eccentric and a plunger connected with said clip and extending through the bottom of the casing, the latter serving as a guide for the plunger, a knife attached to the lower end of the plunger and having a reciprocating movement along said spring standard and a handle, connected with the casing for manipulating the cutter, substantially as set forth.

699,400. SPRING-POST FOR MOTOYS SEATS OR HANDS. BAKER GREEN & LLOYD, Chicago, Ill. Filed Dec. 9, 1901. Serial No. 85,188. (No model.)

Claim.—1. In a spring-post for bicycles, the combination with a longitudinally-elastic, tubular part, of a coupling-rod limiting the longitudinal expansion of said post, an internal expander-peg, a screw threaded therein to raise and lower said plug, means for operating said screw by rotation of said coupling-rod, and means for limiting the movement of said screw to that of rotation only.

2. In a spring-post for bicycles, the combination with a longitudinally-elastic, tubular part, of a coupling-rod therein to limit the distance of longitudinal expansion, an expander-peg, a screw threaded therein to raise and lower said plug, internal means for rotating said rod, connecting means between said rod and screw to rotate said screw, and means for limiting the movement of said screw to that of rotation only.

3. In a spring-post for bicycles, the combination with a longitudinally-elastic, tubular part, of a coupling-rod limiting the longitudinal expansion of said post, an expander-peg, a screw threaded therein to operate said plug, external means for rotating said coupling-rod, connecting means between said rod and screw to rotate said screw, means for limiting the movement of said screw to that of rotation only, and means for varying the resiliency of said spring.

4. In a spring-post for bicycles, the combination with a longitudinally-elastic, tubular part, of a coupling-rod limiting the longitudinal expansion of said post, a screw-controlled, expander-peg operable by rotation of said coupling-rod, and connecting means between said rod and screw for varying the resiliency of said spring.

5. In a spring-post for bicycles, the combination with a longitudinally-elastic, tubular part, of a screw-controlled, internal expander-peg, a coupling-rod limiting the longitudinal expansion of said post, connecting means between said screw and rod to operate said screw by rotation of said rod, and means for varying the length of said coupler to increase or diminish the resiliency of said spring.

6. In a spring-post for bicycles, the combination with a longitudinally-elastic, tubular part, of a coupling-rod limiting the longitudinal expansion of said post, an expander-peg, a screw threaded therein to operate said plug, external means for rotating said coupling-rod, connecting means between said rod and screw to rotate said screw, means for limiting the movement of said screw to that of rotation only, and means for varying the length of said coupler to increase or diminish the resiliency of said spring.

7. In a spring-post for bicycles, the combination with a longitudinally-elastic, tubular part, of internal expander-peg, means for preventing rotation of said plug, a screw threaded therein to raise and lower said plug, means for limiting the movement of said screw to that of rotation only, a coupling-rod limiting the longitudinal expansion of said post, said rod being freely slidable longitudinally through said screw and rotatable to operate said screw, and means for varying the length of said coupling-rod.

699,401. REINFORCING DEVICE. WILLIAM F. LOYD, East Orange, N. J. Filed Feb. 6, 1902. Serial No. 85,571. (No model.)

Claim.—1. An anchor comprising two parts each having a handle, the two parts having an inextensible swiveling connection and also connected by elastic means constructed to afford tensile resistance to the swiveling movement.

2. An anchor comprising two parts each having a handle and a cross-bar connected together, the two cross-bars having a swiveling connection and also connected by elastic means constructed to afford tensile resistance to the swiveling movement.

3. An anchor comprising two parts each having a cross-bar suitably connected together, the two cross-bars having an inextensible swiveling connection and also connected by elastic means constructed to afford tensile resistance to the swiveling movement.

4. An anchor comprising two parts each having a handle, a pivot-pin connecting the two parts together with a swiveling connection, and elastic tension devices also connecting the parts together.

5. An anchor comprising two parts each having a handle and a cross-bar connected together, a pivot-pin connecting the two cross-bars together with a swiveling connection, and elastic tension devices also connecting the cross-bars together.

6. An anchor comprising two parts each having a handle and a cross-bar suitably connected together, a pivot-pin connecting the two cross-bars together with a swiveling connection, and elastic tension devices also connecting the cross-bars together.

7. In an anchor, in combination, two cross-bars, a pivot-pin connecting them together with a swiveling connection, elastic tension devices also connecting the cross-bars together, and two handles, one for each cross-bar, each handle being mounted upon a ball pivotally connected to its corresponding cross-bar.

8. In an anchor, in combination, two cross-bars, a pivot-pin suitably connecting them together with a swiveling connection, elastic tension devices connecting the cross-bars together in proximity to the ends of the cross-bars, and two handles, one for each cross-bar, each handle being axially rotatably mounted upon a ball pivotally connected to its corresponding cross-bar, substantially as set forth.

699,402. TYPE-DISTRIBUTING APPARATUS. ADOLF A. LOW and JAMES BRADLEY, Brooklyn, N. Y., assignors to Alden Type Machine Company, New York, N. Y. Filed Aug. 28, 1901. Serial No. 73,380. (No model.)

Claim.—1. In a device for forwarding lines of type, the combination of the vertical type-channel V, the abutment B, the reciprocating line-forwarder L, the rotatable wheel F, the driving-worm W, the cam K, the rocker R and the link S, the whole arranged and operating substantially in the manner and for the purpose set forth.

2. In a device for forwarding lines of type, the combination of the vertical distributer-channel V, formed with the vertical slot, the abutment B, the rotatable wheel F, the driving-worm W, the cam K, the rocker R, the link S, and the reciprocating line-forwarder L, the whole arranged and operating substantially in the manner and for the purpose set forth.

699,403. VEHICLE-BODY RAISER. WILLIAM HARRIS, Reed City, Mich. Filed July 28, 1901. Serial No. 78,388. (No model.)

Claim.—In a wagon-body lifter a reliable supporting-frame, movable beams, links connecting the movable beams to the supporting-frame bottom projecting from the beams, supporting-arms extending from one beam to the other, the ends of one of said arms engaging the bottom, beams carried by a wagon-body and embracing the tops of a wagon-body whereby the movement of the raising-gear in either direction is communicated to the body.

699,404. FREIGHTS CHAIR. SUMNER S. McNEILL, Chicago, Ill.; Anna S. McNeill, administratrix of said Sumner S. McNeill, deceased, assignors of one-half to Jacob P. Repp, Chicago, Ill. Filed Nov. 2, 1900. Serial No. 86,718. (No model.)

Claim.—1. A printer's chase comprising the corner-pieces, and the detachable side and end bars connecting said corner-pieces and forming therewith a rigid rectangular frame; said corner-pieces and bars being separable only when oppositely moved transversely to a plane extending through all of said sections, and each of said corner-pieces having one of its ends for attachment to said bars further removed from the corner than its other end for attachment to said bars, substantially as described.

2. A printer's chase comprising the corner-pieces, and the detachable side and end bars connecting said corner-pieces and forming therewith a rigid rectangular frame; said corner-pieces and bars being separable only when oppositely moved transversely to a plane extending through all of said sections; said bars having all of their attaching ends of uniform shape and size, and said corner-pieces each having their attaching parts formed oppositely to said attaching ends and adapted for receiving and securing any of said attaching ends and each of said corner-pieces having one of its attaching parts located further from the corner than its other attaching part, substantially as described.

3. A printer's chase comprising the corner-pieces, and the detachable side and end bars connecting said corner-pieces and forming therewith a rigid rectangular frame; said corner-pieces and bars being separable only when oppositely moved transversely to a plane extending through all of said sections; said bars having at each end a dovetail in the form of a truncated wedge with trapezoidal base, and said corner-pieces having mortises fitting said dovetails, and all of said dovetails being of uniform size and shape, and adapted to similarly fit in any of said mortises, each of said corner-pieces having one of its mortises located further from the corner than its other mortise, substantially as described.

699,405. SAND-MASS. RAY E. NEWBORN, Columbus, Ohio.
Filed Dec. 10, 1901. Serial No. 28,300. (No model.)

Claim.—1. A sand-blast comprising a casing, frusto-conical partitions arranged within the casing at different points and forming upper and lower sand-chambers, a blast-pipe connected with the lowermost partition, valves arranged at the other partitions, an air-supply pipe connected with the blast-pipe and with the individual chambers, and means for connecting the chambers and the air-supply pipe individually or simultaneously, substantially as described.

2. A sand-blast comprising a casing, upper, lower and intermediate frusto-conical partitions arranged within the casing and forming upper and lower sand-chambers, a blast-pipe connected with the lower partition,

valves arranged at the other partitions, shafts provided with rockers for engaging the valves and having exterior means for operating them, an air-supply pipe connected with the blast-pipe and with the individual chambers, and means for connecting the chambers and the air-supply pipe individually or simultaneously, substantially as described.

3. A sand-blast comprising a casing having upper and lower sand-chambers, a blast-pipe connected with the lower chamber to receive sand therefrom, an air-supply pipe connected with the blast-pipe and with the individual chambers, and means for connecting the chambers and pipe individually or simultaneously with the air-pipe.

4. A sand-blast comprising a casing having upper and lower sand-chambers, a blast-pipe connected with the lower chamber to receive sand therefrom, an air-supply pipe, a pipe leading from the air-supply pipe to the blast-pipe, a pipe connecting the air-supply pipe with the lower chamber, a pipe connecting the air-supply pipe with the upper chamber, a valve for connecting the receiving-chamber or upper chamber with its pipe to equalize pressure in the chambers, and a valve for connecting the pipes of the chambers or the pipe of the blast-pipe individually or simultaneously with the air-supply pipe.

699,406. VOTE-COUNTING FRAME. THOMAS C. OGDENSTY,
Worcester, Mass. Filed Feb. 20, 1902. Serial No. 25,725. (No model.)

Claim.—1. A vote-counting frame, consisting of a frame proper of a width not less than the length of the ballot, and lines or cords secured to and extending across between the sides of the frame parallel with one another and at intervals apart about equal to the width of the *m* or vote-mark column of the ballot, substantially as and for the purposes hereinbefore set forth.

2. A vote-counting frame consisting of a frame proper of a width not less than the length of the ballot, lines or cords extending across between and secured to the sides of the frame parallel with one another and at intervals apart about equal to the width of the *m* or vote-mark column of the ballot, mortises in the interior opposite edges of the ends of the frame, and two rules or blading-strips adapted to be sprung into said mortises, substantially as and for the purposes hereinbefore set forth.

699,407. MAIL-SERVICE APPARATUS. GEORGE A. OWEN,
Springfield, Mass. Filed Mar. 12, 1900. Serial No. 732,002. (No model.)

Claim.—1. In a mail-service apparatus, in combination with the post-office having mail-receiving chutes with upwardly-opening ends, the conveyor for delivering sorted mail into said chutes, of an elevator having series of compartments to which the chutes respectively lead, adapted to be elevated in a building, and receiving chutes or passages into which the sorted mail from the said elevator is respectively delivered.

2. In a mail-service apparatus in a building, the series of chutes all having adjacent series of receiving-mouths at an upper floor in the building, the several series of such successively being downwardly extended to different floors as described, in combination with an elevator having series of mail-compartments corresponding to the said series of chutes and means for elevating said elevator for delivery opposite the mouths of the several chutes.

3. In a mail-service apparatus, a building having a series of chutes all having adjacent receiving-mouths at an upper part of the building, the several series of such leading downwardly to the lower stories and having lock-boxes at their lower terminals, in combination with the elevator normally located at a lower part of the building and adapted to be elevated to a position opposite the mouths of the several series of chutes, and having compartments corresponding in number and arrangement to as to register with said mouths, substantially as described.

4. In a mail-service apparatus, a building having a series of chutes all having adjacent receiving-mouths at an upper part of the building, the chutes of the several series leading downwardly to the successively lower stories and extended to within different apartments in the building as described, in combination with the elevator having the several series of mail-receiving compartments, normally located at a lower part of the building

and adapted to be elevated to a position opposite the mouths of the several series of chutes, substantially as described.

5. In a mail-service apparatus, in combination with the post-station having mail-receiving chutes with upwardly-opening ends, the conveyor for delivering assorted mail into said chutes, of an elevator having series of compartments to which the chutes respectively lead, adapted to be elevated in a building, receiving chutes or passages into which the assorted mail from the said elevator is respectively delivered, and means operated by the movable conveyor for elevating said elevator.

6. The combination with the elevator and means by which it is elevated in a building, of the series of chutes 182 having open mouths at the upper ends thereof corresponding to compartments which are provided in said elevator, said chutes extending from their mouths in a downwardly-inclined direction, and terminating in letter-boxes at their lower ends.

7. In a mail-service apparatus, of the character described, the combination with the elevator having the series of compartments 164 the partitions of which are obliquely arranged, of a series of chutes in a building having their upper ends open and in arrangement to register with that of said compartment, said chutes being extended from their mouths inclining downward and continued to within separate apartments in the building, substantially as described.

8. In a mail-service apparatus, in combination with the post-station having the series of chutes 182, the elevator 165 having compartments to which said chutes lead, the trackway and the conveyor movable thereon, an elevating-cable connected to said elevator 165, a movable part longitudinally sliding on the trackway to which said cable is connected and provided with an abutment, a movable device provided on the elevator adapted to engage said abutment, and means for tripping said engaging device, after a given movement of the elevator in its forward direction sufficient for elevating the said elevator, substantially as described.

9. In a mail-service apparatus of the character described, the combination with the post-station having series of upwardly-open chutes, the trackway 155 having the cam or incline 179 and having, longitudinally movable along said trackway, the sleeve 175 provided with the stud 176, the elevating flexible connection or cable 167 connected to said sleeve, the conveyor provided with the movable tripping device 177 adapted to engage said stud 176 and having the member 178 to be impinged against by the said incline 179, substantially as described and shown.

10. The combination with a building having several series of chutes 182, all having openings adjacent each other at another part of the building, said chutes leading downwardly from said opening for conducting respective mail-matter to be introduced therein to different locations in the building, a well or vertical passage-way in the building extending from the lower portion thereof below the ground upwardly to the upper ends of said chutes, the elevator normally located in the lower end of said well

having the several series of compartments therein, opening both outwardly and inwardly, a post-station having chutes in arrangement as described located outside of the building adjacent thereto, said chutes extending downwardly inclined and terminating opposite and next to the outwardly-opening compartment of said receptacle, and means for elevating the latter, for the purpose set forth.

11. In combination with a building having a mailing-chute, extending from upper floors downwardly to the lower part of the building and thence continued downwardly inclined outside of and below the building, a mail-receiving box into which said chute delivers, a post-station thereabove, a trackway and a conveyor movable along it, and means actuated by the conveyor for elevating the said mail-receiving box into the upper part of the post-station whereby it may deliver its contents into the said conveyor, substantially as described.

12. A building having several series of mail-chutes provided at their upper ends which are located in proximity to each other at an upper part of the building with receiving-openings, said chutes extended downwardly to different floors in the building, substantially as described.

13. A building having several series of mail-chutes provided at their upper ends which are located in proximity to each other at an upper part of the building, with mail-receiving openings, said chutes extended downwardly to different stories in the building, and one or more thereof entering for the delivery of the mail into respective apartments in said building, substantially as described.

14. In a mail-service system of the character described, in combination, a post-station, the letter-box D thereunder, a mailing-chute in the building leading downwardly and discharging into said letter-box, the suspension-cable for the box, the trackway, the movable part or sleeve 129 to which the cable is connected, the conveyor having an abutment, the device on said sleeve adapted to be engaged by the abutment of the conveyor, and means for automatically disengaging the said parts, substantially as and for the purposes set forth.

15. The combination with a post-station, the letter-box D and the trackway, of a building having a chute for conveying mail from the building into said box, of the conveyor movable along said trackway past the post-station, and means operated by the conveyor for bringing said box in proximity thereto, whereby the box may be discharged of its contents into the conveyor.

16. In a mail-service system, in a building, the series of chutes 182 having receiving-mouths located at an upper part of the building, in combination with the elevator having the series of mail-compartments corresponding to said chutes, a movable wall for temporarily closing the compartments at their ends toward said chutes in the building, means for raising and lowering the elevator, and means for operating the movable wall for the elevator, as and for the purpose set forth.

17. In a mail-service system, the combination with the building having the hoistway and chutes 182, of the elevator having the compartments substantially as described, and a curtain, movable across the side of the elevator which is toward said chutes, for opening and closing the compartments, means operating on the descent of the elevator for drawing the curtain across and closing the compartments, and means operative on the raising of the elevator for withdrawing said curtain leaving the compartments open for mail-delivery discharge into the chutes.

18. In a mail-service system of the character described, the combination with the building, having the chutes 182 and the hoistway, of the elevator 165 having the compartment 164 and provided with the curtain 205, the spring-roller 206 therefor, and the shaft or rod 208 provided to the curtain and having the catch members 209 and the studs 210, the abutments 213 and 214 located in the hoistway and the notches or shoulders 212 being provided in the conveyor, substantially as and for the purposes set forth.

19. The combination with the building having series of chutes 182 with a receiving-mouth located at an upper part of the building, the hoistway and the post-station chutes having their discharging ends terminating in the hoistway at a lower part of the latter, of the elevator 165 having the compartment 164, means for raising and lowering the elevator, and an adjustable stop for limiting the descent of the elevator whereby its lower position may be such as to insure its compartments matching with the discharging-mouths of the post-station chutes, substantially as shown.

699,408. MAIL-SERVICE APPARATUS. GEORGE A. OWEN, Springfield, Mass. Filed Mar. 15, 1898. Serial No. 104,354 (B-model.)

Claim.—1. In a mail-service, the combination of a hoistway, a carrier movable therein; a plate secured to the carrier and having an inclined deflecting portion, a clamping member pivoted to the plate transversely of the carrier; means for retaining the clamping member in its closed position; an arm on the clamping member extending transversely to the carrier; and means located in the hoistway for tripping said arm and thereby opening the clamping-member.

2. In a mail-service, the combination of a hoistway, a carrier mov-

able therein; the plate, 24, secured to the carrier and having the inclined deflecting portion 25; the clamping member, 26, pivoted to the plate, 24, transversely of the carrier; means for retaining the clamping member in its closed position; the arm, 23, on the clamping member extending transversely to the carrier; and means located in the highway for tripping said arm and thereby opening the clamping member.

2. In a mail-carrier, a building having the highway, wheels 20 and 22 therein and an endless flexible carrier around said wheels, later-hold-on mounted on said flexible carrier, and the journal-shaft 54 on which the said wheel 20 is mounted, the rock-shaft 50 and means for rocking it, and connection between said rock-shaft and said shaft 54 for imparting from the rocking movement of the former a step-by-step motion to the latter, for the purpose set forth.

4. In a mail-carrier in combination, the highway having the upper and lower wheels 29 and 30, the shaft 54 on which the latter is fixed, the rock-shaft 50 having the operating-lever 49 and the lever-arm 52, the drum 53 provided with the ratchet-teeth and the reversing-spring 57, and the strap 51 secured to said arm 52 and having a winding engagement around said drum, and the spring-pawl mounted on the wheel 20, as shown.

699,409. TRAVERSE-MOTION FOR SPINNING-MACHINES. ORRIS L. OWEN, Whitinsville, Mass., assigner to The Whitin Machine Works, Incorporated, Whitinsville, Mass. Filed Mar. 20, 1901. Serial No. 61,902. (No model.)

Claim.—1. A traverse-motion for spinning-machines, consisting in the combination of a pair of gears differing in the number of their teeth, and each having a cam connected therewith and driven thereby, a suitable gear for driving said differential gears, an oscillating lever rocking on a stationary fulcrum intermediate its ends, one end of said lever being acted upon by one of said cams to oscillate the lever, an arm pivoted to the other end of said lever so as to be swung thereby and acted upon by the other said cam to oscillate said arm, and a traverse-rod mounted on said swinging arm, substantially as and for the purpose set forth.

2. A traverse-motion for spinning-machines, consisting in the combination of a pair of gears differing in the number of their teeth, a suitable gear for driving said differential gears, a fixed stud and a sleeve turning thereon, said sleeve being provided with a cam and having one of said differential gears fast on said sleeve, the other said gear being loose on said sleeve and provided with a cam, an oscillating lever acted upon by the cam controlled by said loose gear, a swinging arm pivoted to said oscillating lever and acted upon by the cam controlled by said fast gear, and a traverse-rod mounted upon said swinging arm, substantially as and for the purpose set forth.

3. A traverse-motion for spinning-machines, consisting in the combination of a pair of gears differing in the number of their teeth, a set of drawing-rolls having the back one thereof provided with a driving-worm for actuating the said differential gears, a fixed stud and a sleeve turning thereon, said sleeve being provided with a cam and having one of said differential gears fast on said sleeve, the other said gear being loose on said sleeve and provided with a cam, an oscillating lever acted upon by the cam controlled by said loose gear, a swinging arm pivoted to said oscillating lever and acted upon by the cam controlled by said fast gear, and a traverse-rod mounted upon said swinging arm, substantially as and for the purpose set forth.

a traverse-rod mounted upon said swinging arm, substantially as and for the purpose set forth.

4. A traverse-motion for spinning-machines, consisting in the combination of a support *a* provided with a fixed stud *a'*, a loose sleeve *c* mounted upon said stud and provided with a cam *c*, a pair of differential gears *d* and *e*, the former mounted fast upon said sleeve and the latter mounted loosely thereon and provided with a cam *e'*, the said pair of gears simultaneously driven by the same means, an oscillating lever *d* rocking upon a pivot *f* and having its upper end engaged by the said cam *c* so as to oscillate the lever upon its pivot, a swinging arm *g* pivoted to the lower end of said lever *d*, and having its upper end engaged and actuated by the said cam *e'* for swinging it upon its pivot, and a traverse-rod carried by said swinging arm, substantially as and for the purpose set forth.

699,410. HAMMOCK. RALPH E. PARKER, Middletown, Conn. Filed May 4, 1901. Serial No. 60,737. (No model.)

Claim.—1. The combination with a hammock-spreader and hammock, the latter being provided with a pocket for the reception of the spreader, the said pocket having end walls adapted to conceal the ends of the spreader, of a clip for binding the spreader to the body of the hammock and to the wall of the pocket whereby the spreader is held in position with relation to the body of the hammock and is prevented from waving its end through the wall of the pocket under the lateral strain of the hammock, substantially as set forth.

2. The combination with a hammock-spreader and hammock, of a clip arranged to embrace the spreader and lock the hammock-body between it and the spreader and a suspension-rod secured between the clip and spreader, substantially as set forth.

3. The combination with a hammock having a suspension-rod extending at its ends down to the body of the hammock, the said hammock-body being provided with a spreader-pocket at its end, of a spreader located within the pocket at the end of the hammock and a clip embracing the spreader, the end of the cord and the wall of the pocket for locking the wall of the pocket and the cord to the spreader, substantially as set forth.

699,411. STANCHION. EDWIN FRISVOLD, Arlington, Mass. Filed May 17, 1900. Serial No. 17,005. (No model.)

Claim.—1. The combination with a suspended stanchion having a movable bar, of a link connecting the lower end of said stanchion with a fixed part of the barn structure.

2. A stanchion, a link connecting its lower end with a fixed part of the barn structure, and a secondary link affording a limiting-stop for the stanchion in its extreme position.

3. A stanchion, a stop on the fixed part of the barn structure, a link connecting the lower end of said stanchion with said fixed part, and means carried by the stanchion and under the control of the stop to lift the link and permit the lower end of the stanchion to slide forward as the cow is lying down or getting up.

4. The combination with a stanchion having in its lower end a sliding pin, of a link connecting said pin with a fixed part of the barn structure, a plurality of levers for lifting said pin and a suitable stop for said link.

5. A stanchion having at its upper end a pivoted bar-guiding loop having its outer end made substantially square, and a stationary holder to receive the upper end of the bar.

6. A pivoted stanchion having a loose bar rounded at its upper end and combined with a link connected at one end with one side of said movable bar, and a longer mating link or lever connected with the head of the stanchion.

7. A pivoted stanchion having a movable bar rounded at its upper end, combined with a link curved in two directions and connected at one end with the upper end of said bar, and at its opposite end with a curved end of a mating link or lever pivotedly mounted upon the head of the stanchion.

8. A pivoted stanchion having a movable bar rounded at its upper end, combined with a link curved in two directions and connected at one end with the upper end of said bar, and at its opposite end with a curved end of a mating link or lever pivotedly mounted upon the head of the stanchion, said mating link presenting the same curve as the link uniting it with the loose bar.

9. A pivoted stanchion having a connected movable bar, a curved link connected with the upper end of said movable bar, a curved mating link or lever pivotedly mounted upon the head of said stanchion, the point of connection of said link with the upper end of said bar being at the rear of a line drawn from the point of connection of said link with its longer mating link or lever and the connection of said longer mating link or lever with the stanchion.

699,412. DEVICE FOR OPERATING ELECTRIC LIGHTS IN RAILWAY-CARRIAGES FROM THE GUARD'S VAN. EDWIN J. FRISVOLD, Boston, Mass., and ARTHUR D. GILL, Northampton Park, England. Filed Dec. 6, 1900. Serial No. 730,000. (No model.)

Claim.—The combination with the main electric circuit, a plurality of translating devices each arranged in a branch of said main circuit, and a plurality of switches each arranged in and controlling one of said branches, of an electromagnet, a circuit-circuit in which said electromagnet is arranged, a hand-crank arranged in said circuit-circuit and by which the current is controlled which actuates said electromagnet, and mechanism operated by said electromagnet to move said switches to successively close said branches, and also operated by said electromagnet to move said switches to successively open said branches, substantially as set forth.

699,413. STORAGE BATTERY. JAMES E. KESSE, Boston, Mass., assigner of two-thirds to LEON WILLIAM DORRIS and LUCYLYN D. LATHROP, Gloucester, Mass. Filed Aug. 6, 1901. Serial No. 70,002. (No model.)

Claim.—1. A storage battery structure consisting of superposed layers of lead-fall having numerous perforated indentations each layer being entirely coated over both sides with active material.

2. A storage-battery element comprising a lead frame, superposed layers of perforated lead-fall filling the frame, and one or more lead cases passing through the frame and the lead-fall layers.

3. A storage-battery element comprising a single-piece lead frame subdivided into sections by twisted bars between openings and superposed layers of perforated and pitted lead-fall occupying said openings.

4. A storage-battery element comprising a single-piece lead frame subdivided into sections by twisted bars between openings, superposed layers of perforated and pitted lead-fall occupying said openings, and lead rivets passing through the said bars and the lead-fall, substantially as described.

5. A storage-battery element comprising a lead frame subdivided by cross-bars, superposed layers of lead-fall occupying the subdivisions of the frame, and one or more solid-lead cases extending through the frame, cross-bars and the lead-fall layers.

699,414. METHOD OF TREATING SOLUTIONS OF SALTS. CHAS. J. KINN, Philadelphia, Pa. Filed Aug. 1, 1901. Serial No. 70,000. (No specimen.)

Claim.—1. The method of treating a liquid electrolyte, which consists in electrolyzing the same in a plurality of cells having mercury cathodes and connected in series and subjecting the same mercury, as anodes, to electrochemical action in a few number of cells connected in series.

2. The method of treating a liquid electrolyte, which consists in electrolyzing it in a number of cells, in series, in which mercury constitutes the cathodes, subjecting the same mercury, as anodes, to electrochemical action in a few number of cells, in series, and transferring the mercury from cell to cell throughout the series.

3. The method of treating a liquid electrolyte, which consists in subjecting it to the action of an anode of electro-negative material and a moving disk-shaped metal cathode coated with mercury in a stationary reducing-cell, in series with a stationary oxidizing-cell and a body of mercury moving freely between said cells.

4. The method of treating a liquid electrolyte, which consists in subjecting the same to the action of an electric current in a plurality of reducing-cells containing a mercury cathode, in series with a few number of oxidizing-cells containing mercury and an electrolyte, transferring the amalgam produced in each reducing-cell to the next oxidizing-cell uninterruptedly and transferring the amalgam from each oxidizing-cell to the next reducing-cell in the series in separated portions.

5. The method of treating a solution of sodium chloride to produce sodium hydroxide and chlorine which consists in subjecting the solution to the action of an electric current in a plurality of reducing-cells containing a mercury cathode, in series with a few number of oxidizing-cells, transferring the resulting amalgam, and with it the electric current, from each reducing-cell to the next oxidizing-cell in the series and transferring the amalgam from each oxidizing-cell to the next reducing-cell in the series without thereby transferring the electric current.

6. The method of producing sodium hydroxide and chlorine from an aqueous solution of sodium chloride which consists in subjecting the solution to electrolytic action by means of mercury cathodes and anodes of electro-negative material in a plurality of reducing-cells, in series, subjecting the resulting amalgam to electrolytic action in a few number of oxidizing-cells, in series, and transferring the resulting amalgam from each cell to the next in the series.

699,415. ELECTROLYTIC APPARATUS. CHAS. J. KINN, Philadelphia, Pa. Filed Aug. 1, 1901. Serial No. 70,007. (No model.)

Claim.—1. In an electrolytic apparatus, a receptacle or compartment containing a body of mercury and a body of decomposable liquid superposed thereon, in combination with one or more electrodes of electro-negative material and one or more disk-shaped metal electrodes and means for moving said metal electrodes into and out of said body of mercury and within said receptacle or compartment to effect a distribution of mercury over the same.

2. In an electrolytic apparatus, the combination with a receptacle or compartment containing a decomposable liquid and a body of mercury, of one or more electrodes of electro-negative material, one or more disk-shaped metal electrodes and means for moving the metal electrode or

electrodes within said receptacle or compartment, into and out of the body of mercury and through the liquid to be decomposed.

3. In an electrolytic apparatus, the combination with a receptacle or compartment having a body of mercury and a body of superposed electrolyte, of a plurality of electrodes of electronegative material projecting into the electrolyte, a plurality of disk-shaped metal electrodes and means for moving the metal electrodes within said receptacle or compartment, through the electrolyte and into and out of the body of mercury.

4. In an electrolytic apparatus, the combination with a receptacle or compartment having a plurality of pockets containing mercury and a superposed liquid electrolyte, of a plurality of electrodes of electronegative material projecting into the electrolyte, a plurality of metal electrodes located in the electrolyte and alternately disposed with reference to the electronegative electrodes and means whereby the metal electrodes may be moved within said receptacle or compartment, through the electrolyte and into and out of the mercury.

5. In an electrolytic apparatus, the combination with a receptacle having a plurality of open pockets containing mercury and having a body of liquid electrolyte above the mercury, of a plurality of plates of electronegative material projecting into the electrolyte, a plurality of metal disks alternating with the electronegative plates, a shaft on which the disks are mounted and means for rotating the shaft to move the edges of the disks into and through the mercury.

6. In an electrolytic apparatus, the combination with a receptacle having a plurality of open pockets containing mercury and having a body of liquid electrolyte above the mercury, of a plurality of electrodes of electronegative material projecting into the electrolyte, a plurality of metal disks provided with side channels, a shaft on which said disks are mounted and means whereby said shaft may be rotated to move the edges of the disks through the mercury.

7. In an electrolytic apparatus, the combination with a receptacle having a plurality of open pockets containing mercury and having a body of liquid electrolyte above the mercury, of a plurality of electrodes of electronegative material projecting into the electrolyte, a plurality of metal disks provided with side grooves extending from their peripheries toward their centers, a shaft on which said disks are mounted and means whereby said shaft may be rotated to move the edges of the disks through the mercury.

8. In an electrolytic apparatus, the combination with a receptacle having a plurality of open pockets containing mercury and having a body of liquid electrolyte above the mercury, of a plurality of electrodes of electronegative material projecting into the electrolyte, a plurality of metal disks provided with curved guides extending from their peripheries toward their centers, a shaft on which said disks are mounted and means whereby said shaft may be rotated to move the edges of the disks through the mercury.

9. In an electrolytic apparatus, the combination with a reducing-cell and an oxidizing-cell each of which is provided with a body of mercury, a superposed body of electrolyte, one or more stationary electrodes of electronegative material and one or more movable metal electrodes, of means for transferring the amalgam from the one cell to the other without thereby effecting a transfer of electric current.

10. In an electrolytic apparatus, the combination with a reducing-cell and an oxidizing-cell each of which is provided with a body of mercury, a superposed body of liquid electrolyte, one or more electrodes of electronegative material, one or more metal electrodes, of a transfer device and means for rotating the metal electrodes in contact with the mercury and the electrolyte and means for operating the transfer device to transfer the resulting amalgam from the one cell to the other without thereby effecting a transfer of electric current.

11. In an electrolytic apparatus, the combination with one or more oxidizing-cells and a greater number of reducing-cells each of which con-

tains mercury, a superposed body of liquid electrolyte, one or more electrodes of electronegative material and one or more metal electrodes, of means for moving the metal electrodes through the electrolyte and the mercury to promote electrolytic action, an uninterrupted channel for the flow of amalgam between each reducing-cell and the next succeeding oxidizing-cell in the series and means for transferring the amalgam progressively from each oxidizing-cell to the next reducing-cell of the series without thereby transferring electric current.

12. In an electrolytic apparatus, the combination with a series of reducing-cells and oxidizing-cells, the former being greater in number than the latter, a single body of mercury located in and between each reducing-cell and the next oxidizing-cell in the series, a liquid electrolyte, one or more stationary electrodes of electronegative material and one or more movable metal electrodes in each cell and a non-conducting device for transferring the amalgam, produced by electrolytic action, from each oxidizing-cell to the next reducing-cell in the series without thereby transferring electrical energy.

13. In an electrolytic apparatus, a receptacle having an external, open channel along at least two of its sides and a plurality of wells in the bottom that communicate at their ends with said channel, a body of mercury in said channel and wells and a body of liquid electrolyte above the mercury, in combination with electrodes of electronegative material and metal electrodes and a cover having a sealing-flange that projects downwardly into the electrolyte.

14. In an electrolytic apparatus, a receptacle having a plurality of channels or wells in its bottom and two outside, open channels with which the ends of the interior channels connect and a cover having a sealing-flange that projects downwardly at a distance from the side walls.

15. In an electrolytic apparatus, the combination with one or more reducing-cells and one or more oxidizing-cells containing mercury and a liquid electrolyte and having external, open channels into which the mercury flows, of a non-conducting wheel having pockets and projecting into the mercury in one channel adjacent to its end wall and means for rotating said wheel to transfer mercury to the adjacent channel in insulated portions.

16. In an electrolytic apparatus, the combination with one or more reducing-cells and one or more oxidizing-cells containing mercury and a superposed electrolyte and having external, open channels into which the mercury flows but from which the electrolyte is excluded, a partition between each oxidizing-cell and the next reducing-cell in the series and a wheel having pockets and projecting into the mercury in each oxidizing-cell adjacent to the partition and means for rotating the wheel to transfer the mercury in insulated portions.

17. In an electrolytic apparatus, a plurality of reducing-cells, and a less number of oxidizing-cells each of which contains mercury and a liquid electrolyte, means for transferring the amalgam produced in the reducing-cells to the next oxidizing-cell in the series and thereby transmitting the electrical energy and means for transferring the amalgam from the oxidizing-cells to the next reducing-cells in series without thereby transferring electrical energy.

18. In an electrolytic apparatus, a plurality of oxidizing-cells and a greater number of reducing-cells each of which contains mercury and a liquid electrolyte, means for transferring the resulting amalgam from each reducing-cell to the next oxidizing-cell in the series as an unbroken mass and means for transferring the amalgam from each oxidizing-cell to the next reducing-cell in the series in insulated parts, thereby avoiding a transfer of the electrical energy.

699,416. ADJUSTABLE FORM FOR PAPER-BOX MACHINES.
CHARLES I. RUSSELL, Bridgeport, Conn. Filed Jan. 30, 1902. Serial No. 91,918. (No model.)

Claim.—1. An adjustable form for box-machines comprising inner and outer side and end parts, and corner-blocks to which they are secured, said inner side and end parts being provided with longitudinal slots, and said outer side and end parts with tongues which are passed through the slots and folded down upon the inner sides of the inner parts.

2. An adjustable form for box-machines comprising inner and outer side and end parts, corner-blocks to which they are secured, said inner side and end parts being provided with longitudinal slots and inwardly-

extending flanges, and said outer side and end parts with tongues which are passed through the slots and folded down upon the inner sides of the inner parts, and with flanges which partly inclose the flanges on the inner parts.

3. An adjustable form for box-machines comprising inner and outer side and end parts, an inner and an outer of said parts being formed integral, corner-blocks to which said parts are secured, the inner side and end parts being provided with longitudinal slots, and the outer side and end parts with tongues which are passed through the slots and folded down upon the inner sides of the inner parts.

4. An adjustable form for paper-box machines comprising inner and outer side and end parts, corner-blocks to which said parts are secured, intermediate blocks secured to the inner side parts, an attaching-block, levers 21 pivoted to opposite sides of the attaching-block and to diagonally opposite corner-blocks, dotted levers pivoted to the intermediate blocks, and screw-pins passing through the dots and engaging levers 21, whereby the side and end parts may be locked at any desired adjustment.

5. An adjustable form for paper-box machines comprising inner and outer side and end parts, means for securing said parts together leaving them free to slide over each other, corner-blocks to which said side and end parts are secured, intermediate blocks secured to the inner side parts, an attaching-block, levers 21 pivoted to opposite sides of the attaching-block and to diagonally opposite corner-blocks, levers 22 pivoted to the intermediate blocks, and means for locking contiguous levers 21 and 22 together and thereby securing the side and end parts at any required adjustment.

6. In an adjustable box-form the combination with inner and outer side and end parts and means for securing them together leaving them free to slide, of an attaching-block, levers 21 pivoted at diagonally opposite corners of the side and end parts and to opposite sides of the attaching-block, levers 22 pivoted to inner side parts and means for locking contiguous levers 21 and 22 together and thereby securing the side and end parts at any required adjustment.

7. In an adjustable box-form the combination with inner and outer side and end parts and means for securing them together leaving them free to slide, of an attaching-block, levers 21 pivoted at diagonally opposite corners of the side and end parts and to opposite sides of the attaching-block, levers 22 pivoted to inner side parts, means for locking contiguous levers 21 and 22 together, for the purpose set forth, and a cross-piece 24 for attachment to a hand-machine, said cross-piece having open and closed slots, and means operating in connection with said slots to lock said cross-piece in or out of operative position.

699,417. SHIPPING-PACKAGE. GEORGE F. BARNES, San Francisco, Cal. Filed Feb. 2, 1902. Serial No. 92,293. (No model.)

Claim.—1. A shipping-package consisting of an inner wooden strengthening-drum, an outer stove covering therefor bound by hoops or bands, an inner metallic lining fitted within, said lining terminating a short distance from each end of the drum and being secured to the wooden drum by means of hoops or bands which cover the ends of the said lining, and hoops or bands for the package supported within the inner drum by the hoops or bands which attach the metallic lining thereto, each having a metallic inner surface and being held in place by means of hoops or bands nailed to the inner strengthening-drum.

2. A shipping-package consisting of an inner wooden strengthening-drum, an outer stove covering therefor bound by hoops or bands, an inner metallic lining fitted within, said lining terminating a short distance from each end of the drum and being secured to the wooden drum by means of hoops or bands which cover the ends of the metallic lining, a waterproof filling interspersed between the said lining and the wooden

strengthening-drum, and hoops or bands for the package supported within the inner drum by the hoops or bands which secure the metallic lining thereto, said hoops or bands being secured to the package by means of hoops or bands.

699,418. EGG-PRESERVING SAFE. ROBERT E. SEARS, Sacramento, Cal., assignor to E. C. Huddell, Sacramento, Cal. Filed Sept. 23, 1901. Serial No. 79,192. (No model.)

Claim.—1. The combination in an egg-safe of an outer case having journal-shafts at the center of its ends and supports therefor, interior cases having individual compartments adapted to contain eggs or the like said inner cases separated from each other and from the inner walls of the outer case to form intermediate channels, and means whereby air may be introduced and circulated through said channels.

2. The combination in an egg-safe of an outer case having tubular shafts or journals at the center of its ends, and supports upon which they are turnable, interior cases having individual compartments adapted to contain and separate the eggs or the like, said interior cases separated from each other and from the outer case to form channels between the interior cases and between them and the outer case, and gates whereby the air admitted to said channels is diverted and caused to pass around the inner cases between the inlet and outlet passages.

3. An apparatus for containing and preserving eggs and the like, consisting of an exterior case, having tubular journals centrally fixed to the opposite ends, supports therefor, interior cases separated from each other and from the outer case to form channels or spaces between said interior cases and the outer case, said interior cases having separate compartments in which the contents are placed, means whereby air may be introduced through one of the hollow journal-shafts, a valve-controlled exit and gates interspersed between the inner and outer cases whereby the current of air is directed successively around the interior cases.

699,419. MACHINE FOR WRAPPING PAMPHLETS OR SIMILAR ARTICLES. EDWARD P. SHELTON, Brooklyn, N. Y. Filed Sept. 2, 1901. Serial No. 74,946. (No model.)

Claim.—1. In a machine for wrapping pamphlets or similar articles, the combination with revolving devices adapted to form a wrapping-space between them and to coast to roll a pamphlet and its wrapper together within said wrapping-space and secure the wrapper; of means adapted to deliver the wrapped pamphlet from the wrapping-space, comprising a depression or recess in one of said revolving devices, adapted to receive the wrapped pamphlet and to convey the same away from the wrapping-space.

2. In a machine for wrapping pamphlets or similar articles, the combination with revolving devices adapted to form a wrapping-space between them and to coast to roll a pamphlet and its wrapper together within said wrapping-space and secure the wrapper; and means adapted to move said revolving devices or some of them so as to vary the size of said wrapping-space; of means for delivering the wrapped pamphlet from the wrapping-space comprising a depression or recess in one of said revolving devices, adapted to receive the wrapped pamphlet and convey the same away from the wrapping-space.

3. In a machine for wrapping pamphlets or similar articles, the combination with revolving devices adapted to form a wrapping-space between them and to coast to roll a pamphlet and its wrapper together within said wrapping-space and secure the wrapper; non-revolving guides adapted to cooperate with said revolving devices in acting upon said pamphlet and wrapper; and means adapted to move said guides to enlarge the wrapping-space as the roll being formed therein enlarges and is about to leave the wrapping-space; of means adapted to deliver the wrapped pamphlet from the wrapping-space, comprising a depression or recess in one of said revolving devices, adapted to receive the wrapped pamphlet and convey the same away from the wrapping-space.

4. In a machine for wrapping pamphlets or similar articles, the combination with revolving devices adapted to form a wrapping-space between them and to coast to roll a pamphlet and its wrapper together within said wrapping-space and secure the wrapper; of means adapted to deliver the wrapped pamphlet from the wrapping-space, comprising a depression or recess in one of said revolving devices adapted to receive the wrapped pamphlet and convey the same away from the wrapping-space, devices

grippers comprising a shaft 158, arms 161 and 162, guides 165 and 166, and a spring 163.

31. In a machine for wrapping pamphlets or similar articles, the combination with a series of revolving devices, adapted to form a wrapping-space between them and to coast to roll a pamphlet and its wrapper together within said wrapping-space and secure the wrapper; of a receptacle for holding the pamphlets to be wrapped, having a floor the end of which adjacent to the said revolving devices is adapted to be moved vertically and is provided with a stop adapted to check said pamphlets; means for holding one of said pamphlets momentarily stationary as regards vertical movement and then drawing it toward said revolving devices; means for lowering the said stop while said pamphlet is so being held stationary as regards vertical movement, whereby the lower edge of said pamphlet is permitted to pass over said stop; and means for conveying said pamphlet to said wrapping-space.

32. In a machine for wrapping pamphlets or similar articles, the combination with a series of revolving devices, adapted to form a wrapping-space between them and to coast to roll a pamphlet and its wrapper together within said wrapping-space and secure the wrapper; of a receptacle for holding the pamphlets to be wrapped, the end of which adjacent to the said revolving devices is adapted to be moved vertically and is provided with a check adapted to hold said pamphlets; means for holding one of said pamphlets momentarily stationary as regards vertical movement and then drawing it toward said revolving devices, comprising a vacuum-pump, pipes connected therewith, sucking-openings at the ends thereof, and means for moving said pipes; means for lowering said stop while said pamphlet is so being held stationary as regards vertical movement, whereby the lower edge of said pamphlet is permitted to pass over said stop; and means for conveying said pamphlet to said wrapping-space.

33. In a machine for wrapping pamphlets or similar articles, the combination with a series of revolving devices, adapted to form a wrapping-space between them and to coast to roll a pamphlet and its wrapper together within said wrapping-space and secure the wrapper; of a receptacle for holding the pamphlets to be wrapped, the end of which adjacent to the said revolving devices is adapted to be moved vertically and is provided with a check adapted to hold said pamphlets; means for holding one of said pamphlets momentarily stationary as regards vertical movement and then drawing it toward said revolving devices, comprising a vacuum-pump, pipes having sucking-openings at the ends thereof, means for moving the sucking ends of said pipes backward and forward and means for placing said pipes in communication with said pump when their sucking ends are forward and in communication with the open air when said ends are backward; means for lowering said stop while said pamphlet is so being held stationary as regards vertical movement, whereby the lower end of said pamphlet is permitted to pass over said stop; and means for conveying said pamphlet to said wrapping-space.

34. In a machine for wrapping pamphlets or similar articles, the combination with a series of revolving devices, adapted to form a wrapping-space between them and to coast to roll a pamphlet and its wrapper together within said wrapping-space and secure the wrapper; of a receptacle for holding the pamphlets to be wrapped, the end of which adjacent to the said revolving devices is adapted to be moved vertically and is provided with a check adapted to hold said pamphlets; means for holding one of said pamphlets momentarily stationary as regards vertical movement and then drawing it toward said revolving devices, comprising a vacuum-pump, pipes having sucking-openings at the ends thereof, means for moving the sucking ends of said pipes backward and forward and means for placing said pipes in communication with said pump when their sucking ends are forward and in communication with the open air when said ends are backward; means for lowering said stop while said pamphlet is so being held stationary as regards vertical movement, whereby the lower end of said pamphlet is permitted to pass over said stop; and means for conveying said pamphlet to said wrapping-space, comprising grippers borne by one or more of said revolving devices and means for operating the same.

35. In a machine for wrapping pamphlets or similar articles the combination with revolving devices adapted to form a wrapping-space between them and to coast to roll a pamphlet and its wrapper together within said wrapping-space and secure the wrapper; and devices adapted to introduce a pamphlet edgewise into said wrapping-space; devices adapted to separate a wrapper for said pamphlet from a sheet of paper; devices adapted to gun an edge of said covered wrapper; and devices adapted to feed said covered wrapper into said wrapping-space; the said feeding device being adapted to pass momentarily and permit the wrapper to remain stationary while the gun is being applied thereto; of means adapted to deliver the wrapped pamphlet from the wrapping-space, comprising a depression or recess in one of said revolving devices adapted to receive the wrapped pamphlet and convey the same away from the wrapping-space.

36. In a machine for wrapping pamphlets or similar articles the combination with revolving devices adapted to form a wrapping-space

between them and to coast to roll a pamphlet and its wrapper together within said wrapping-space and secure the wrapper; and devices adapted to introduce a pamphlet edgewise into said wrapping-space; devices adapted to separate a wrapper for said pamphlet from a sheet of paper; devices adapted to gun an edge of said covered wrapper; and devices adapted to feed said covered wrapper into said wrapping-space, passing momentarily while the wrapper is being covered and its edge gunned, and then continuing said feeding; of means adapted to deliver the wrapped pamphlet from the wrapping-space, comprising a depression or recess in one of said revolving devices adapted to receive the wrapped pamphlet and convey the same away from the wrapping-space.

37. In a machine for wrapping pamphlets or similar articles, the combination with revolving devices adapted to form a wrapping-space between them and to coast to roll a pamphlet and its wrapper together within said wrapping-space and secure the wrapper; and devices adapted to introduce a pamphlet edgewise into said wrapping-space; devices adapted to separate a wrapper for said pamphlet from a sheet of paper; devices adapted to feed said wrapper into the wrapping-space; and adjustable means adapted to control the operation of the wrapper-feeding device with relation to the covering device so that a variable amount of paper may be fed before same is covered; of means adapted to deliver the wrapped pamphlet from the wrapping-space.

38. In a machine for wrapping pamphlets or similar articles, the combination with shafts 22, 25, 26, 27, and 28 bearing respectively gear-wheels 27, 29, 30, 32, 43, and 46 and rollers 28, 30, 31, 32, and 33; and intermediate gear-wheels adapted to cause said shafts to all revolve in the same direction; said rollers forming a wrapping-space adapted to wrap a pamphlet and its wrapper between them and secure the wrapper; of grippers 160 borne by said rollers 29 adapted to convey a pamphlet into said wrapping-space, and means for operating the same comprising a shaft 158, an arm 161, and guides 165 and 166.

39. In a machine for wrapping pamphlets or similar articles, the combination with shafts 22, 25, 26, 27, and 28 bearing respectively gear-wheels 27, 29, 30, 32, 43, and 46 and rollers 28, 30, 31, 32, and 33; and intermediate gear-wheels adapted to cause said shafts to all revolve in the same direction; said rollers forming a wrapping-space adapted to wrap a pamphlet and its wrapper between them and secure the wrapper; of grippers 160 borne by said rollers 29 adapted to convey a pamphlet into said wrapping-space, and means for operating the same comprising a shaft 158, an arm 161 and 162, guides 165 and 166, and a spring 163.

40. In a machine for wrapping pamphlets or similar articles, the combination with rollers 28, 30, 31, 32, and 33, and guides 200 and 201, of means for moving said rollers and said guides to vary the size of the wrapping-space formed between the same so as to accommodate rolled pamphlets of different diameters.

41. In a machine for wrapping pamphlets or similar articles, the combination with revolving devices adapted to form a wrapping-space between them and to coast to roll a pamphlet and its wrapper together within said wrapping-space and secure the wrapper; of means adapted to deliver the wrapped pamphlet from the wrapping-space, comprising a depression or recess in one of said revolving devices adapted to receive the wrapped pamphlet and convey the same away from the wrapping-space, and devices adapted to eject the wrapped pamphlet from the wrapping-space, comprising a plunger 237, arm 238, sleeve 236 and spring 235.

42. In a machine for wrapping pamphlets or similar articles, the combination with revolving devices adapted to form a wrapping-space between them and to coast to roll a pamphlet and its wrapper together within said wrapping-space and secure the wrapper; of means adapted to deliver the wrapped pamphlet from the wrapping-space, comprising a depression or recess in one of said revolving devices adapted to receive the wrapped pamphlet and convey the same away from the wrapping-space, and devices adapted to eject the wrapped pamphlet from the said depression or recess, comprising fingers 175, a shaft 176, arms 171, 173 and 178, a spring 172 and a cam 179.

43. In a machine for wrapping pamphlets or similar articles the combination with revolving devices adapted to form a wrapping-space between them and to coast to roll a pamphlet and its wrapper together within said wrapping-space and secure the wrapper; and devices adapted to introduce a pamphlet edgewise into said wrapping-space; and devices adapted to feed a wrapper into said wrapping-space, comprising a finger 54, lever 51, rod 52, and a cam on the shaft 51; of means adapted to deliver the wrapped pamphlet from the wrapping-space, comprising a depression or recess in one of said revolving devices adapted to receive the wrapped pamphlet and convey the same away from the wrapping-space.

44. In a machine for wrapping pamphlets or similar articles the combination with revolving devices adapted to form a wrapping-space between them and to coast to roll a pamphlet and its wrapper together within said wrapping-space and secure the wrapper; and devices adapted to introduce a pamphlet edgewise into said wrapping-space; and de-

vices adapted to feed a wrapper into said wrapping-space, comprising rollers 51, 52, 54, and 57, a finger 54, lever 51, rod 52, and a cam on the shaft 51; of means adapted to deliver the wrapped pamphlet from the wrapping-space, comprising a depression or recess in one of said revolving devices adapted to receive the wrapped pamphlet and convey the same away from the wrapping-space.

45. In a machine for wrapping pamphlets or similar articles, the combination with revolving devices adapted to form a wrapping-space between them and to coast to roll a pamphlet and its wrapper together within said wrapping-space and secure the wrapper; and devices adapted to introduce a pamphlet edgewise into said wrapping-space; devices adapted to separate a wrapper for said pamphlet from a sheet of paper, comprising a knife 100, arm 101, 104 and 105, a spring 103, rod 107, and cam 108; and devices adapted to feed said covered wrapper into the wrapping-space, comprising rollers 51, 52, 54, and 57, a finger 54, lever 51, rod 52, and a cam on the shaft 51; of means adapted to deliver the wrapped pamphlet from the wrapping-space, comprising a depression or recess in one of said revolving devices adapted to receive the wrapped pamphlet and convey the same away from the wrapping-space.

46. In a machine for wrapping pamphlets or similar articles the combination with revolving devices adapted to form a wrapping-space between them and to coast to roll a pamphlet and its wrapper together within said wrapping-space and secure the wrapper; and devices adapted to introduce a pamphlet edgewise into said wrapping-space; devices adapted to separate a wrapper for said pamphlet from a sheet of paper, comprising a knife 100, arm 101, 104 and 105, a spring 103, rod 107 and cam 108; devices adapted to gun an edge of said covered wrapper, comprising a gunner 120, and means for operating the same, a roller for applying gun thereto, and means for reciprocating said roller between a source of gun-supply and said gunner 120; and devices adapted to feed said covered wrapper into the wrapping-space, comprising rollers 51, 52, 54, and 57, a finger 54, lever 51, rod 52, and a cam on the shaft 51; of means adapted to deliver the wrapped pamphlet from the wrapping-space, comprising a depression or recess in one of said revolving devices adapted to receive the wrapped pamphlet and convey the same away from the wrapping-space.

699,490. PRINTING-MACHINE. ROBERT L. SHAWMAN and HENRY A. SHAWMAN, JR., New Orleans, La. Filed Sept. 26, 1901. Serial No. 74,572. (No model.)

Claim.—1. The combination with a plurality of rollers adjustably mounted in guideways, of a tension device for regulating the pressure between said rollers, comprising a pair of substantially elliptical-shaped springs, the lower faces of which are provided with central concave depressions, forming bearing-surfaces adapted to engage the shaft of the end roller, and adjustment-screws engaging said springs opposite said central depressions.

2. The combination with a clamped frame and a plurality of rollers adjustably mounted therein, of a tension device for regulating the pressure between said rollers, comprising a pair of substantially elliptical-shaped springs, provided with a central inwardly-projecting bearing-surface, engaging the shaft of the end roller, and outwardly-bent ends opposite said bearing-surface, thinblades mounted in said frame for retaining the ends of said springs, and an adjustment-screw operating in said thinblades and engaging the end of said springs.

699,491. NON-EXPLODABLE BOTTLE. DANIEL K. SMITH, Portsmouth, Va. Filed Dec. 14, 1901. Serial No. 55,393. (No model.)

Claim.—In a device of the class described, the combination of a receptacle provided with a neck composed of upper and lower portions, the upper portion being approximately cylindrical and the lower portion being provided with a valve-seat and having an approximately horizontal guard or flange, and the approximately cylindrical shield or guard open

at the top to receive a cork and fitted in the upper portion of the neck and provided with a stem extending into the lower portion of the neck, said shield or guard being provided at the bottom with exterior recesses, substantially as described.

699,492. METHYLENE DICHLORIDE AND PROCESS OF MAKING SAME. WILLIAM STRECHER, Berlin, Germany, assignor to Chemische Fabrik und Aktien, (vorm. E. Schering,) Berlin, Germany. Filed Oct. 29, 1901. Serial No. 59,459. (No specimens.)

Claim.—1. The herein-described process of manufacturing methylene dichloride, which consists in causing formaldehyde, preferably in a polymeric state, to react upon chloric acid and isolating the resulting product, substantially as set forth.

2. As a new product the herein-described methylene dichloride, being a white crystalline powder, difficultly soluble in cold but easily in hot water, and melting at 209° centigrade.

699,493. DIMETHYLENE TARTRATE AND METHOD OF MAKING SAME. WILLIAM STRECHER, Berlin, Germany, assignor to Chemische Fabrik und Aktien, (vorm. E. Schering,) Berlin, Germany. Filed Oct. 29, 1901. Serial No. 59,460. (No specimens.)

Claim.—1. The herein-described process of manufacturing dimethylene tartrate, which consists in causing formaldehyde to react upon tartaric acid in the presence of a condensing agent which at the same time withdraws water, and isolating the resulting product, substantially as set forth.

2. As a new product the herein-described dimethylene tartrate forming fine needles which melt at 120° centigrade, being easily soluble in alcohol, acetone and chloroform, substantially as set forth.

699,494. UMBRELLA-COVER FASTENING. AUGUSTUS C. STROMM, Troy, Ohio, assignor to the Troy Carriage and Shade Company, Troy, Ohio, a Corporation of Ohio. Filed Jan. 6, 1902. Serial No. 55,394. (No model.)

Claim.—1. The combination with the web of the seam of the cover and the supporting-rib for the cover, said rib having plain outer ends, of the fastener composed solely of a single metallic sheet, formed into a clamp arranged substantially in two hollow parallel portions with flanged outer ends, the clamping portion to engage and confine said web and the other portion to receive and hold the plain ends of said rib, substantially as specified.

2. The combination with the web of the seam of the cover and the supporting-rib for the cover, said rib having plain outer ends, of a fastener composed of a single metallic sheet formed into a clamp, having indicated sides, substantially dividing it into two hollow parallel portions, with closed outer ends, the clamping portion to engage and confine said web and the other portion to receive and hold the plain ends of said rib, substantially as specified.

3. The combination with the web of the seam of the cover and the supporting-rib for the cover, said rib having plain outer ends, of a fastener composed of a single metallic sheet formed into a clamp, one side being inwardly folded back and extended across the interior, dividing the fastener into two hollow portions with closed outer ends, the clamping portion to engage and confine said web and the other portion to receive and hold the plain end of said rib, substantially as specified.

699,425. SAFETY WATCH-POCKET. HARRIS M. STRAIN.
Chicago, Ill. Filed Jan. 24, 1902. Serial No. 61,062. (No model.)

Claim.—1. The combination with a pocket, of a guard-flap having its upper edge stitched along the top of the pocket at the inner side of the pocket-mouth and provided adjacent its line of attachment with a hole extending lengthwise of the pocket adjacent the line of stitches at its upper edge for the passage of a watch-chain.

2. The combination with a pocket, of a guard-flap shorter than the mouth of the pocket and having its upper edge stitched along the top of the pocket at the inner side of the pocket-mouth and provided adjacent its line of attachment with a hole extending lengthwise of the pocket near one end of the guard-flap and parallel with its line of attachment to the pocket.

699,426. MACHINE FOR THE TORREFACTION OF COFFEE. FRANK G. THIE, Paris, France. Filed Aug. 2, 1901. Serial No. 70,779. (No model.)

Claim.—1. In a machine of the character described, the combination with a casing, a ring rotatably secured in said casing, a spindle, a square and cylindrical and formed on said spindle, a spherical casing revolvably mounted in said ring, wheels 12 and 19 arranged within said ring for revolving said spherical casing, and means to rotate said ring.

2. In a coffee-roaster, the combination of an outer casing, a furnace arranged in said casing, a crank-shaft secured in said casing, a furnace arranged in said casing, a crank-shaft secured in said casing, a spindle, a square and cylindrical and formed on said spindle, a spherical casing revolvably mounted in said ring, wheels 12 and 19 arranged within said ring, for revolving said spherical casing, and means to rotate said ring.

699,427. MOTOR-VEHICLE. JOHN R. TROSTENBERG, London, England. Filed June 1, 1901. Serial No. 62,712. (No model.)

Claim.—1. In a motor-vehicle, the combination with a driving-gear thereof, of a spring-mounted frame, a motor carried by said frame, a train of gearing for transmitting the power from the motor to the driving-gear, a bracket supporting that gear of the train which meshes with the driving-gear, and a compensating connection between the bracket and the spring-mounted frame, substantially as described.

2. In a motor-vehicle, the combination with a driving-gear thereof, of a spring-mounted frame, a motor carried by said frame, a train of gearing for transmitting the power from the motor to the driving-gear, a bracket carried on the vehicle-frame and supporting that gear of the train which meshes with the driving-gear, and a compensating connection between the bracket and the spring-mounted frame, substantially as described.

3. In a motor-vehicle, the combination with a driving-gear thereof, of a spring-mounted frame, a motor carried by said frame, a gear for transmitting power from the motor to the driving-gear, a flexible shaft, a bracket supporting one end of said flexible shaft and transmitting-gear, and a compensating connection between the bracket and the spring-frame, substantially as described.

4. In a motor-vehicle, the combination with a driving-gear thereof, of a spring-mounted frame, a motor carried by said frame, a gear for transmitting power from the motor to the driving-gear, a flexible shaft, a bracket carried on the axle of the vehicle, said bracket supporting one end of said flexible shaft and transmitting-gear, and a compensating connection between the bracket and the spring-frame, substantially as described.

5. In a motor-vehicle, the combination with a driving-gear thereof, of a spring-mounted frame, a motor carried by said frame, a gear for transmitting power from the motor to the driving-gear, a flexible shaft, one end of which is supported by the spring-frame, a bracket supporting the other end of the flexible shaft and the power-transmitting gear, and a compensating connection between the bracket and the spring-frame, substantially as described.

6. In a motor-vehicle, the combination with a driving-gear thereof, of a spring-mounted frame, a motor carried by said frame, a gear for transmitting power from the motor to the driving-gear, a flexible shaft, one end of which is supported by the spring-frame, a bracket carried on the axle of the vehicle, said bracket supporting the other end of the flexible shaft and the power-transmitting gear, and a compensating connection between the bracket and the spring-frame, substantially as described.

7. In a motor-vehicle, the combination with a driving-gear thereof, said gear being mounted on the axle of the vehicle, of a spring-mounted frame, a motor carried by said frame, a gear for transmitting power from the motor to the driving-gear, a flexible shaft, a bracket supporting one end of said flexible shaft and the transmitting-gear, and a compensating connection between the bracket and the spring-frame, substantially as described.

8. In a motor-vehicle, the combination with a driving-gear thereof, said gear being mounted on the axle of the vehicle, of a spring-mounted frame, a motor carried by said frame, a gear for transmitting power from the motor to the driving-gear, a flexible shaft, a bracket carried on the axle of the vehicle, said bracket supporting one end of said flexible shaft and the transmitting-gear, and a compensating connection between the bracket and the spring-frame, substantially as described.

9. In a motor-vehicle, the combination with a driving-gear thereof, said gear being mounted on the axle of the vehicle, of a spring-mounted frame, a motor carried by said frame, a gear for transmitting power from the motor to the driving-gear, a flexible shaft, one end of which is supported by the spring-frame, a bracket supporting the other end of the flexible shaft and the power-transmitting gear, and a compensating connection between the bracket and the spring-frame, substantially as described.

10. In a motor-vehicle, the combination with a driving-gear thereof, said gear being mounted on the axle of the vehicle, of a spring-mounted frame, a motor carried by said frame, a gear for transmitting power from the motor to the driving-gear, a flexible shaft, one end of which is supported by the spring-frame, a bracket carried on the axle of the vehicle, said bracket supporting the other end of the flexible shaft and the power-transmitting gear, and a compensating connection between the bracket and the spring-frame, substantially as described.

11. In a motor-vehicle, the combination with a driving-gear thereof, of a spring-mounted frame, a motor carried by the frame, a bracket mounted so as to be movable about the axle of said driving-gear, a flexible shaft driven by the motor, a power-transmitting gear driven by the shaft, one end of said shaft and said transmitting-gear being carried on the bracket, and a compensating connection between the bracket and the spring-frame, substantially as described.

12. In a motor-vehicle, the combination with a driving-gear thereof, said gear being mounted on the axle of the vehicle, of a spring-mounted frame, a motor carried by said frame, a bracket loosely mounted on the axle of the vehicle, a flexible shaft driven by the motor, a power-transmitting gear connected to the shaft, one end of the shaft and said gear being supported in the bracket, and a compensating connection between the bracket and a spring-frame, substantially as described.

13. In a motor-vehicle, the combination with a driving-gear thereof, of a spring-mounted frame, a motor carried by the frame, a train of gearing for transmitting the power from the motor to the driving-gear, a bracket supporting that gear of the train which meshes with the driving-gear, said bracket being mounted so as to be movable about the axle of the driving-gear, and a pivoted-link compensating connection between the bracket and the spring-mounted frame, substantially as described.

14. In a motor-vehicle, the combination with a driving-gear thereof, of a spring-mounted frame, a motor carried by said frame, a train of gearing for transmitting the power from the motor to the driving-gear, a bracket carried on the vehicle-frame and supporting that gear of the train which meshes with the driving-gear, and a compensating connection between the bracket and the spring-mounted frame, substantially as described.

15. In a motor-vehicle, the combination with a driving-gear thereof, said gear being mounted on the axle of the vehicle, of a spring-mounted frame, a motor carried by the frame, a bracket supported on and movable about the axle of the vehicle, a flexible shaft driven from the motor, a power-transmitting gear, said flexible shaft and transmitting-gear being supported in the bracket, and a pivoted compensating connection between the bracket and the spring-frame, substantially as described.

16. In a motor-vehicle, the combination with a driving-gear thereof, said gear being mounted on the axle of the vehicle, of a spring-mounted frame, a motor carried by the frame, a bracket supported on and movable about the axle of the vehicle, a flexible shaft driven from the motor, a power-transmitting gear, said flexible shaft and transmitting-gear being supported in the bracket, a pivoted-link compensating connection between the bracket and the spring-frame, and a spring interposed in said connection, substantially as described.

17. In a motor-vehicle, the combination with a spring-mounted frame, of a motor carried thereby, a driving-gear for the vehicle mounted on the axle thereof, a bracket supported upon and movable about the axle of the vehicle, a power-transmitting gear, a flexible shaft for driving said transmitting-gear, one end of said shaft and said power-transmitting gear being supported by the bracket and the other end of said shaft being carried in the spring-frame, and a link pivoted to the bracket and to the frame, and forming a compensating connection, substantially as described.

699,428. VEHICLE-SEAT. LOUIS R. THORLOV, Thompson, N. Y. Filed Mar. 12, 1902. Serial No. 67,904. (No model.)

Claim.—1. In a vehicle of the character described, the combination of a seat having a single depending supporting-arm rigidly connected thereto at each end of the seat, said supporting-arm being provided with a series of perforations to adjust the height of seat, a pivot-bolt adapted to enter any of said perforations and support the seat, a bracket extended from either side of the depending supporting-arm and having downward-turned ends, and a spring directly connecting the downward-turned ends of the brackets on each side of the depending supporting-arm with the seat.

2. In a vehicle, the combination of a seat, a depending supporting-arm fixedly secured to the seat, means for pivotally connecting the depending arm to the vehicle-body at a point below the seat to permit the latter to have a bodily-swinging movement in the arc of a circle about the pivotal connection of the depending arm with the vehicle body due to vehicle motion, spring-connecting devices as brackets having downward-turned ends projecting to each side of the depending supporting-arm, and springs directly connecting the seat at each side of the depending supporting-arm with the downward-turned ends of said devices to control the bodily-swinging movement of the seat to either side of a vertical plane passing through the pivot of the depending supporting-arm.

3. In a vehicle of the character described, the combination of a seat, a depending supporting-arm at each end of the seat and rigidly secured thereto, the said supporting-arm at points remote from the seat having pivotal connection with the carriage-body to permit the seat as an entirety to swing in the arc of a circle about the pivotal connection of the supporting-arm within the carriage-body due to vehicle motion, spring-connecting devices as brackets having downward-turned ends provided with hooks and projecting to each side of the depending supporting-arm directly beneath the seat, and springs disposed on each side of the depending supporting-arm and connecting the hooked ends of the spring-connecting devices or brackets with the seat to control the bodily-swinging movement of the seat about the pivotal connection of the supporting-arm with the vehicle-body.

699,429. HEATING-STOVE. GEORGE W. WILSON, Delaware, Ohio, assignor of three-fourths to Henry B. Bump, August P. Miller, and Frank W. Young, Delaware, Ohio. Filed Aug. 17, 1901. Serial No. 71,000. (No model.)

Claim.—1. A heating-stove having side walls, with their lower portions, around the fire-box, reinforced and their upper portions, which surround the combustion-chamber, separated to form a smoke-flue which passes around the combustion-chamber, said smoke-flue communicating with the interior of the stove and with the smoke-outlet thereof, substantially as described.

2. A heating-stove having a smoke-flue formed with the side walls thereof, said smoke-flue passing around the stove, communicating with the interior thereof and with the smoke-outlet, and an air-heating flue disposed within the said smoke-flue and depending from the top of the stove, the latter having an air-intake opening at one end of said air-heating flue, and a discharge-opening at the opposite end thereof, proximate to the smoke-outlet, substantially as described.

3. A heating-stove having side walls with their lower portions, around the fire-box, reinforced and their upper portions, which surround the combustion-chamber, separated to form a smoke-flue which passes around the combustion-chamber, said smoke-flue communicating with the interior of the stove and with the smoke-outlet thereof, and an air-heating flue disposed within the said smoke-flue and having an intake and an outlet for air, substantially as described.

699,430. ROTARY GOLF-EDGE SETTER. HAROLD A. WHITTE, Everett, Mass., assignor to Herbert B. Norton, Everett, Mass. Filed Feb. 22, 1901. Serial No. 62,661. (No model.)

Claim.—1. An edge-setter comprising a driving member and series of taper rolls secured to said driving member with their outer ends in an axial plane different from that of their inner ends.

2. As a new article of manufacture, an edge-setter member comprising a tapered or conical roll.

699,431. MAIL-POUCH ADDRESS AND FASTENING ATTACHMENT. HERBERT D. WILSON, San Jose, Cal., assignor of three-fourths to Wm. C. Hawley and E. F. Laventure, San Jose, Cal. Filed June 10, 1901. Serial No. 62,974. (No model.)

Claim.—The combination with a mail-pouch and a flap permanently secured to the flap thereof, and having an end opening, of a strap having one end secured to the flap, a channelled plate secured to the free end of the strap and plate having a bolt projecting from its front end, the outer side of said bolt forming the top wall of the channel, at the entrance thereto whereby the address-card or label is inserted from beneath the flap and its end is protected by the overhanging bolt, said bolt adapted

to engage the end opening of the lock and the end of the cord or label being in line with the solid wall of the lock below the opening.

699,432. LAMP-WICK. EMERY WILSON, Philadelphia, Pa. Filed July 28, 1901. Serial No. 68,682. (No model.)

Claim.—A lamp wick the upper part of which is constructed of a series of separate detachable combustible horizontal sections or ribs.

699,433. SPARKING SWITCH FOR EXPLOSIVE-ENGINE. RICHARD L. YOUNG, Milwaukee, Wis., assignor of one-half to Thomas J. Price, Milwaukee, Wis. Filed July 8, 1901. Serial No. 67,444. (No model.)

Claim.—1. In a sparking igniter for explosive-engines, the combination of a cylinder, electrodes extending into said cylinder and insulated therefrom, an electrical conductor extending from one of said electrodes and leading to the source of electrical supply, a rotatable cam-shaft, an insulating-disk mounted thereon, a metallic ring secured to and surrounding the disk, and provided with a contact-point projecting therefrom and adapted to make contact with the outer end of one of the electrodes on each revolution of the cam-shaft, a metallic rod having one end in contact with the metallic ring, and an electrical conductor connecting said rod with the source of electrical supply.

2. In a sparking igniter for explosive-engines, the combination of a cylinder, electrodes extending into said cylinder and insulated therefrom, an electrical conductor extending from one of said electrodes and leading to the source of electrical supply, a contact-point secured to the outer end of the other electrode, a rotatable cam-shaft, an insulating-disk mounted thereon, a metallic ring secured to and surrounding the disk, and provided with a contact-point adapted to make contact with the contact-point of the electrode on each revolution of the cam-shaft, a metallic rod having one end in contact with the metallic ring, and an electrical conductor connecting said rod with the source of electrical supply.

3. In a sparking igniter for explosive-engines, the combination of a cylinder, electrodes extending into said cylinder and insulated therefrom, an electrical conductor extending from one of said electrodes and leading to the source of electrical supply, a rotatable cam-shaft, an insulating-disk mounted thereon, a metallic ring secured to and surrounding the disk, and provided with a contact-point projecting therefrom and adapted to make contact with the outer end of one of the electrodes on each revolution of the cam-shaft, a metallic rod having one end in contact with the metallic ring, and an electrical conductor connecting said rod with the source of electrical supply.

above mentioned thereon, a contact-point projecting therefrom and adapted to make contact with the outer end of one of the electrodes on each revolution of the cam-shaft, a metallic rod having one end in contact with the metallic ring, and an electrical conductor connecting said rod with the source of electrical supply.

4. In a sparking igniter for explosive-engines, the combination of a cylinder, electrodes extending into said cylinder and insulated therefrom, an electrical conductor extending from one of said electrodes and leading to the source of electrical supply, a brush extending from the cylinder, a rotatable cam-shaft having its bearing in an opening in the brush, an insulating-disk mounted on the cam-shaft, a metallic ring secured to and surrounding the disk, and provided with a contact-point projecting therefrom and adapted to make contact with the outer end of one of the electrodes on each revolution of the cam-shaft, a metallic rod having one end in contact with the metallic ring, and an electrical conductor connecting said rod with the source of electrical supply.

5. In a sparking igniter for explosive-engines, the combination of a cylinder, electrodes extending into said cylinder and insulated therefrom, an electrical conductor extending from one of said electrodes and leading to the source of electrical supply, a brush extending from the cylinder, a rotatable cam-shaft having its bearing in an opening in the brush, an insulating-disk mounted on the cam-shaft, a metallic ring secured to and surrounding the disk, and provided with a contact-point projecting therefrom and adapted to make contact with the outer end of one of the electrodes on each revolution of the cam-shaft, a metallic rod having one end in contact with the metallic ring, and an electrical conductor connecting said rod with the source of electrical supply.

6. In a sparking igniter for explosive engines, the combination of a cylinder, electrodes extending into said cylinder and insulated therefrom, an electrical conductor extending from one of said electrodes and leading to the source of electrical supply, a brush extending from the cylinder, a rotatable cam-shaft having its bearing in an opening in the brush, an insulating-disk mounted on the cam-shaft, a metallic ring secured to and surrounding the disk, and provided with a contact-point projecting therefrom and adapted to make contact with the outer end of one of the electrodes on each revolution of the cam-shaft, a metallic rod having one end in contact with the metallic ring, and an electrical conductor connecting said rod with the source of electrical supply.

7. In a sparking igniter for explosive-engines, the combination of a cylinder, electrodes extending into said cylinder and insulated therefrom, an electrical conductor extending from one of said electrodes and leading to the source of electrical supply, a rotatable cam-shaft, an insulating-disk mounted thereon, a metallic ring secured to and surrounding the disk, and provided with a contact-point projecting therefrom and adapted to make contact with the outer end of one of the electrodes on each revolution of the cam-shaft, a longitudinally-adjustable metallic rod having one end in contact with the metallic ring, and an electrical conductor connecting said rod with the source of electrical supply.

699,484. FULLEY. FRIEDRICH ALBERT, Furberg, Germany. Filed Sept. 12, 1900. Serial No. 51,578. (No model.)

Claim.—A pulley comprising a plurality of sections, each section consisting of a segmental rim with inward curved, smooth marginal edges, and a central peripheral bulge crowned by transverse corrugations, and also a tie-piece constituting one member of the rim and making said inward curved ends, the matching tie-pieces of the several sections being bolted together.

699,485. DUST-SPRAYING MACHINE. CHARLES E. ALLEN, Springfield, Mo. Filed Sept. 2, 1901. Serial No. 74,582. (No model.)

Claim.—1. In a dust-spraying machine, in combination with a suitable base A, of a supporting-frame 10 rising therefrom and extending rearward at the top, with a shaft 11 mounted at the top in the bearings 12 and 13, a drive-wheel 14 secured to the front end of the axle 11, with a flexible coil-spring attached to the rear end of 11 and extending down in a curve and attached to the axle 54 which latter is at right angles to said axle 11, an axle 15 mounted in a bearing 16 located midway between the top and bottom of the frame 10, a pulley-wheel 17 secured to the front end of the axle 15 and immediately under the wheel 14, said wheel 14 and 17 being connected by a band passing over each so that the wheel 17 will be revolved by the wheel 14, a hub 20, provided with paddles 21, secured on the rear end of the axle 15, with a casing 22 enclosing the latter, substantially as shown and described, a dust-box 50 located in rear of the casing 22 which is provided with an opening provided with a cap or lid 52 in the top thereof, agitators secured on the shaft 54 and adapted to be revolved inside of the said dust-box 50, a pipe 34 extending from the casing 22 underneath the paddles 21 with an opening extending up into the dust-chamber 50 with means for controlling the discharge of the dust from the dust-chamber into the pipe 34 and a flexible tube 35 with a nozzle 36 attached to the outer end of the pipe 34, all substantially as shown and described and for the purposes set forth.

2. In a dust-spraying machine, in combination with the blowing mechanism operated by the main wheel, of a dust-box located in rear thereof, of a perpendicular shaft adapted to revolve therein carrying a series of arms or agitators, said shaft being pivoted in the bottom of the dust-box in a bracket 56 and the top of said shaft being supported by the bearing 57 and passing through the center of the top of the dust-box, of the axle 54 being revolved in unison with and by the axle 11 with a flexible coil-spring connecting them substantially as shown and described.

3. A dust-spraying machine; a base, a main casting rising from the base for supporting the various mechanisms; a power mechanism, consisting of the wheels 14 and 17, the axle 11 and 15, the belt 16, and the handle 19; an air-chamber formed by the casing 22, with paddles operated by the shaft 15 revolving in said air-chamber; of a dust-box located in rear of the air-chamber with a shaft 54 revolving therein which shaft carries a multiple of agitators and is operated by the shaft 11 and at right angles thereto; of the flexible spring connecting the shafts 11 and 54 at right angles to each other; of a controlling mechanism located underneath the dust-chamber 50 adapted to be operated by the handle projecting back therefrom and adapted to be locked in the position desired; of a pipe extending from the air-chamber, underneath the dust-chamber, and thence to the rear where it is provided with a flexible hose and a nozzle; all substantially as shown and described and for the purposes set forth.

699,486. RADDER OR BUTTON BACK. JOHN W. AYERS and ALBERT H. AYERS, New York, N. Y. Filed Jan. 8, 1902. Serial No. 14,719. (No model.)

Claim.—1. A badge or button back comprising a ring of sheet material having a keeper formed thereon and a projection bent upon itself to form a stop, legs formed on the turned-back portion of the said projection and extended rearwardly through the ring and a pin adapted to said legs, the said pin being arranged to be engaged by the stop for holding the pin within its keeper under tension.

2. A badge or button back comprising a pin, a ring having a keeper for engaging the free end of the pin, a slot therethrough and a projection bent to form a stop, legs extended from the bent-back portion of the projection rearwardly through the said slot, to which the pin is biased and a shallow leg formed on the turned-back portion of the projection serving to limit the extension of the legs through the said slot.

3. A blank for badge or button backs comprising a sheet-metal ring having a keeper extended laterally therefrom, an inwardly-extended projection opposite the keeper, legs thereon and a slot formed in the ring at the base of the said projection.

4. A blank for badge or button backs comprising a sheet-metal ring having a keeper extended laterally therefrom, an inwardly-extended projection opposite the keeper, opposite extended legs thereon, a shallow leg at the end of the projection and a slot cut through the ring at the base of the projection.

699,487. MATCH-MACHINE. SMITH & BROWN, Pittsburgh, Pa. Filed Apr. 7, 1902. Renewed Mar. 2, 1900. Serial No. 78,422. (No model.)

Claim.—1. In a match-machine provided with means for receiving the splints horizontally and carrying them vertically; a composition-wheel adapted to distribute the composition to the splints, a reservoir, and means for rotating and controlling the wheel, substantially as set forth.

2. A match-machine provided with means for intermittently feeding a strip of veneer, means for dividing the veneer into splints, impelling-media for conveying the splints vertically and separately, means for applying a binding composition, and means for drying and drying the finished matches, in vertical position, heads downward, substantially as set forth.

3. In a match-machine the combination of a feed-table provided

with guiding edges, and a limiting-stop, plane lower and grooved upper feed-rollers mounted thereon, pressure-springs mounted on the table extending through the grooves of the upper roller and adapted to bear on the blank in advance of the rollers, and a reciprocating shear-knife adapted to cover splices from the blank, a splice-holding treadle and a device for removing the splices singly, substantially as set forth.

4. In a match-machine provided with a feed-table, feed-rollers mounted thereon, a limiting-stop, a shearing-knife, and a needle mechanism for removing the splices singly, substantially as set forth.

5. In a match-machine, the combination of a feed-table, feed-rollers mounted thereon, a limiting-stop, a shearing-knife, and a needle mechanism for removing the splices singly, substantially as set forth.

6. In a match-machine provided with a knife adapted to shear splices from a strip of veneer, a pointed spindle adapted to engage and remove the covered splice, substantially as set forth.

7. In a match-machine provided with a knife adapted to shear splices from a strip of veneer, a reciprocating spindle provided with a needle-point adapted to be inserted in a splice, substantially as set forth.

8. In a match-machine provided with a knife adapted to shear splices from a strip of veneer, a spindle provided with a needle-point, means for advancing the spindle to insert the needle in a splice, and means for moving the spindle, substantially as set forth.

9. In a match-machine provided with a knife adapted to shear splices from a strip of veneer, a spindle provided with a needle-point, means for advancing the spindle to insert the needle in a splice, means for moving the spindle and for giving it a partial rotation, substantially as set forth.

10. In a match-machine, provided with a feed-table, feeding-rollers, and a shearing-knife for cutting the splices, a spindle-wheel adapted to rotate in proximity to the inner end of the feed-table, a series of pointed spindles mounted thereon, and means for forcing the spindles outwardly, to engage the splices, partially rotating and returning the spindles, and then retracting them, substantially as set forth.

11. In a match-machine provided with a feed-table, feeding-rollers, and a shearing-knife for cutting the splices, a stationary disc-wheel, a spindle-wheel concentric therewith provided with a series of pointed spindles mounted thereon having blocks adapted to bear upon the disc-wheel, and cam-faces and abutments on the disc-wheel adapted to advance, partially rotate and retract the spindles, substantially as set forth.

12. In a match-machine provided with a feed-table, feeding-rollers, and a shearing-knife for cutting the splices, a spindle-wheel provided with pointed spindles, and temporary holding devices for the spindles: a splice-distributing wheel provided with arms adapted to engage the spindles and deliver them to conveying-tapes, substantially as set forth.

13. In a match-machine provided with means for delivering the splices in a vertical position to temporary holding devices: a splice-distributing wheel provided with arms adapted to engage the spindles and retaining-springs in advance of the arms, substantially as set forth.

14. In a match-machine provided with a rotatable spindle having a needle-point for delivering the splices in a vertical position to temporary holding rails and wires: a splice-distributing wheel provided with pivoted arms adapted to engage the spindles and deliver them to conveying-tapes, and means for disengaging the arms, substantially as set forth.

15. In a match-machine provided with means for delivering the splices in a vertical position to temporary holding devices, with a splice-distributing wheel provided with pivoted arms adapted to engage the spindles, retaining-springs in advance thereof, retracting-springs, and a stationary cam for disengaging the arms, substantially as set forth.

16. In a match-machine, splice-conveying mechanism consisting of a wide and narrow tape, an outwardly-curved plate having top and bottom edges forming a guide for the wide tape and a pressure-strip adapted to bear upon the narrow tape, with means for exerting elastic pressure on the strip, substantially as set forth.

17. In a match-machine, splice-conveying mechanism consisting of a wide and narrow tape, a guide for the wide tape having a recess at its middle portion, and a pressure-strip adapted to bear upon the narrow tape, with means for exerting elastic pressure on the strip, substantially as set forth.

18. In a match-machine, splice-conveying mechanism consisting of a wide tape having projecting ribs at top and bottom, a narrow tape midway of each wide tape, and a pressure-strip adapted to bear upon the narrow tape, with means for exerting elastic pressure on the strip, substantially as set forth.

19. In a match-machine, in combination with vertical splice-conveying mechanism consisting of a wide and narrow tape, a plate having top and bottom edges forming guides and an elastically-actuated pressure-strip adapted to bear upon the tapes: upper and lower adjusting-rollers adapted to bear upon the tapes and bottoms of the splices, positively driven in the same direction as the tapes, substantially as set forth.

20. In a match-machine, a composition-wheel and a reservoir, with means for rotating the wheel and imparting to it a transverse oscillatory motion, substantially as set forth.

21. In a match-machine, a grooved composition-wheel mounted on a spindle having a bearing in a sliding frame, a sliding connection with rotating gearing, and a reciprocating arm in engagement with the sliding frame and means for actuating the arm, substantially as set forth.

22. In a match-machine provided with double conveying-tapes: a storage-drum consisting of vertical staves supported on a circular inclined plate, and means for rotating the drum, substantially as set forth.

23. In a match-machine provided with double conveying-tapes: a storage-drum consisting of vertical staves mounted on a circular inclined plate forming a spiral, means for rotating the drum, and means for lowering each staff from the highest extremity of the circular inclined plate, substantially as set forth.

24. In a match-machine provided with double conveying-tapes: a revolving storage-drum consisting of staves upon which the tapes are wound, means for gradually advancing the staves throughout their revolution whereby the tapes assume a spiral direction, and means for retracting each staff at the same point, substantially as set forth.

25. In a match-machine provided with double conveying-tapes: a revolving storage-drum consisting of staves upon which the tapes are wound, means for gradually raising the staves throughout their revolution whereby the tapes assume a spiral direction, means for lowering each staff at the same point, a separating device for the tapes and a conveying-chain, substantially as set forth.

26. In a match-machine provided with double conveying-tapes and a revolving storage-drum upon which the tapes are wound spirally: guide-rollers mounted in the framework and tension-rollers with friction driving mechanism, substantially as set forth.

27. In a match-machine, double conveying-tapes disposed around guiding-rollers and meeting at a splice-receiving point, carried through vertical guiding mechanism disposed in a curve, carried spirally around a storage-drum, separated and carried around guide-rollers to tension-rollers provided with positively-driven friction driving mechanism, and over guide-rollers provided with tension devices to the meeting-point, substantially as set forth.

28. In a match-machine, a tape provided with projections of frictional material at each edge, a narrower tape traveling in the same plane between such projections, and means for holding the tapes together, substantially as set forth.

29. In a match-machine, a tape provided with projections of frictional material at each edge, a narrower tape traveling in the same plane between such projections and means for holding the tapes together and for transmitting to them forward motion, substantially as set forth.

30. A match-machine comprising a feed-table, feed-rollers mounted thereon, a splice-cutting knife, a spindle-wheel provided with means for transmitting and carrying the splices, a splice-distributing wheel adapted to deliver the splices to conveying-tapes, conveying-tapes for carrying the splices, aligning-rollers, a composition-roller, and a winding-drum, substantially as set forth.

31. A match-machine comprising a feed-table, feed-rollers mounted thereon with pressure-adjusting devices, a reciprocating splice-cutting knife, a spindle-wheel provided with pointed spindles for transmitting, carrying the splices and partially rotating them, temporary holding devices, a splice-distributing wheel adapted to deliver the splices to conveying-tapes, conveying-tapes mounted edgewise in supporting-frames, upper and lower aligning-rollers, a composition-roller submerged in a reservoir with means for rotating and oscillating the roller, a winding-drum composed of staves mounted on supporting mechanism adapted in case the conveying tapes to assume a spiral arrangement, and means for discharging the matches, substantially as set forth.

699,488. BOX. CHARLES E. BALDWIN, Brooklyn, N. Y. Filed Feb. 7, 1901. Serial No. 34,698. (No model.)

Claim.—1. A box of the character described, comprising the box proper, a tube located within said box provided with integral outwardly-

projecting extensions at its lower end secured to the bottom of the box, the said extensions being corrugated and presenting a yielding surface or cushion, and a cover for the box.

2. A box of the character described, comprising the box proper, a tube secured within said box to receive a record-cylinder thereover, a yielding cushion located in the bottom of the box around the lower end of said tube, and a cover having an annular cushion on its under side extending, when the cover is in position, around the upper end of the tube and engaging with its outer side, for the purpose set forth.

3. A box of the character described, comprising the box proper, a tube located centrally within said box with an annular opening or space between the same and the inner wall of the box, a cushion of yielding material located in the bottom of the box around the lower end of said tube, and a cover having an annular cushion on its under side which registers with the said annular opening in the box and engages at one edge thereof with the side of the tube at its upper end, for the purpose set forth.

4. A box of the character described, comprising the box proper, a tube located within said box to receive a record-cylinder thereover and being provided with an outer face of corrugated paper or similar flexible material for contact with the record-cylinder, the said tube being also provided with integral outwardly-projecting extensions at its lower end and secured to the bottom of the box and presenting an upper corrugated yielding surface for the lower end of the record-cylinder to rest upon, and a cover having an annular strip of corrugated paper or similar yielding material on its under side for engaging with the upper end of the record-cylinder.

5. A box of the character described, comprising the box proper, a tube secured within said box, a yielding cushion located in the bottom of the box around the lower end of said tube, and a cover having an annular cushion on its under side extending, when the cover is in position, around the upper end of the tube.

699,489. STEEL GRAIN-MILL. JAMES E. RALPH and JEREMY J. SMITH, Buffalo, N. Y. Filed May 4, 1901. Serial No. 35,738. (No model.)

Claim.—1. A series of bins for grain-elevators and storage-houses, each bin composed of separate corner-plates and intersected flat side sheets, the flat side sheets being secured between the contiguous corner-plates of separate adjacent bins to form an inner side wall common to any two adjacent bins.

2. A series of bins for grain-elevators and storage-houses, each bin composed of separate corner-plates and intersected flat side sheets, the flat side sheets being secured between adjacent corner-plates of the same bin to form outer side walls, and secured between the contiguous corner-plates of separate adjacent bins to form an inner side wall common to any two adjacent bins.

699,440. TOOL-GARRIAGE FOR LATHES. WILLIAM F. BARNER, Rochester, N. Y., assignor to W. F. & John Barnes Company, Rochester, N. Y. Filed Feb. 9, 1901. Serial No. 35,739. (No model.)

Claim.—In a lathe, the combination of a toothed rack and a gear, a driving-shaft, a gear connection between the shaft and rack comprising a spur-toothed pinion, and a flange-plate having a series of concentric rings of teeth, the pinion being movable into mesh with the several rings of teeth and across the face of the plate and means for holding the pinion in its adjusted position, the teeth of the intermediate rings being of double-flange form.

699,440.

699,441. SHAFT-TOO. HENRY A. BURLAY, Portsmouth, Ohio, assignor of one-half to William C. Stafford, Columbus, Ohio. Filed July 11, 1900. Serial No. 35,740. (No model.)

Claim.—In a harness and shaft connector, the combination with a hook adapted to be suspended by one end from the harness-middle and provided at its other end with an integral strap-retaining loop having a strap-protecting flange, of a reliable strap attached to the lower end of the hook and adapted to encircle a shaft and to have its free end connected in the said strap-retaining loop and to be connected to the girth to secure the shaft to the harness.

699,442. CAN FOR HOLDING COARSE GRINDING OR THE LIKE. CLARENCE W. BROWN, New York, and JAMES H. KIM, Brooklyn, N. Y., said Brown assignor to said Kim. Filed Dec. 24, 1901. Serial No. 37,000. (No model.)

Claim.—1. A can for holding coarse emery or other bottle-dressing material, having a circular bottom, an open upper end, a close-fitting removable cover for the same, and a handle in the cover, substantially as and for the purposes hereinbefore set forth.

2. A can for holding coarse emery or other bottle-dressing material, having a circular bottom, and supporting legs or projections extending below said bottom, an open upper end, a close-fitting removable cover for the same, and a handle in the cover substantially as and for the purposes hereinbefore set forth.

699,443. WRENCH. ALBERT BORN, Berlin, Prussia, assignor of one-half to John W. Currier, North Troy, Vt. Filed Mar. 1, 1901. Serial No. 35,741. (No model.)

Claim.—1. In a wrench of the class described, the combination with a fixed jaw and a cheek to which it is secured, of a movable jaw mounted to slide on said cheek intermediate the fixed jaw and tip of said cheek, and a locking collar or yoke mounted on said cheek to move bodily thereon and adapted to engage said movable jaw, substantially as described.

2. In a wrench of the class described, the combination with a fixed jaw a cheek to which it is secured and a handle secured to said cheek, of a movable jaw mounted to slide on said cheek intermediate said fixed jaw and said handle, a handle being projecting from the under side of said

movable jaw, and a locking-collar adapted to engage said jaw to lock the movable jaw in its adjusted position, substantially as described.

699,444. DEVICE FOR PREVENTING SWINE FROM ROOTING. An. SAMUEL J. BARNES, Portland, Iowa. Filed Apr. 28, 1906. Serial No. 12,047. (No model.)

Claim.—1. An implement of the character described and for the purpose described, comprising two pivotally-connected hand-levers, one being provided with a outer-block head having a flat knife-opening surface and convergent tapering sides at its extremity, and the other having a knife-attaching head, and a separately-formed knife secured at its extremities to said last-named head and having a forwardly-projecting central web-cutting portion afforded by convergent knife sections substantially parallel to the convergent sides of said opposed head, said outer-block head projecting beyond the outer, substantially as and for the purpose set forth.

2. In an implement of the character described, the combination of two pivotally-connected hand-levers, one of said levers being provided with a bifurcated head and the other with a flattened portion passing between the bifurcations of said head and having also an expanded knife-opening head provided with a flat knife-opening surface, said last-named head having forwardly-convergent sides, and a knife secured at its extremities to the bifurcations of said first-named head and having a forwardly-projecting cutting-web formed by forwardly-converging knife-sections, the said knife-opening head projecting beyond said knife, substantially as and for the purpose set forth.

699,445. SHUTTLE-CHECK FOR LOOMS. JOHN C. BRYAN, Augusta, Ga. Filed Sept. 7, 1906. Serial No. 23,266. (No model.)

Claim.—1. In a shuttle-check, the combination with a shuttle-box, of a top pressure-plate pivotally hung at a point intermediate of its ends, the outer extremity of the plate having opposite depending flanges and normally held in depressed position for contact with the shuttle, the shuttle raising the outer extremity of the plate when assuming an operative position in relation to the pick mechanism for the shuttle, and means connected to the inner extremity of the plate for restoring the same to normal position after the shuttle has passed out of the box.

2. In a shuttle-check, the combination with a shuttle-box, of a top pressure-plate pivotally mounted above the box and having the fulcrum therefor located at a point intermediate of the ends thereof, the outer end of the plate being normally depressed and the inner end elevated to respectively contact with and clear the shuttle, the shuttle raising the outer

end of the plate in passing under the lower, and means for cushioning and restoring the plate to normal position consisting of a tension-rod under spring control and a rocking element connected to said rod.

3. Mechanism of the character set forth, including a shuttle-box, and a top pressure-plate movably mounted therein having opposite depending flanges.

4. In an attachment of the character set forth, the combination with a shuttle-box, of a top oscillable pressure-plate pivotally mounted above the box and adapted to have its outer extremity bear upon the shuttle, a rod attached to the inner extremity of the plate and having adjusting-nuts on the lower end thereof, a rocking element having an ear through which the lower end of the rod extends, the upper nut having contact with the upper side of the ear, and a spring on the lower end of the rod between the said ear and the lower nut.

699,446. SCREW-CUTTING TOOL. JAMES J. BAKER, Hartford, Conn. Filed Oct. 31, 1906. Serial No. 29,047. (No model.)

Claim.—1. A screw-cutting implement comprising sets of independent dies arranged in columns, each die being constructed to thread a different gage of work, and means for adjusting said dies, so that the die it is desired to employ may be utilized for threading the work for which it is intended while the other dies are withdrawn and do not interfere with the passage of said work.

2. A screw-cutting implement comprising sets of independent, sectional dies arranged in columns, the dies being of different sizes and each die being adapted to thread work independent of the work threaded by any other die; means for adjusting said dies; and means for guiding the work to the dies in use.

3. In a screw-cutting tool, the combination, with a chambered die-stock, of pairs of superimposed dies, each of a die for threading a different diameter of work, mounted in the chamber of said stock; means for clamping the dies in position; a work-guide; and telescopic bushings adapted to be fitted within said work-guide.

4. In a screw-cutting tool, the combination, with a chambered die-stock of slotted dies arranged in superimposed pairs within the chamber

of said stock, each pair of dies being of a size different from the other pairs of dies; both passing through the slots of the dies; and means for individually adjusting the dies.

5. In a screw-cutting tool, the combination, with a die-stock of pairs of dies fitted for adjustment on said stock, each pair being of different gages from any other pair; means for clamping the dies together in column; means for individually adjusting the dies; and means for guiding the work.

6. In a screw-cutting tool, the combination, with a chambered die-stock, of dies arranged in column at each end of the chamber of said stock, each die being of different size from any other die of said column; means for clamping said dies in place; and means for adjusting the dies.

7. In a screw-cutting tool, the combination, with a chambered die-stock having side plates, of dies arranged in column between said plates, each die being of a size adapted to thread a certain gage of work different from the gages threaded by any other die; means for clamping the dies in place; and means for adjusting the dies.

8. In a screw-cutting tool, the combination, with a die-stock having slotted side plates and a work-guide, of pairs of dies, each pair being of different gages from any other pair arranged in column at each end of the chamber between said plates; both passing through slots in the dies and threaded at one end into the stock; and means for individually adjusting the dies.

9. In a screw-cutting tool, the combination, with a die-stock having eight openings, of pairs of dies of different gages mounted in a chamber of said stock, the dies being arranged in column; and means for adjustably securing said dies in position.

10. In a screw-cutting tool, the combination, with a die-stock having a chamber, of dies of a construction adapted to thread different classes of work, arranged in column within said chamber; extensions adjacent to the ends of said chamber; screws threaded through the extensions and bearing against the dies; and means for clamping the dies in place.

11. In a screw-cutting tool, having a work-guide, the combination, with said guide, of screws passing through the walls of the guide; telescopic bushings fitted within the guide; superimposed pairs of dies, each pair being of a size to fit a different gage of work from any other pair.

699,447. FEEDING-CLUTCH. MALCOLM CAMPBELL, Boston, Mass. Filed Dec. 14, 1906. Serial No. 33,051. (No model.)

Claim.—1. In a friction-clutch, a normally rotating clutch member having two friction-surfaces, a member having friction mechanism to engage one of said surfaces, a worm for actuating said mechanism, and a member in sliding engagement with said worm, and provided with means for frictionally engaging the other surface of the normally rotating clutch member, and with speed-controlled positive clatching means for engaging said normally rotating clutch member.

2. In a friction-clutch, a normally rotating clutch member having a friction-surface, a member having a complementary friction-surface to engage the first-mentioned friction-surface and having a movable positive clatching device operative by centrifugal action to positively engage the first-mentioned clutch member when the second-mentioned member reaches a predetermined speed of rotation, said normally rotating clutch member having means to be engaged by said positive clatching device.

3. In a clutch, a normally rotating clutch member having a friction-surface, and one or more ratchet-teeth, and a member adapted to frictionally engage the said friction-surface, said member being provided with a pawl operative by centrifugal action when the said second member reaches a predetermined speed of rotation to engage the teeth or teeth on the said normally rotating clutch member.

4. In a friction-clutch, a normally rotating clutch member having two friction-surfaces, a member having relatively movable friction-surfaces to engage one of the friction-surfaces, means for actuating said member in

clutching a worm rotatable independently of the clutch-carrying member, and a third member rotatable with the second mentioned member, but adapted to slide thereon, the said third member having means for frictionally engaging the first-mentioned member, and speed-controlled means for positively engaging the first-mentioned member.

5. In a friction-clutch, a normally rotating clutch member having a friction-surface, a second member having relatively movable friction-surfaces to engage the friction-surface of the first-mentioned member, means for actuating said second member, including a worm rotatable independently of the clutch-carrying member, a third member for connecting the worm to and disconnecting it from the first-mentioned normally rotating clutch member, and a yieldingly-mounted shifting lever having friction mechanism for retarding the rotation of the said third member, whereby the relative movement of said worm mechanism is reversed and the friction-surfaces separated.

6. In a friction-clutch, a normally rotating clutch member, a second member having friction mechanism for engaging the first-mentioned member, a third member for operating the friction mechanism, and means for retarding the rotation of the said third member for reversing the operation thereof, said retarding means including a yieldingly-mounted shifting lever, friction-shoes on said lever, and means for affecting the engagement of said shoes with said third member.

699,448. PUMP. ALEXANDER S. CARDWELL, Elmwood, N. Y., assigner of one-half to Wesley Parrott Loomis, Kalamazoo, Mich. Filed Mar. 26, 1901. Serial No. 63,991. (No model.)

Claim.—1. In a pump, the combination with a rotatable cylinder, of a piston therein provided with suitable connections for its reciprocation and a spring-actuated piston contiguous to the first piston and provided with a spring tending to press it against said first piston whereby said spring-actuated piston is moved positively in one direction by the first piston and is moved in the opposite direction by the spring; substantially as described.

2. In a pump, the combination with a suction-pipe containing a series of check-valves opening upward, of a branch pipe connected therewith above the upper check-valve, said branch pipe also containing a check-valve opening upward, a cylinder connected with said suction-pipe above the branch pipe, an upwardly-pressing spring in said cylinder, a spring-actuated piston pressed upward by said spring and containing a perforation provided with an upwardly-opening check-valve, a positively-driven piston above the spring-actuated piston, also perforated, containing a check-valve, and suitable connections for positively reciprocating said second piston; substantially as described.

699,449. CULTIVATOR. FRANK R. CHAMBERLAIN, Concord, N.H., assigner of one-half to Edwin Childers, deceased. Filed May 21, 1901. Serial No. 63,994. (No model.)

Claim.—1. In a cultivator, having transversely-adjustable gangs connected to move simultaneously, the combination of a wing-beam laterally adjustable having means for carrying cultivating instrumentalities with each gang all for the purpose described.

2. The combination in a cultivator of a center frame, carrying cultivating instrumentalities, a cross-bar carrying transversely-adjustable gangs having wing-beams carrying cultivating instrumentalities adjustable laterally to the said gangs, all for the purpose set forth.

3. The combination in a cultivator having transversely-adjustable gangs connected to move simultaneously, of a center beam carrying a cross-bar engaging said gangs, a lever pivoted thereon, a draft-bar sliding or suspended to said frame, means adjustable to receive draft connections engaging said gangs, laterally-adjustable wing-beams carrying cultivating instrumentalities, all substantially as described and for the purpose set forth.

699,450. DEVICE FOR CORRECTING COMPASS ERRORS. JAMES CHERRYMAN, San Francisco, Cal. Filed Mar. 11, 1901. Serial No. 69,396. (No model.)

Claim.—1. An apparatus for correcting compass errors and the like, consisting of the weighted horizontally-suspended counterbalance-rings, a compass and degree subdivided ring turnable horizontally within the inner of the two rings, another ring turnable horizontally within the compass-ring, a ring journaled across the open center of the inner ring and having clock-subdivisions on its face, said ring having its axis substantially in the

horizontal plane of the other rings, and being tiltable to show an inclination with relation to the horizontal rings, a centrally-pivoted needle turnable in the plane of the clock-ring, having a member with a central vertically-marked surface, and a shadow-pin carried by the needle and adapted to cast a shadow upon said member.

2. An apparatus for correcting compass errors and the like consisting of two rings pivoted at right angles with each other, with a counterbalance-weight whereby an essentially horizontal position of the inner ring may be maintained, a ring turnable horizontally with relation to the inner ring having degree and compass subdivisions marked upon it, another ring turnable horizontally with relation to the compass-ring, a ring pivoted within said last-named ring and turnable about its pivot to change its plane with relation to said rings, and an indicating-segment fixed thereto, subdivided to show the ship's altitude, in combination with a centrally-pivoted needle turnable in the plane of the clock-face having a shadow-pin perpendicular to it, a centrally-fixed inclined and marked surface upon which the shadow of the pin is caused to fall and a pointer turnable in unison with said third-named ring and movable over the degree-divided ring to indicate the compass error.

3. In an apparatus for indicating compass errors and the like, the universally balanced and suspended rings by which a horizontal position of the apparatus is maintained, a compass and degree divided ring turnable in the same plane with the innermost of the counterbalance-rings, a ring turnable with relation to the compass and degree ring having a pointer extending over the degree-markings, a ring having its circumference divided into two equal clock-faces for forenoon and afternoon use, said ring having its axis substantially in the horizontal plane of the last-named horizontal ring, and turnable to stand at any angle of inclination with relation thereto, a segment fixed at right angles to said clock-ring and extending through the open center of the adjacent ring, and subdivided in degrees whereby the angle of inclination is indicated, a centrally-pivoted needle turnable in the plane of the clock-face and movable over the subdivisions thereof, a shadow-pin perpendicular to and carried by said needle, a vertically-inclined shadow-plate upon said needle and turnable in unison therewith, said plate having a marked surface and a central line or sight adapted to coincide with the shadow-pin.

4. In an apparatus for determining compass errors, the combination of a horizontally-supported and movable ring having compass and degree markings thereon, an another support within and movable in the plane of this compass-ring, a ring with clock-face markings thereon pivoted within the said another support, and adapted when horizontal to lie in the same plane with said support and compass-ring, a needle pivoted centrally of said clock-face ring or hour-circle, and movable over said clock, a pin carried by said needle, a surface upon said needle whose plane is disposed at right angles to a plane which includes the shadow-pin, and markings on said surface with which the shadow of the pin is adapted to coincide.

5. An improved apparatus for correcting compass errors and the like, including a ring in which the compass and degree circle of the apparatus are turnable in the same plane, said support-ring being pivoted in an outer ring, and said outer ring pivoted at right angles therewith upon a support whereby universal movement and a constant horizon of the inner portion of the apparatus is obtained, an inner ring having clock-face markings said last-named ring, when horizontal, adapted to lie in the same horizontal plane with said support and compassing-arms converging downwardly from the inner support-ring, a counterbalance-weight centrally and removably carried thereby, a means for locking the parts to prevent movement consisting of a fulcrumed lever, a screw-rod by which it is moved, the inner end of said lever having a device adapted to interlock with the lower part of the counterbalance device.

699,451. HYDRAULIC STEERING MECHANISM. JAMES CHERRYMAN, San Francisco, Cal. Filed Nov. 15, 1901. Serial No. 69,402. (No model.)

Claim.—1. The combination in a steering mechanism of hydraulic cylinders pivoted at one end, and having connections through said end with a fluid-supply, means connecting the pivot end of one cylinder with the like end of a second cylinder whereby the fluid may flow from one cylinder to the other, a rudder-stock with which the piston-rods of said cylinders are connected, a source of fluid-supply, means by which the admission of fluid to the cylinder is controlled, and means whereby the movement of the rudder is limited automatically.

2. The combination in a steering mechanism of hydraulic cylinders, connections between said cylinders having connection through one end with a source of fluid-supply, means connecting the end of one cylinder with a corresponding end of another cylinder whereby the fluid may flow from one cylinder to the other, and a rudder-stock, a source of fluid-supply in conjunction with said cylinders, means for controlling the admission and exhaust of said cylinders, and means whereby the movement of the rudder beyond a certain point in either direction is controlled automatically and independent of the operator.

3. The combination is a steering mechanism of oscillating hydraulic cylinders, having connection through their pivot ends with a source of fluid-supply, and means connecting the cylinders whereby the fluid may flow from one cylinder to the other, pistons reciprocable within said cylinders, piston-rods connected with the stock of the rudder, means for controlling the flow to and from said cylinders whereby the pistons are actuated to move the rudder, and means upon the rudder-stock whereby said flow may be automatically checked when the rudder has swung a certain distance in either direction.

4. The combination is a steering mechanism of oscillating cylinders having connection through their pivot ends with a source of fluid-supply, pipes or passages connecting the pivot end of one cylinder with a like end of a second cylinder whereby the fluid may flow from one cylinder to the other, pistons movable within the cylinders, piston-rods connected with the rudder-stock, a source of fluid-supply, means for controlling the admission and exhaust of fluid to the cylinders, a segment carried on the rudder-stock, gearing with which said segment engages and connections between said gearing and the means controlling said admission and exhaust whereby said flow of fluid may be checked automatically.

5. The combination is a steering mechanism of hydraulic cylinders having their pistons connected with the rudder-stock, said cylinders having their pivot ends connected with a source of fluid-supply, and means connecting the pivot end of one cylinder with a like end of a second cylinder, for transferring the fluid from one cylinder to the other, a source of fluid-supply, a valve by which the flow of fluid to and from the cylinders is controlled, a tiller-wheel, connections between said tiller-wheel and valve, connections between the rudder-stock and said valve-operating mechanism whereby the valve may be actuated automatically and independently of the tiller-wheel.

6. The combination is a steering mechanism of hydraulic cylinders operatively connected with the rudder-stock, said cylinders having their pivot ends connected with a source of fluid-supply, and means connecting the pivot end of one cylinder with a like end of a second cylinder, for transferring the fluid from one cylinder to the other, supply-pipes for said cylinders, a source of fluid-supply, a valve by which the flow of fluid through said pipes is controlled, a tiller-wheel, a shaft upon which said wheel is fixed, said shaft having a rotatable and longitudinal movement, a ball-crank lever engaging therewith, connecting-rods between said lever and said valve, a segment on the rudder-stock, gearing and connections between said segment and said rods whereby the valve may be moved independently of the movement of the ball-crank tiller-wheel shaft.

7. In a hydraulic steering apparatus, the combination of a tiller-wheel, a shaft upon which said wheel is fixed, a rotatable sleeve, said shaft and sleeve being independently turnable and said shaft capable, also, of a longitudinal movement, connections between the rudder-stock and said sleeve whereby the latter is turned as the rudder moves and an indicator

operated by the movement of the sleeve which indicator shows the relative position of the rudder.

8. In a steering mechanism, the combination of hydraulic cylinders, supply-pipes entering said cylinders, a valve by which the flow through said pipes is controlled, a tiller-wheel, a shaft upon which said wheel is fixed, a sleeve including and turnable independently of said shaft, said shaft having a movement longitudinally in relation to said sleeve, a ball-crank lever adapted to be actuated by the longitudinal movement of the shaft, connecting-rods between said lever and the above-mentioned valve, said rods intermediately connected to a short lever having one end pivoted to a slidable block, resilient supports for said block and connections between the rudder and said block whereby the latter is moved to actuate said valve automatically.

9. A steering mechanism consisting in combination of oscillating cylinders, pistons movable therein, piston-rods connected with the rudder, fluid-supply pipes entering the cylinders, a valve by which the flow through said pipes is regulated, means for operating said valve, a segment carried by the rudder-stock, an indicator, connections between said segment and indicator whereby the latter is moved to show the relative position of the rudder, a traveling arm carried by said connecting means, said arm adapted to engage the valve-operating mechanism to move said valve automatically.

10. In a steering mechanism, the combination of hydraulic cylinders pivoted at one end and having their piston-rods connected with the stock of a rudder, passages formed in the pivots through which fluid is admitted to the cylinders and connections between the cylinders whereby fluid may flow from one cylinder to the other.

11. In a steering mechanism the combination of oscillating cylinders, pistons movable therein, piston-rods connected with a yoke on the rudder-stock, means for admitting fluid to said cylinders to move their pistons, pipes connecting the cylinders and valves in said pipes which are adapted to be opened and allow fluid to pass from one cylinder to the other when excessive pressure is exerted in either of said cylinders.

12. In a steering mechanism the combination of oscillating hydraulic cylinders operatively connected with the rudder-stock, said cylinders having connections through their pivot ends and their pivots with a source of fluid-supply, connecting-pipes between the cylinders, and relief-valves in said pipes.

13. In a hydraulic steering mechanism the combination of cylinders pivoted at one end and having their piston-rods connected with a yoke on the rudder-stock, a hollow extension on the pivot end of each cylinder and communicating with the cylinder-chamber, sleeves on said extensions turnable about the pivots of the cylinders, a passage-way in each of said pivots, in continuous register with the channel in said extension, a pipe connecting said passage-ways, relief-valves interposed in said pipe, and supply-pipes entering said connecting-pipes on either side of said valves.

14. A hydraulic steering mechanism consisting in combination of oscillating cylinders having their piston-rods operatively connected with the rudder-stock, communications between the cylinder-chambers and a source of fluid-supply through the pivots of the cylinders, said source of supply comprising a pressure-reservoir, a valve-chamber, pipes leading from said reservoir and to said cylinders, a slide-valve controlling the flow through the latter pipes, said valve adapted when in a control position between the ports leading to said pipes to uncover each port slightly, and means by which said valve may be moved to admit or discharge fluid to or from the cylinders.

15. A hydraulic steering mechanism consisting in combination of oscillating cylinders having their piston-rods operatively connected with the rudder-stock, communications between said cylinders and a source of supply, a slide-valve by which the flow of fluid to the cylinders is controlled, a rod attached to said valve, a short lever to which the other end of the rod is pivoted, a resiliently-supported and slidable block to which the other end of the lever is pivoted, a tiller-wheel, a shaft upon which said wheel is fixed, connections between said lever and wheel whereby said lever may be actuated to operate the valve by the movement of the wheel, a trip member operable by the movement of the rudder, said member adapted to engage the slidable block when the rudder has swung a certain distance in either direction, said engagement serving to move the before-mentioned valve independently of the operation of the tiller and so automatically check the flow of fluid to the cylinders.

16. In a hydraulic steering mechanism, the combination of cylinders pivoted at one end, pistons movable in said cylinders, piston-rods connected with a yoke on the rudder-stock, channels formed in the pivots, and passages in the cylinder-heads connecting said channels and the cylinder-chambers through which fluid may be delivered to and discharged from said chambers.

399,459. FLANK-LAMP. GEORGE WILLIAMS, South, England, assignor of one-fifth to Arthur Gladwell, South, England. Filed Sept. 12, 1891. Serial No. 72,600. (No model.)

Claim.—1. A flash-lamp comprising a narrow elongated tray, an ejector-casing in which said tray is moved vertically, springs within said casing for moving the tray upward in said casing, a trigger mechanism for holding the tray with the springs compressed at a point considerably within the casing and steps or abutments for limiting the outward movement of the tray, said casing having at its upper end about its elongated mouth a narrow channel extending about it for a wick and for receiving a combustible fluid, substantially as described.

2. A flash-lamp comprising a narrow elongated tray, an ejector-casing in which said tray is moved vertically, springs within said casing for moving the tray upward in said casing, a trigger mechanism for holding the tray with the springs compressed at a point considerably within the casing and steps or abutments for limiting the outward movement of the tray, said casing having at its upper end about its elongated mouth a narrow channel extending about it for a wick and for receiving a combustible fluid, said steps comprising bolts connected with the tray and disposed at different points along the same, and a floor against which the bolt-heads strike, said trigger mechanism being arranged substantially centrally of the tray, substantially as described.

699,458. WEIGHING-MACHINE. GEORGE E. COHEN, Ash Grove, Mo. Filed June 12, 1901. Serial No. 64,617. (No model.)

Claim.—1. The combination of means commanding a source of material supply, a scale-beam in two parallel parts, one of which is formed with a value-graduation and the other of which is formed with two graduations, one of which is a price-graduation, a pen on the value-graduation, a platform adjustably connected with the part of the scale-beam having the two graduations and at the price-graduation, a counterbalance-pen on the other graduated portion of the said beam and coacting with the platform in the manner specified, and means actuated from the scale-beam for controlling the device for commanding the source of material supply.

2. The combination of a main sliding valve-plate having two orifices therein, a supplemental sliding valve-plate arranged to command one of the orifices in the main valve, and mechanism for successively actuating the valve-plates.

3. The combination of a main sliding valve-plate having two orifices therein, a supplemental sliding valve-plate commanding one of the orifices

of the main valve, independent devices for actuating the valve-plates, and weighing devices connected with said valve-actuating devices to successively operate the same.

4. The combination of a source of material supply, a main sliding valve-plate commanding the same and having two orifices therein, a supplemental sliding valve-plate commanding one orifice of the main valve-plate, weighing devices, and means for independently operating the valve-plates, said means being successively actuated from the weighing devices.

5. The combination of a main valve-plate having two orifices, a supplemental valve-plate commanding one of the said orifices, means for opening the main valve, means for opening the supplemental valve, the supplemental-valve-opening means being actuated from the main valve, and independently-operated devices for returning the valves to closed position.

6. The combination of a weighing device, a lever, a spring actuating the lever, the lever being arranged to be moved contrary to the spring by the weighing device, a valve, a trigger-plate, controlled by the lever, and a connection between the valve and trigger-plate.

7. The combination of two independently-operated valves, two spring-pressed levers, a trigger-plate actuated by each lever, a means connected with each valve, said means being respectively releasably held by the trigger-plates, and a weighing device actuating the levers against the action of their springs.

8. The combination of a scale-beam, a lever adapted to be moved in one direction by the beam, a pivoted arm, a spring connected with the lever and arm, a scale bearing graduations corresponding to the graduations of the scale-beam, and means for adjusting the free end of the arm across the said scale, as set forth.

9. The combination of a valve, means tending to close it, a rod connected with the valve, a latch serving to engage and hold the rod, a rock-shaft, a part of which is engageable with the latch to release it, a trigger-plate releasably holding a part of the rock-shaft, a weighing device, and means actuated by the weighing device for moving the trigger-plate to release the rock-shaft.

10. In a weighing-machine, the combination with a scale-beam, of a spring-actuated valve-plate having a major and minor orifice, a locking device controlled by the scale-beam for locking the valve-plate with its major orifice in position to receive the discharge, a supplemental valve controlling the minor orifice of said plate, and means controlled by the scale-beam for operating the supplemental valve to cause it to close the said minor orifice, as set forth.

11. In a weighing-machine, the combination with a scale-beam, of a main valve having a major and a minor orifice, a supplemental valve controlling the minor orifice of the main valve, a locking device for locking the main valve in position, means controlled by the scale-beam for releasing the locking device, a locking device for the supplemental valve, and means controlled by the scale-beam for releasing the locking device of the supplemental valve, as set forth.

12. In a weighing-machine, the combination with a scale-beam, of a main valve having a major and a minor orifice, a supplemental valve for the minor orifice of the valve, levers arranged under the scale-beam, and arranged to follow the movement thereof, a locking device for the main valve, means controlled by one of the said levers for releasing the locking device, a locking device for the supplemental valve, and means controlled by the other lever for releasing the locking device of the supplemental valve, as set forth.

13. In a weighing-machine, the combination with a scale-beam, a main valve having a major and a minor orifice, and a supplemental valve for the minor orifice of the main valve, of two spring-actuated levers arranged under the scale-beam, a sliding and spring-pressed rod connected with the main valve, a latch for engaging the said rod, means controlled by one of the levers for releasing the latch from the said rod, a locking device for the supplemental valve, and means controlled by the other lever for releasing the locking device of the supplemental valve, as set forth.

14. In a weighing-machine, the combination with a scale-beam, a main valve having a major and a minor orifice, and a spring-pressed supplemental valve for the minor orifice of the valve and working at right angles to the said valve, of two pivoted and spring-pressed levers arranged under the scale-beam, one of the levers being arranged to swing higher than the other, a sliding and spring-pressed rod connected with the main valve, a pivoted latch for engaging the said rod, means controlled by one of the levers for releasing the latch, a rock-shaft provided with means for engagement with the supplemental valve for locking the same in position, and means controlled by the other lever under the scale-beam for operating the rock-shaft, as set forth.

15. In a weighing-machine the combination with a scale-beam, and a spring-pressed valve-rod, of a spring-actuated member under the scale-beam, a spring-pressed latch for locking the valve-rod, a rock-shaft, means controlled by the spring-pressed member for locking the rock-shaft, and means carried by the rock-shaft for holding the latch disengaged from the valve-rod, as set forth.

16. In a weighing-machine, the combination with a scale-beam, and a spring-pressed valve-rod, of a spring-pressed lever under the scale-beam, a spring-pressed latch for locking the valve-rod, a rock-shaft provided with arms one of which is adapted to hold the latch disengaged from the valve-rod, and a trigger-plate connected with the lever and with which the other arm of the rock-shaft engages, as set forth.

17. In a weighing-machine, the combination with a scale-beam, and a spring-pressed valve-rod, of a pivoted and spring-pressed lever under the scale-beam, a pivoted and spring-pressed latch for locking the valve-rod, a rock-shaft provided with arms one of which is adapted to hold the latch out of engagement with the valve-rod, a pivoted and spring-pressed trigger-plate connected with the said lever and with which the other arm of the rock-shaft engages, and means for limiting the swinging movement of the trigger-plate, as set forth.

18. In a weighing-machine, the combination with a scale-beam, and a spring-pressed valve-rod provided with a detent, of a pivoted and spring-pressed lever under the scale-beam, a pivoted and spring-pressed latch for locking the valve-rod, a rock-shaft provided with arms, one of which is adapted to hold the latch out of engagement with the valve-rod, a pivoted and spring-pressed trigger-plate connected with the lever and with which the other arm of the rock-shaft engages, a bar loosely mounted on the rock-shaft, and with which the detent of the valve-rod is adapted to engage, and a spring having one end secured to the shaft and the other to the bar, as set forth.

19. In a weighing-machine the combination with a scale-beam, and a spring-pressed valve, of a pivoted and spring-pressed lever under the scale-beam, a rock-shaft provided with an arm, a trigger-plate connected with the said lever and with which the arm of the rock-shaft engages, a locking device for the said valve, and means for operating the locking device from the rock-shaft, as set forth.

20. In a weighing-machine the combination with a scale-beam, and a spring-pressed valve, of a pivoted and spring-pressed lever under the scale-beam, a rock-shaft provided with an arm, a trigger-plate connected with the said lever and with which the arm of the rock-shaft engages, a second rock-shaft provided with an arm for engaging the valve, and means for operating the second rock-shaft from the first, as set forth.

21. In a weighing-machine the combination with a scale-beam, and a spring-pressed valve, of a pivoted and spring-pressed lever under the scale-beam, a rock-shaft provided with arms, a trigger-plate connected with the lever and with which one of the arms of the rock-shaft engages and a second rock-shaft provided with arms one of which engages the valve, and the other an arm of the first-named rock-shaft, as set forth.

22. In a weighing-machine the combination with a main valve-plate having a major and a minor opening, and means for operating the same, of a supplementary valve-plate for controlling the minor opening and operating transversely to the main valve-plate, and a pivoted and spring-pressed bell-crank lever having one member connected with the supplementary valve-plate and its other member adapted to be engaged by the main valve-plate, as set forth.

23. In a weighing-machine the combination with a "main" valve-plate having a major and a minor opening, and means for operating the same, of a supplementary spring-pressed valve-plate for controlling the minor opening and operating transversely to the main valve-plate, a pivoted bell-crank lever, a link connecting one member of the lever with the supplementary valve-plate, and a spring having one end secured to a fixed support and its other end to the other member of the bell-crank lever, the member of the bell-crank lever to which the spring is secured being adapted to be engaged by the main plate, as set forth.

24. In a weighing-machine, the combination with a main valve-plate having a major and a minor opening, and means for operating the same, of a supplementary and spring-pressed valve-plate for controlling the minor opening and operating transversely to the main valve-plate, a pivoted and spring-pressed bell-crank lever having one member connected with the supplementary valve-plate and its other member adapted to be engaged by the main valve-plate, and a locking device for holding the supplementary valve-plate open, as set forth.

25. In a weighing-machine the combination with a scale-beam, and levers arranged transversely under the scale-beam, of a pivotally-mounted arm, springs secured to said arm and to the levers, a scale, and means for adjusting the arm with respect to the scale, as set forth.

26. A weighing-machine, comprising a scale-beam, a platform connected with the scale-beam, a hopper, a spring-pressed main valve-plate having a major and a minor opening, means for holding said plate with its major opening in register with the hopper, a spring-pressed supplementary valve-plate for controlling the minor opening of the main valve-plate, means controlled by the scale-beam for releasing the main valve-plate whereby the minor opening thereof will be brought into register with the hopper, a locking device for holding the supplementary valve-plate from over the minor opening of the main valve-plate, and means controlled by the scale-beam for releasing the locking device, as set forth.

27. A weighing-machine, comprising a scale-beam, a platform connected with the scale-beam, a hopper, a spring-pressed main valve-plate having a major and a minor opening, a locking device for holding the said plate with its major opening in register with the hopper, a spring-pressed supplementary valve-plate for controlling the minor opening of the main valve-plate, said supplementary valve-plate working at right angles to the main plate a locking device for holding the supplementary valve from over the minor opening on the main valve-plate, two spring-pressed levers arranged under the scale-beam, a swinging and spring-actuated arm for releasing the locking device of the main and supplementary valve-plates, and means controlled by the said levers for holding the arms in inactive positions, as set forth.

28. A weighing-machine, comprising a scale-beam, a platform connected therewith, a hopper, a spring-pressed main valve-plate having a major and a minor opening, a locking device for holding the main valve-plate with its major opening in register with the hopper, a spring-pressed supplementary valve-plate for controlling the minor opening of the main valve-plate, said supplementary valve-plate working at right angles to the main valve-plate, a locking device for holding the supplementary valve-plate from over the minor opening of the main valve-plate, two spring-pressed levers arranged under the scale-beam, a swinging and spring-actuated arm for releasing the locking device of the main valve-plate, means controlled by one of the said levers for locking the said arm in inactive position, a second swinging and spring-pressed arm, means controlled by the other lever for holding the last-named arm in inactive position, and means for releasing the locking device of the supplementary valve-plate from the said second swinging arm, as set forth.

29. A weighing-machine, comprising a scale-beam, a platform connected therewith, a hopper, a main valve-plate having a major and a minor opening, a spring-pressed and sliding rod connected with the valve-plate, a pivoted latch for engaging the sliding rod to hold the valve-plate with its major opening in register with the hopper, a spring-pressed supplementary valve for controlling the minor opening of the main valve-plate, said supplementary valve-plate working at right angles to the main valve-plate, a rock-shaft provided with an arm for engaging the supplementary valve-plate to hold it from over the minor opening of the main valve-plate, two spring-pressed levers arranged under the scale-beam, a rock-shaft provided with arms, one of which is adapted to engage the latch to release it, a trigger-plate connected with one of the levers and with which the other arm of the rock-shaft is adapted to engage, a second rock-shaft provided with arms, one of which is adapted to operate the rock-shaft which locks the supplementary valve-plate, and a second trigger-plate connected with the other lever and with which the other arm of the rock-shaft is adapted to engage, as set forth.

689,454. CULTIVATOR ATTACHMENT. FRANK D. COOK, Torrington, Cal. Filed Jan. 22, 1902. Serial No. 91,654. (No model.)

Claim.—1. A cultivator consisting in combination of a main plow-frame, a supplemental lateral frame pivoted thereon, plows or shovels adjustable on the lateral frame, a segmentally-flanged plate upon the main frame, a clavis pivoted thereon, said flange concentric with the pivot of said clavis, means for rotating said clavis and flange so that the former may stand at any desired angle in relation to the axis of the cultivator, and a collar carried by said clavis.

2. In a cultivator, the combination of main and supplemental plow-frames of a clavis attachment upon the main frame consisting of upper and lower plates united to said frame, a clavis pivoted thereon, said upper plate having a segmental flange concentric with the pivot of said clavis, perforations in said clavis and flange, and means for securing said parts rigidly together.

3. The combination in a cultivator with the main frame thereof, of a pivoted, supplemental, lateral frame, shovels or plows carried by said frame, and means including a spring member by which said lateral frame may be maintained at a distance from the main frame.

4. The combination in a cultivator of a main plow-frame, a transverse support carried thereby, and a supplementary spring-pressed plow-frame pivoted to said support, said frames adapted to straddle a row.

5. The combination in a cultivator of a main frame, a transverse bar secured thereto, a spring-pressed arm pivoted to the end of said bar and pivoted to the end of said bar, a standard having an adjustable tilting and vertical movement secured to said bar and pivoted to the end of said bar.

6. The combination in a cultivator of a main frame, a transverse bar adjustably secured to the forward end of said frame, an arm pivoted to the end of said bar, a standard having an adjustable tilting and vertical movement secured to said bar and pivoted to the end of said bar.

7. The combination in a cultivator of a main frame, a supplemental lateral frame secured thereto but adapted to have an intervening space therebetween, pivots or shovels carried adjustably on said lateral frame, and spring means by which the two frames are normally separated.

8. The combination in a cultivator of a main frame, a transverse bar adjustably secured to said frame, a segmental projecting extension of said bar, an arm pivoted at the end of said extension, a spring adapted to press said arm outwardly from the frame, a pivot or shovel adjustably carried on the rear end of said arm, a guide-rod extending outwardly from the frame and adapted to support the shovel end of said arm, means by which the outward or divergent movement of said arm may be limited and means connecting with the handle of the frame by which the arm may be drawn in toward the frame.

9. A cultivator consisting in combination of a main frame, a guide-rod extending outwardly from the forward portion of said frame, an arm pivoted to said bar, a spring by which said bar is normally held away from said frame, pivots or shovels adjustably carried on the end of said arm, means connecting with the handle by which the bar may be drawn in toward said frame, a curved flanged plate secured to the frame, a shovel pivoted on said plate and adapted to be held at any desired angle in relation to the axis of the cultivator and a collar carried on said shovel.

699,455. COVERING HOSE AND ELECTRIC SIGNALING DEVICES. HARRISON T. CHASE, New York, N. Y. Filed Mar. 4, 1908. Serial No. 69,773. (No model.)

Claim.—1. A hose having two wires embedded therein out of contact with each other, and contact-plugs arranged on the inside and outside respectively of the hose and each connected with one of the said wires.

2. A hose having two wires embedded therein out of contact with each other, contact-plugs arranged on the inside and outside respectively of the hose at the end thereof and each connected with one of said wires, a conducting-ring arranged within the hose in contact with one of said plugs, and a coupling-section arranged on the outside of the hose and in engagement with the other contact-plugs.

3. A hose having two wires embedded therein out of contact with each other, contact-plugs arranged on the inside and outside respectively

of the hose at the end thereof and each connected with one of said wires, a conducting-ring arranged within the hose in contact with one of said plugs, a connecting member in electrical connection with said ring and arranged to project into an adjacent hose-section to engage the ring thereof, and a coupling-section arranged on the outside of the hose and in engagement with the other contact-plugs.

4. A hose having two wires embedded therein out of contact with each other, contact-plugs arranged on the inside and outside respectively of the hose at the end thereof, and each connected with one of said wires, a conducting-ring arranged within the hose in contact with one of said plugs, a connecting member detachable in and out of the hose at the end thereof and in electrical connection with the said ring, said connecting member being arranged to project into an adjacent hose-section to engage the ring thereof, and a coupling-section arranged on the outside of the hose and in engagement with the other contact-plugs.

5. A hose, having a wire embedded therein, contact members connected with the ends of the wire and arranged on the inside of the hose, and a coupling-section in electrical connection with one of said contact members and arranged to project into an adjacent hose-section, to engage the contact member thereof.

6. The combination of two hose-sections each having two insulated conductors embedded therein, one conductor having its ends exposed on the inner surface of the hose, and the other on the outer surface thereof, the shunting ends of the hose-sections being turned over or bent outwardly, forming flanges, means for connecting electrically the conductors exposed on the inner surface of the hose, and a coupling in electrical connection with the other conductors and having projections extending into the space between the bodies of the hose-sections and the flanges thereof, and portions engaging the outer surfaces of said flanges, to press the hose ends together tightly and prevent short-circuiting by leaks.

7. The combination of hose-sections each having two insulated conductors embedded therein, one conductor having its ends exposed on the inner surface of the hose and the other on the outer surface thereof, the hose having a recess in its outer surface, a conducting-plate located in said recess and connected with that conductor which has its ends exposed on the inner surface of the hose, a removable insulating-cap covering said recess, and means for connecting adjacent hose-sections and the conductors thereof.

8. The combination of a coupling having its metal parts separated and insulated from the inner surface of the hose, with an electric circuit, one leg or wire of which passes inside the hose at the coupling, being thus insulated from the other leg or wire which passes through or over the metal parts of the coupling.

9. The combination of a coupling having its metallic parts insulated from the inner surface of the hose by the hose itself, the shunting ends of which are turned back over parts of the coupling, clamped in that position and pressed firmly together by the other parts thereof, with any electric circuit for signaling, including conductors, connections, circuit-breakers, transmitters and receivers, so arranged that one leg or wire passes through or is connected inside of the hose at the coupling, and is insulated by the hose and its shunting ends from the other leg or wire, which passes outside the coupling, through or over the metallic parts.

10. The combination with hose-sections having their adjacent ends turned over or bent, forming flanges, the ends or bands of which are adapted to abut against each other, of inner coupling-sections each projecting into the space between the body of a hose-section and the flange thereof, clamping-sections each surrounding one of the inner sections and arranged to clamp the hose-flange against it, and a nut to turn on one of the outer sections adapted for a screw connection with the other clamping-section, so arranged that when the nut is screwed up on the other clamping-section, the flanges will be pressed together by the inner coupling-sections and locked by the nut, and embedded in each section of hose two wires out of contact with each other, the end of one connected by contact-plugs or otherwise with the inner coupling-section, and connecting through the outer sections of the coupling with a similar plate or wire in another section of hose or stand-pipe or tank, the end of the other wire entering the tube of the hose inside the coupling, and terminating in a contact-plate which may be connected by a suitable device with a similar plate and wire in another hose-section or stand-pipe or tank.

699,456. ART OF TREATING ORES. ARTHUR H. DOW and JAMES W. DAVIS, Boston, Mass., assignors to Chemical and Electrical Ore Reducing Company, of West Virginia. Filed Feb. 12, 1908. Serial No. 94,888. (No specimen.)

Claim.—The process of producing matte directly from ores which consists in charging the ore into a suitable chamber, subjecting it there first to a comparatively low heat whereby it is heated to drive off as far as possible its volatile constituents, and next to a high or smelting heat, discharging the ore as it is smelted into a matte-chamber below and subjecting the molten mass as it accumulates in said matte-chamber to an

intense heat, whereby it is purified and concentrated, supplying a gas rich in oxygen both to the chamber in which the ore is heated and smelted, and, at the time the metal begins to flow, to the matte-chamber, and maintaining a downward draft through both chambers, substantially as and for the purposes hereinafter set forth.

699,457. APPARATUS FOR TREATING ORES. ARTHUR H. DOW and JAMES W. DAVIS, Boston, Mass., assignors to Chemical and Electrical Ore Reducing Company, of West Virginia. Filed Feb. 12, 1908. Serial No. 94,888. (No model.)

Claim.—1. Apparatus for treating ores, comprising a reduction-chamber; a matte-chamber below and communicating with the reduction-

chamber; means for creating and maintaining a downward draft through the reduction and then through the matte-chamber; charcoal-chambers communicating with the upper part of said reduction-chamber; gas-jets located in both the reduction-chamber and the matte-chamber; and a source of supply of gas under pressure having controllable communication with said gas-jets, substantially as and for the purposes hereinafter set forth.

2. A furnace for the treatment of ores having a reduction-chamber; charcoal-chambers communicating with the upper portion of said reduction-chamber; a matte-chamber below the reduction-chamber; a molten-metal receiver in said matte-chamber; means for creating and maintaining a downward draft in said furnace, downward through the reduction-chamber thence down, into and through the matte-chamber and around the receiver therein, and thence out from the furnace, and means for introducing gas into both the reduction-chamber and the matte-chamber, substantially as and for the purposes hereinafter set forth.

699,458. METHOD OF COVERING ELECTRIC CONDUCTORS AND MAKING CABLES. ROBERT W. DOWSE, Northampton, England. Filed Feb. 1, 1908. Serial No. 92,888. (No model.)

Claim.—The herein-described method of making an electric cable formed of a plurality of wires or strands or wires and strands embedded or incased in celluloid, xylolite or similar material by forcing the material under pressure through a die and around and between the wires or strands passing through the die and at same time imparting a twist to the cable thus formed so as, at a single operation, to form a cable wherein the individual wires and strands are insulated from each other and are twisted about the central wire or strand, as described.

699,459. APPARATUS FOR INSULATING OR COVERING STRANDS AND FORMING SAME INTO CABLES. ROBERT W. DOWSE, Northampton, England. Filed Feb. 1, 1908. Serial No. 92,887. (No model.)

Claim.—1. A die for the manufacture of electric cables by extrusion of plastic insulating material around and between a central conductive strand and a surrounding circle of strands, the said die comprising a cylindrical chamber closed at one end and having an extrusion-nozzle of larger internal diameter than that of the chamber at the other end, said chamber communicating through lateral inlet-ports with the pressure-cylinder for supplying the plastic material, a central tubular guide-rod extending into the extrusion-nozzle and a group of similar guide-needles spaced in a circle around and converging toward the central guide-rod, all of said guide-needles being of conically-tapered form, and leading into the die-chamber through the closed end thereof, to a point beyond the lateral inlet-ports and terminating just before the commencement of the extrusion-nozzle, substantially as specified.

2. A die for the manufacture of electric cables by extrusion of plastic insulating material around and between a central conductive strand and

a surrounding circle of strands, the said die comprising a cylindrical chamber closed at one end and having an extrusion-nozzle of lesser internal diameter than that of the chamber at the other end, said chamber communicating through lateral inlet-orifices of graduated diameter with a circumferential channel in connection with the pump-cylinder for supplying the plastic material, a central tubular guide-mandrel coaxial with the extrusion-nozzle and a group of similar guide-mandrels spaced in a circle around and converging toward the central guide-mandrel, all of said guide-mandrels being of externally-tapered form, and leading into the die-chamber through the closed end thereof, to a point beyond the lateral inlet-orifices and terminating just before the commencement of the extrusion-nozzle, substantially as specified.

699,460. DUST-COLLECTOR. BENJ. R. DRAVER, Winchester, Ind.
Filed Mar. 23, 1900. Serial No. 19,466. (No model.)

Claim.—1. In a dust-collector, the combination with a casing having a series of cells and dust-receiving and clean-air chambers in communication through said cells, dust-collecting media within said cells, and a cut-off device traveling over said cells and operating to cut off therefrom, in succession, the dust-laden air, which cut-off device is in communication with the supply of clean air, whereby a reverse current of clean air will be forced through the dust-collecting media of said cells while the dust-laden draft is cut off from the particular cells containing the same.

2. In a dust-collector, the combination with a casing having a series of cells and dust-receiving and clean-air chambers in communication through said cells, dust-collecting media supported in said cells, a cut-off device mounted to travel back and forth over said series of cells and operating to cut off the dust-laden draft through the said cells and their collecting media, in succession, which cut-off device is in communication with the supply of clean air and delivers the same to said collecting media while the dust-laden air is cut off from the particular cells containing the same, and means for jarring the collecting media while the dust-laden air is cut off from the same, substantially as described.

3. In a dust-collector, the combination with a casing having dust-receiving and clean-air chambers, and a series of cells affording communication between said chambers, dust-collecting tubes suspended in said cells, a section-fan applied to produce the dust-laden draft through said tubes and cells, a cut-off gate mounted to travel over the delivery end of said cells and operating to cut off the dust-laden draft from said cells, in succession, which cut-off gate is in communication with the supply of clean air, and delivers the same to said cells and the tubes therein contained, while the dust-laden draft is cut off therefrom, and means for jarring said tubes while the dust-laden draft is cut off from the particular cells containing the same, substantially as described.

4. In a dust-collector, the combination with the casing having dust-receiving and clean-air chambers in communication only through the intermediary of a series of stationary cells and dust-collecting tubes suspended in said cells, of means for forcing the dust-laden air through said tubes and cells, a cut-off gate mounted to travel over the delivery end of said cells, for cutting off the dust-laden draft from the tubes and cells

which cut-off gate is provided with an opening in communication with the external atmosphere by an extensible tube, for supplying clean air to said cells and tubes when the dust-laden draft is cut off by said gate, substantially as described.

5. The combination with the middlings-purifier having the dust-chamber 3, of the dust-collector casing 5 applied to said purifier and constructed to afford the clean-air chamber 4, the interposed series of cells 6 and collecting-tubes 7, through which the said chambers 3 and 4 communicate with each other, the section-fan applied to produce the dust-laden draft through said cells and tubes, a cut-off gate mounted to travel back and forth over the delivery ends of said tubes, which cut-off gate is provided with an opening connected by an extensible tube with the external atmosphere for delivering clean air to said cells and tubes when the dust-laden draft is cut off, and shaking devices operated by said cut-off gate for jarring the said tubes within said cells when the dust-laden draft is cut off, all substantially as and for the purposes set forth.

699,461. CLUTCH. BENJ. DREWSEN, Monterey, Mexico. Filed Mar. 20, 1901. Serial No. 59,478. (No model.)

Claim.—The combination of a rotary shaft, a driving member arranged thereon and comprising an outer part or rim, a hub fitted loosely on the shaft and spokes connecting the outer part and hub together, a lever fulcrumed on the outer part of the driving member and carried thereby, the lever having a weighted arm extending between the spokes and normally lying adjacent to the hub, a spring attached to the hub and to the said weighted arm of the lever to hold the arm forward, a clutch member carried by the other arm of the lever, and a disk fastened to the shaft and adapted to be engaged on its periphery by the said clutch member, whereby to fix the driving member to the shaft.

699,462. NESTABLE PAIR. FRANK C. G. HILL, Buffalo, N. Y.
Filed May 23, 1901. Serial No. 61,432. (No model.)

Claim.—1. A pair comprising a plurality of vessels; one of which has a hinging portion provided with oppositely-disposed perforations, and the other oppositely-disposed spring-tensioned bolts adapted to lock in the perforations in said hinging portion and to be pressed inwardly by the operator to release it therefrom.

2. In a vessel comprising a plurality of parts, one having a perforation and another having slots and an opening between the slots, a locking-bolt adapted to seat in the perforation of the first-mentioned part and projecting through the opening, a spring tensioning the bolt and an enclosing part for said spring having ears fitting through the slots, substantially as set forth.

3. In combination, a plurality of vessels adapted to be fastened in superimposed position and having oppositely-disposed perforations in the

upper portions of its ends and each vessel with the exception of the bottom vessel having oppositely-disposed spring-tensioned locking-bolts in the lower portion of its ends adapted to spring into the depressions of the adjacent vessel, substantially as set forth.

699,463. MACHINE FOR MAKING BASKET-COVERS. CARL BROSINA, St. Joseph, Mich., assignor to Abel W. Wells and John Higman, St. Joseph, Mich. Filed Oct. 31, 1901. Serial No. 59,648. (No model.)

Claim.—1. The combination of a work form or holder, means for imparting a step-by-step movement thereto, and a stapling device consisting with the work-holder, said work-holder comprising a circular body or form, parallel ribs on the top thereof, and a clamp or clamps working against the periphery of the form.

2. The combination of a work form or holder, means for imparting a step-by-step movement thereto, a stapling device consisting with the work-holder, said work-holder comprising a circular body or form, parallel ribs on the top thereof, a clamp or clamps working against the periphery of the form, the parallel ribs being separated by an open space running across them, and a notch located at said space, for the purpose specified.

3. The combination of a work form or holder, means for imparting a step-by-step movement thereto, a stapling device consisting with the work-holder, the work-holder comprising a body or form, a clamp working against the body, a lever connected to the clamp, a tapering member acting on the lever, for the purpose specified, and means for actuating the said tapering member.

4. The combination with a frame, of a base carried thereon, a shaft arranged to turn thereon, a means for driving the shaft, a work-form carried by the shaft, a clamp working with and carried by the form, a lever connected with the clamp, a tapered member slidable on the base to engage and throw the lever, and means for actuating the said tapered member.

5. The combination of a rotary shaft, a work-form carried thereby, a ratchet-wheel fixed to the shaft, a pawl, means actuating the pawl to impart a step-by-step movement to the ratchet-wheel, and a friction device consisting with the ratchet-wheel and its connected part to prevent idle movement thereof, said friction device comprising a block, a cammed rock-shaft whereon it is carried, and a spring pressing the rock-shaft.

6. The combination with two work forms or holders, of a means movable into engagement with one or the other to impart a step-by-step movement thereto, and a stapling device in connection with said means to be shifted in unison therewith.

7. The combination of two work forms or holders, a reciprocal device adapted to impart a step-by-step rotary movement to one or the other of the work-holders, a lever connected with said reciprocal device to

throw it to the adjustment desired, and a stapling device connected with the lever, to be shifted upon the movement thereof.

8. The combination of two work forms or holders operative with a step-by-step rotary movement, a ratchet-wheel in connection with each, a reciprocally-driven member, a pawl pivotally carried on said member, and means for throwing the pawl into engagement with one ratchet-wheel or the other.

9. The combination of two work forms or holders operative with a step-by-step rotary movement, a ratchet-wheel in connection with each, a reciprocally-driven member, a pawl pivotally carried on said member, means for throwing the pawl into engagement with one ratchet-wheel or the other, and a stapling device connected with said means for throwing the pawl, whereby to be adjusted in unison with the pawl.

10. The combination of two work forms or holders operative with a step-by-step rotary movement, a ratchet-wheel in connection with each, a reciprocally-driven member, a pawl pivotally carried on said member, a lever connected with the pawl to throw it into engagement with one ratchet-wheel or the other, a member mounted to turn and forming the fulcrum of the lever, and a stapling device connected with said turning member.

11. The combination with two work forms or holders, of a means movable into engagement with one or the other to impart a step-by-step movement thereto, a stapling device in connection with said means, to be adjusted in unison therewith, an operating-lever for the said means, a gearing for driving the said means, said gearing including a clutch, and a connection between the clutch and operating-lever.

12. The combination of two work forms or holders, a means for imparting a step-by-step movement to either of the work-holders, a hollow column mounted to turn, a lever connected thereto and to said means for imparting movement to the work-holders, a stapling device carried by the column, an operating rod running through the column to actuate the stapling device, a drive-shaft, a clutch consisting therewith, a connection between the lever and the clutch to actuate the latter, and devices actuated from the drive-shaft and controlled by the clutch, said devices respectively driving the means for imparting movement to the work-holders and the said operating-rod.

13. The combination of two work-form holders, a means movable into engagement with either one or the other to impart a step-by-step movement thereto, and a stapling device capable of working with either one of the work-holders.

699,464. PEN. FREDERICK J. W. FISHER, Rockaway, N. Y., assignor to Eagle Pen Company, New York, N. Y. Filed Mar. 3, 1902. Serial No. 59,494. (No model.)

Claim.—As a new manufacture a steel pen having the longitudinal central slit reduced surface *a*, extending from the piercing along and on both sides of the central slit leading from the piercing to the point, substantially as and for the purposes hereinafter set forth.

699,465. ANIMAL-TRAP. JAMES M. BRAMMER, El Paso, Pa. Filed Sept. 7, 1901. Serial No. 74,677. (No model.)

Claim.—1. In a device of the kind described, the combination of a base-bar having its ends terminating in spring-arms, posts arranged on the said base-bar and adapted to pass through apertures formed in the said arms, jaws pivotally held on the said posts, a cross-bar arranged to operate upon the said jaws, and means for holding the said jaws in an open position, substantially as shown and described.

2. In a device of the kind described, the combination of a base-bar having its ends terminating in spring-arms, posts arranged on the said base-bar, jaws pivotally held in the said posts, a cross-bar having perforations formed in the ends thereof and adapted to slide upon the said posts and operate through the medium of the spring-arms, to close the said jaws, and means for locking the said jaws in an open or closed position, substantially as shown and described.

3. In a device of the kind described, the combination of a base having spring-arms formed thereon, posts held on the said base-bar, jaws provided with spurs pivoted in the posts, a cross-bar having spurs and ar-

arranged to operate to close the said jaws through the medium of the said spring-arms, and a trigger arranged for engagement with the said cross-bar for holding the trap in an open or set position, substantially as shown and described.

4. In a device of the kind described, the combination of a base-bar, having spring-arms formed thereon, posts arranged on the said base-bar and adapted to pass through apertures formed in the ends of the said spring-arms, jaws pivoted in the said posts, a cross-bar having its ends provided with apertures through which the said posts are adapted to pass when the said bar is pressed down against the tension of the spring-arms, and adapted to operate upon the jaws when the springs are released, a trigger pivotally held on a transverse bar arranged on the base and adapted for locking the said cross-bar against the tension of the spring-arms, the said springs being adapted to rest against the upper ends of the posts when released from engagement with the trigger, thereby locking the jaws in a closed position, the said jaws and bar having spurs arranged thereon, substantially as shown and described.

699,466. ROLLER-BEARING. CLEVELAND C. HUBBARD, Indianapolis, Ind. Filed Sept. 12, 1901. Serial No. 78,678. (No model.)

Claim.—In combination with the hub and axle, having a shoulder T, a shell Q having a central portion with thickened wall, an integral annular flange E², in the bore of said shell, designed to contact with said shoulder, the shells E¹ reversely arranged on the opposite sides of the central thickened portion of shell Q, and abutting against the same and the rings L², rollers journaled in said rings, and means for holding the parts in place, as set forth.

699,467. CARDING-MACHINE ATTACHMENT. GEORGE D. B. GRADAR, Providence, R. I. Filed Dec. 12, 1901. Serial No. 93,900. (No model.)

Claim.—1. A carding-machine attachment, comprising revoluble guards for closing the spaces at the ends of the cylinder, workbars and cleaners, as set forth.

2. A carding-machine attachment, comprising a pair of revoluble guards for closing the spaces at the ends of the cylinder, the last worker and the finny, as set forth.

3. A carding-machine attachment, comprising a pair of revoluble guards for closing the spaces at the ends of the cylinder, the last worker and the finny, and means for rotating the said guards from the last worker, as set forth.

4. A carding-machine attachment, comprising revoluble guards for closing the spaces at the ends of the cylinder, workbars and cleaners, the said guards being in the form of disks secured to the shafts of the cleaners, as set forth.

699,468. SIDEWALK TRAP-DOOR. PETER H. JACOBSON, San Francisco, Cal. Filed Dec. 28, 1901. Serial No. 94,900. (No model.)

Claim.—1. Sidewalk-door, substantially horizontally disposed, a frame extending on two sides and across the front of the hatchway-opening to the sides of which doors are hinged, said doors closable together, and a bearer rigidly secured to the underlapping door and projecting beyond the free edge of the same and capable of extending across the rear open ends of the said frame, and a support for the outer or free end of said right bar.

2. Sidewalk-door closable to meet together, a framework set in the sidewalk to the sides of which the longitudinal edges of the doors are hinged, said framework extending across the outer or front side of the hatchway and being open at the inner or rear ends, a bearer bolted immovably to the underlapping leaf of the doors and projecting beyond the edge so as to extend across the full width of the hatchway and supports upon which the ends of the bearer rest when the doors are closed.

3. The combination with a sidewalk hatchway-opening of a frame set therein and surrounding three sides of the opening and anchored fixed to said frame extending downward within the hatchway and fixed to the sides thereof whereby the frame is prevented from being loosened, doors hinged to the sides of the frame and closable together, a bearer carried by one of said doors having a length sufficient to extend across the rear open space between the ends of the frame and steps at the ends upon which the bearer rests.

4. A hatchway-opening having a frame surrounding three sides and open at the rear, doors hinged to the sides of the frame closable together, a combined trough and bearer extending beneath the hinged edges of the doors and across the front forming a support for the door when closed, and a combined trough and bearer which is bolted along the free edge of the underlapping leaf of the doors; in combination with flanges upturned around the rear edges of the doors where they meet the building-front, said flanges preventing the entrance of water and obviating a gutter at this point.

5. A hatchway having a framework extending on two sides and the front and interconnected at the rear, doors hinged to the sides of said framework closable together, said doors having their inner ends formed with an upturned flange, a bar or bearer bolted across the inner end of the underlapping door extending beyond the outer edge, a support upon the opposite side of the hatchway upon which said bar rests when the door is closed and upon which bearer the inner end of the other leaf of the door rests when closed.

699,469. ELBOWED COUPLING. TUDOR C. JAMES, Milwaukee, Wis. Filed Aug. 22, 1901. Serial No. 78,698. (No model.)

Claim.—1. An electric coupling, comprising two sections, each section being divided into two chambers or compartments, contact devices arranged in the chambers, and contact devices carried by each section for closing a circuit when the sections of the coupling are separated, substantially as specified.

2. An electric coupling, comprising two sections, each section being divided into two chambers, a block arranged in the outer end of one of said chambers, a contact-screw passing through a central opening in said block and adapted for connection with a line-wire, a metallic sleeve with which the inner end of said screw-contact engages, another block arranged in said chamber, a contact-screw extending through said other block and engaging with said sleeve, a sleeve in other chamber engaging the projected end of said other block, a block in the other chamber, a plate on the inner end of said block and in connection with the line-wire, a spring attached to said block, and a cap secured to the other end of said spring and adapted for engaging with the last-named contact-screw of the other section, substantially as specified.

3. An electric coupling, comprising two sections, each section consisting of two tubes of insulating material, the two tubes being secured together, a metallic cap at the outer end of the section, socket-sections extended from said cap into the tubes, a block of insulating material in the socket in one of the tubes, a contact screw or bar passing longitudinally through said block and having connection with a line-wire, a metallic sleeve with which said screw or bar engages, another block arranged in said tube, a long contact screw or bar extended through said other block and engaging with the sleeve, the said long contact screw or bar being provided with a head, a spring arranged in a tube of the other section of the coupling for engaging said last-named screw or bar, a tubular block in the other tube of the section, a cap on the inner end of said block, a spring connected at one end to the cap, and a plate connected to the other end of said spring, substantially as specified.

4. In an electric coupling, a section having circuit-carrying device therein, and a closing-plate for the rear end of a car, the said plate consisting of two tubular portions of insulating material secured together, a cap at one end of said tubes, a sleeve or socket portion extended from said cap through one of the tubes, a spring arranged in said socket portion, a block arranged in the other of the tubes, and a contact-bar extended through said block but not engaging with the cap, substantially as specified.

699,470. COMBINED COMBING AND SHEARING MACHINE.
SAMUEL W. KAPLAN, Hartford, Conn. Filed June 2, 1901. Serial No. 68,742. (No model.)

Claim.—1. The combination with a main frame having a slotted bottom, of an endless feed device moving in the said slot, the combing-cylinders arranged in the main frame above the feed device, the cleaning-cylinders arranged above the combing-cylinders, a shearing device arranged adjacent to one end of the feed device, and means for simultaneously operating the feed device, combing and cleaning cylinders and shearing device, substantially as described.

2. In a combined combing and shearing machine, the combination of a framing, a floor arranged therein, a shearing device arranged above the said floor, combing-cylinders journaled in the said framing and cleaning-cylinders journaled above each combing-cylinder, and means for revolving the cylinders and operating the shearing device, substantially as shown and described.

3. In a combined combing and shearing machine, the combination of a frame, a floor provided with slots held within the frame, feed-belts arranged to operate in the said slots, combing and cleaning cylinders journaled in said frame, a reciprocating cutter-bar adjustably held in the said frame, and means for operating the said cylinders and cutter-bar, substantially as shown and described.

4. In a combined combing and shearing machine, the combination of a frame having a slotted floor arranged therein, feed-belts adapted to travel in the said slots, combing-cylinders journaled in the said frame, cleaner-cylinders journaled above each combing-cylinder, and guards arranged between the said flooring and combing-cylinders, substantially as shown and described.

5. In a machine of the kind described, the combination of a frame, a floor held therein and provided with slots, feed-chains adapted to operate in the slots, combing-cylinders mounted in the said frame, cleaner-cylinders mounted above the said combing-cylinders, a cutter held within the framing, a drive-shaft journaled in the said frame and carrying a cam-disk, a lever pivoted at one end to the side of the frame and having its opposite end provided with antifriction-rollers for engagement with the said disk, and a plunger connecting the said lever and cutter-bar, substantially as shown and described.

6. In a machine of the kind described, the combination of a frame having brackets held to the inner sides thereof, plates carrying cutter-bars adapted to operate in the brackets, levers journaled upon the sides of the frame, plunger connecting one end of the said levers to the plates, segmental racks formed upon the opposite ends of the levers, a shaft provided with pinions journaled in the front of the frame, the said pinions being held in engagement with the racks, and a crank for operating the said shaft, substantially as shown and described.

7. The combination with a main frame, of a series of horizontally-disposed combing-cylinders journaled therein, cleaning-cylinders journaled above each of the said combing-cylinders and operating in a reverse direction to its respective combing-cylinder, a shearing device arranged in the said frame, and means for feeding the skins to the said combing-cylinders and shearing device, substantially as described.

8. The combination of a main frame having a slotted bottom arranged therein, an endless feed device adapted to operate in the said slot of the bottom, combing-cylinders arranged above the said feeding device, cleaning-cylinders arranged for engagement with the said combing-cylinders, a shearing device arranged adjacent to one end of the feeding device and means for removing the sheared material from the cylinders and shearing device, substantially as shown and described.

9. In a combined combing and shearing machine, the combination of a frame, shafts carrying combing-cylinders journaled therein, and having pulleys fixedly held upon one end thereof, shafts carrying cleaner-cylinders journaled above the said combing-cylinders and having pulleys upon the ends thereof and arranged upon the opposite side of the machine to the pulleys of the combing-cylinders, and belts arranged to travel over and under the said pulleys for revolving the combing and cleaner cylinders in opposite directions, substantially as shown and described.

10. In a machine of the kind described, the combination of a frame having a flooring arranged therein, guide-brackets having dovetailed grooves held within the said frame, plates adapted to travel in the said grooves, a cutter-bar connected to the said plates, and means for adjusting the said plates and cutter-bar and reciprocating the cutter-bar, substantially as shown and described.

11. In a machine of the kind described, the combination of a frame a series of combing and cleaner cylinders held in the said frame, a cutter-bar adjustably held within the frame, and heads connected with a section-bar held above the said cylinders and cutter-bar for removing the cut material from the machine, substantially as shown and described.

699,471. APPARATUS FOR FEEDING AND TEMPERING FOUNDRY-SAND.
ALFRED M. ASHLEY, Pittsburgh, Pa. Filed Jan. 24, 1902.
Serial No. 91,117. (No model.)

Claim.—1. In a device for feeding and tempering foundry-sand, the combination of a receptacle or hopper, a table, and rotatable mechanism above said table and under said hopper adapted to be lowered and raised with the table to receive the material from the hopper and discharge the same therefrom.

2. In a device for feeding and tempering foundry-sand, the combination of a receptacle or hopper, a table, and a rotatable feed-wheel above said table having receptacles therein passing under said hopper

adapted to be lowered and raised with said table to receive the material from the hopper and discharge the same therefrom.

2. In a device for feeding and tempering foundry-sand, &c., the combination of a receptacle or hopper, a feed-wheel having receptacles therein passing under said hopper to receive the material therefrom, and means for permitting said feed-wheel and table to be lowered and raised to discharge the material from the feed-wheel.

4. In a device for feeding and tempering foundry-sand, &c., the combination of a receptacle or hopper, a table, a feed-wheel above said table having receptacles therein passing under said hopper to receive the material therefrom, and means for rotating said feed-wheel and for lowering and raising the same and table to discharge the material from the feed-wheel.

5. In a device for feeding and tempering foundry-sand, &c., the combination of a receptacle or hopper, a feed-wheel having receptacles therein under said hopper adapted to receive the material from said hopper and be rotated to discharge the material therefrom, and a weighted table under said feed-wheel adapted to be lowered and raised for engaging and disengaging with the rotating mechanism.

6. In a device for feeding and tempering foundry-sand, &c., the combination of a receptacle or hopper, a feed-wheel having receptacles therein under said hopper to receive the material therefrom and adapted to be lowered and raised, a shaft passing loosely through said table and connected to the feed-wheel, said shaft having a clutch member thereon, and a continuously-moving shaft or drive having a clutch member thereon adapted to engage with the clutch member on the first-named shaft to rotate the feed-wheel when it is lowered with the table to discharge the material from the receptacles in the feed-wheel.

7. In a device for feeding and tempering foundry-sand, &c., the combination of a receptacle or hopper, a table, a horizontal feed-wheel above said table having receptacles therein passing under said hopper to receive the material therefrom, and means for permitting said feed-wheel and table to be lowered and raised to discharge the material from the feed-wheel and receive the same therein.

8. In a device for feeding and tempering foundry-sand, &c., the combination of a receptacle or hopper, a table, a horizontal feed-wheel above said table having receptacles therein passing under said hopper to receive the material therefrom, and means for rotating said feed-wheel and for lowering and raising the same and table to discharge the material from the feed-wheel and receive the same therein.

9. In a device for feeding and tempering foundry-sand, &c., the combination of a receptacle or hopper, a horizontal feed-wheel having receptacles therein under said hopper adapted to receive the material from said hopper and be rotated to discharge the material therefrom, and a weighted table under said feed-wheel adapted to be lowered and raised for engaging and disengaging with the rotating mechanism.

10. In a device for feeding and tempering foundry-sand, &c., the combination of a receptacle or hopper, a horizontal feed-wheel having receptacles therein under said hopper to receive the material therefrom and adapted to be lowered and raised, a vertical shaft passing loosely through said table and connected to said feed-wheel, said shaft having a clutch member thereon, and a continuously-moving upright shaft or drive having a clutch member thereon adapted to engage with the clutch member on the first-named shaft to rotate the feed-wheel when it is lowered with the table to discharge the material therefrom.

11. In a device for feeding and tempering foundry-sand, &c., the combination of a receptacle or hopper, rotating mechanism under said hopper adapted to be automatically lowered and raised to receive the material and discharge the same therefrom, and means for supplying water to said material.

12. In a device for feeding and tempering foundry-sand, &c., the combination of a receptacle or hopper, a feed-wheel having receptacles therein under said hopper to receive the material therefrom, means for rotating said feed-wheel and for lowering and raising the same to discharge the material therefrom and receive the same therein, and means for supplying water to said material.

13. In a device for feeding and tempering foundry-sand, &c., the combination of a receptacle or hopper, a feed-wheel having receptacles therein under said hopper to receive the material therefrom, means for rotating said feed-wheel and for lowering and raising the same to discharge the material therefrom and receive the same therein, and a pipe connected to a water source and adapted to supply water to the material.

14. In a device for feeding and tempering foundry-sand, &c., the combination of a receptacle or hopper, a table, a feed-wheel above said table having receptacles therein passing under said hopper to receive the material therefrom, means for rotating said feed-wheel and for lowering and raising the same and table to discharge the material from the feed-wheel and receive the same therein, a pipe connected to a water source and provided with a valve therein, and connection between said table and valve for opening and closing said valve to supply water to the material.

15. In a device for feeding and tempering foundry-sand, &c., the combination of a receptacle or hopper, a table, a feed-wheel above said table having receptacles therein passing under said hopper to receive the material therefrom, means for rotating said feed-wheel and for lowering and raising the same and table to discharge the material and receive the same therein, a pipe connected to a water source and provided with a valve therein, a lever on said valve, a rod connected to said lever, and a bar connected to said table and rod for opening and closing said valve to supply water to the material.

699,479. **STURDY.** WILLIAM E. AUBREY and WALTER CLIFTON, Chicago, Ill. Filed June 6, 1901. Serial No. 62,357. (No model.)

Claim.—1. A stirrup, comprising a metal body circular in its major portion, concave-convex in cross-section throughout said circular portion, and provided above the circular portion with two members, that are parallel and flat on inner surfaces thereof, a changeably-positioned carrier-bolt held between said flat surfaces, and means to change the position of said carrier-bolt laterally and vertically.

2. A stirrup, comprising a metal body circular in its major portion, convex on the inner face of said circular portion, and provided above the circular portion with two limbs that are flat on their inner surfaces, a carrier-bolt adapted for engagement with either of a group of spaced holes in each of said flat-faced limbs, and thus raise or lower the tread portion of the stirrup with regard to said carrier-bolt.

3. A stirrup, comprising a metal body convex on the inner surface, circular in its major portion, having two straight members above the circular portion, a plurality of orifices in said straight members, disposed oppositely in pairs, a carrier-bolt having a head on one end and a screw-end on the opposite end, said bolt being adapted to engage with any pair of the orifices so as to dispose said bolt above, below or at either side of a central pair of the orifices, a cylindrical core-block mounted on the bolt-body, and a sleeve loosely supported upon the core-block.

699,478. **TYPE-WRITER.** THOMAS E. AUBREY, Columbia, Tex. Filed Feb. 3, 1902. Serial No. 14,081. (No model.)

Claim.—1. In a type-writer, the combination of a type-bar bearing a lower-case letter and provided with a pivoted key-bar, a type-bar bearing an upper-case letter and provided with a key-bar, a slidingly-mounted key bearing a rotatable shaft bearing a pinion and a foot normally engaging one of said key-bars, and means for rotating said pinion to bring said foot into engagement with the other of said key-bars, substantially as described.

2. In a type-writer, a pair of pivoted key-bars, a slidingly-mounted key bearing a rotatable shaft having a foot engaging one of said key-bars, a sliding plate carried by said key, and means operated by the slid-

ing of said plate to rotate said shaft to bring said foot into engagement with the other of said key-bars, substantially as described.

3. In a type-writer, a pair of pivoted key-bars, a slidingly-mounted key bearing a rotatable shaft having a foot engaging one of said key-bars, a sliding plate carried by the head of said key, means operated by the sliding of said plate to rotate said shaft to bring said foot into engagement with the other of said key-bars, and a spring arranged to operate said sliding plate to restore it to its initial position, substantially as described.

4. In a type-writer, the combination of a pair of pivoted key-bars, a slidingly-mounted key having a rotatable shaft bearing a foot normally engaging one of said key-bars, a pinion on said shaft, a sliding plate bearing a rack-bar meshing with said pinion, and a spring arranged to operate said sliding plate to restore it to its initial position, substantially as described.

699,474. **BRUSH.** GEORGE H. BRADLEY, Canton, Mass., assignor to Bradley Brush Company, Canton, Mass. Filed Jan. 21, 1902. Serial No. 70,577. (No model.)

Claim.—1. In a rotary brush, the combination of an apertured core, perforated portions having a greater diameter than and surrounding said core, an annular space being left between said perforated parts and said core, bristles passing through said perforated parts and into said annular space, annular plates secured upon each side of said core, and a cementing composition filling said annular space.

2. In a rotary brush, the combination of an apertured core, a perforated band of greater diameter than said core enclosing said core, a perforated annular casing fitted over said band provided with overlapping edges, annular plates secured upon each side of said core, over which are rolled said overlapping edges, bristles passing through said band and casing, and a cementing composition filling the space between said band and core.

699,475. **BRICK PLANT.** BYRON E. ROBERTS, Waterloo, Canada. Filed Nov. 22, 1901. Serial No. 14,074. (No model.)

Claim.—1. A brick plant having a loading-platform provided with elevated supports adapted to uphold the pallets on which the green bricks are stacked, whereby the loaded pallets can be picked up by the brick-truck, a back-shed having parallel elevated supports for the loaded brick-pallets, extending throughout, an unloading-platform provided with elevated supports to receive and uphold the loaded brick-pallets from said shed, and passage-ways or floors for the brick-trucks from the loading-platform to and through the shed to said unloading-platform, substantially as described.

2. A brick-making plant or system having brick-pallets, a loading-platform arranged adjacent to the green-brick-forming machinery, and provided at its brick-receiving edge with a fixed elevated support for the loaded brick-pallets comprising two parallel rigid bars or beams resting on the platform, a back-shed having elevated supports therein to receive the loaded pallets, and a passage-way for the trucks from said platform into said shed, substantially as described.

3. A brick plant having a back-shed having an inlet and an outlet, and a multiplicity of pallet-supporting beams arranged edgewise along the floor of said shed between said inlet and outlet, said beams arranged in parallel pairs, said pairs being closely arranged transversely with intervening track-spaces between and parallel with said pairs of beams for the passage of the wheels of a hand-truck movable along above any pair of beams with its wheels in the track-spaces along opposite sides of said pairs, transverse track-passages at the inlet and outlet of said shed communicating with said track-spaces, whereby the loaded trucks can pass in at the inlet along any pair or pairs of beams to deposit the loaded pal-

lets on said beams, and whereby trucks can pass in at the outlet along any pair or pairs of beams to pick up and remove the loaded pallets from the shed, substantially as described.

4. A brick-making plant having a back-shed having elevated supports extending throughout from the inlet to the outlet thereof, and tracks arranged between and parallel with the supports, the supports and tracks arranged so that each track serves for two supports, substantially as described, and transverse track-passages arranged at the ends of said tracks and supports and communicating with each track, whereby loaded trucks can move through the inlet and along any track and support, and whereby trucks for removing the bricks can move in and out of the outlet and along any track and support.

5. A brick-making plant having a back-shed having series of elongated parallel supporting-bars closely arranged on and projected above the floor thereof and adapted to transversely receive loaded brick-pallets and uphold the same from said floor, said bars arranged in parallel pairs with spaces between the pairs for the passage of the truck-wheels, whereby the trucks can pass in and out at one end of the shed in depositing the loaded pallets on said bars, and can pass in and out at another end of the shed in picking up and removing said loaded pallets, substantially as described.

6. A brick-making plant having a back-shed having closely arranged series of supporting-bars extending throughout between the inlet and outlet thereof, said bars arranged in pairs for the purpose specified, and a parallel track-wheel track arranged between each pair of said bars, as and for the purposes mentioned.

7. A brick-making plant having a back-shed having series of pairs of supporting-bars arranged on and projecting above the floor thereof to receive and uphold the loaded pallets of brick, said bars arranged with intervening spaces for the truck-wheels, a movable unloading-platform arranged in a kiln and provided with an elevated unloading-table to receive the loaded pallets from the trucks, and a passage-way for the trucks from said supporting-bars if said shed to said platform comprising movable track-sections, substantially as described.

8. A brick plant having a platform to receive the loaded brick-trucks, and parallel bars resting on and projecting above the platform and rigidly secured together and provided with projections to enter the platform and hold the support in place, said support adapted to transversely receive loaded brick-pallets from a truck and uphold the same from the platform, as described.

9. In a brick plant, a platform to receive the brick-trucks, and an elevated support on the platform comprising bars resting on the platform and rigidly secured together and provided with projections to enter the platform and hold the support in place, said support adapted to transversely receive loaded brick-pallets from a truck and uphold the same from the platform, as described.

10. In a brick plant, a head-shed having a multiplicity of closely-arranged parallel pallet-supporting beams arranged on the floor thereof, said beams arranged in pairs with track-wheel spaces between the pairs and parallel therewith and a single track arranged in each space parallel with the beams, as and for the purpose stated, the arrangement being such that a head-truck can move longitudinally along, above a pair of beams with its wheels travelling on the tracks outside of said pairs, substantially as described.

699,476. MACHINE FOR WAX-TREATING PARTS OF BOOTS OR SHOES. DA. HARRY E. BINKLEY and CHARLES FRANK, Lynn, Mass., assignors to the Xpedite Machine Company, Barwick, Me. Filed Jan. 28, 1900. Serial No. 2,371. (No model.)

Claim.—1. A machine of the character indicated, comprising a work-rubbing member, means to move it for rubbing the work, means for holding malleable wax, where it will be applied to the work-rubbing face of said member and separate means for spreading said wax on said work-rubbing face.

2. A machine of the character indicated, comprising a work-rubbing member, and means to move it for rubbing the work, and means for applying wax to the work-rubbing face of said member, and means operating transversely to the motion of the work-rubbing member for spreading said wax on said face, substantially as described.

3. A machine of the character indicated, comprising a work-rubbing member, and means to move it for rubbing the work, and means for applying wax to the work-rubbing face of said member, combined with a medium for spreading said wax on the work-rubbing face of said member, and means to be adjustably shifted for changing the state of said medium relatively to said face, substantially as described.

4. A machine of the character indicated comprising a work-rubbing member and means to move it for rubbing the work and means for applying wax to the work-rubbing face of said member combined with a medium and means to move it across the working edge of said rubbing member for spreading said wax on said face, substantially as described.

5. A machine of the character indicated, comprising a work-rubbing member, and means to move it for rubbing the work, and means for applying wax to the work-rubbing face of said member, combined with a medium and means to move it transversely for spreading the wax on said face, substantially as described.

6. A machine of the character indicated, comprising a work-rubbing member, and means to move it for rubbing the work, and means for applying wax to the work-rubbing face of said member combined with a medium, and means to move it for spreading the said wax on said face, and a controller means for regulating the path of movement of said medium, whereby it is caused to move in approximately conformity with the contour of said work-rubbing face, substantially as described.

7. A machine of the character indicated, comprising a work-rubbing member, and means to move it for rubbing the work, and means for applying wax to the said work-rubbing face, combined with a medium and means to move it for spreading the wax on said face, and a cam device for controlling the path of movement thereof, whereby it is caused to

move in a line conformable approximately to the contour of said working face, substantially as described.

8. A machine of the character indicated, comprising a work-rubbing member and means to move it for rubbing the work, and means for applying wax to the work-rubbing face of said member, combined with a medium and means to move it for spreading the wax on said work-rubbing face, and a controller means whereby the movement of said medium is made to conform, approximately, to the cross-sectional contour-line of said work-rubbing face, substantially as described.

9. A machine of the character indicated, comprising a work-rubbing member, means to move it for rubbing the work, means for applying malleable wax to the work-rubbing face of said member, a separate medium in juxtaposition with said face for spreading said wax on said face.

10. A machine of the character indicated, comprising a work-rubbing member and means to move it for rubbing the work, and means for applying wax to the work-rubbing face of said member, combined with a medium in juxtaposition with said work-rubbing face for spreading the wax thereover, and mechanism to be adjustably moved for shifting the pressure of said medium on said working face, substantially as described.

11. A machine of the character indicated, comprising a work-rubbing member and means to move it for rubbing the work, and means for applying wax to the work-rubbing face of said member, combined with a yieldingly-supported medium in juxtaposition with said working face for spreading the wax thereover, substantially as described.

12. A machine of the character indicated, comprising a work-rubbing member and means to move it for rubbing the work, and means for applying wax to the work-rubbing face of said member, combined with a reciprocating medium of yielding material in juxtaposition with said working face for spreading the wax thereover, substantially as described.

13. A machine of the character indicated, comprising a work-rubbing member and means to move it for rubbing the work, and means for applying wax to the work-rubbing face of said member, combined with a reciprocating medium in juxtaposition with said work-rubbing face for spreading the wax thereover, and spring-controlled means for regulating the pressure of said medium on said face, substantially as described.

14. A machine of the character indicated, comprising a work-rubbing member and means to move it for rubbing the work, and means for applying wax to the work-rubbing face of said member, combined with means for spreading the wax on the work-rubbing face of said member, and means for gauging the position of the work to the said work-rubbing face, substantially as described.

15. A machine of the character indicated, comprising, in combination, a work-rubbing member and means to move it for rubbing the work, means for heating said member, means for applying wax to the work-rubbing face of said member, transversely-reciprocating means for spreading the wax on said work-rubbing face, and means for gauging the position of the work relatively to said face, substantially as described.

16. A machine of the character indicated, comprising a work-rubbing member, means to move it for rubbing the work, means for applying malleable wax to the work-rubbing face of said member, means for artificially heating said member and independent means for spreading said wax on said work-rubbing face.

17. A machine of the character indicated, comprising a work-rubbing member, means to move it for rubbing the work, means for applying malleable wax to the work-rubbing face of said member, an independent medium and means to move it for spreading said wax on said work-rubbing face.

18. A machine of the character indicated, comprising a work-rubbing member, means to move it for rubbing the work, means for applying wax to the work-rubbing face of said member, a medium and means to move it in a line running opposite of the line of movement of said work-rubbing face for spreading said wax on said face, substantially as described.

19. A machine of the character indicated comprising a work-rubbing member, means to move it for rubbing the work, means for holding malleable wax, means for melting and applying said wax to the work-rubbing face of said member, an independent medium in juxtaposition with said face, and means to move it for spreading said wax on said face, substantially as described.

20. A machine for the purpose indicated comprising a work-rubbing member, means for applying wax to said member, separate means operating to thereafter spread said wax on the working face of said member and means for moving said member to do its work.

21. A machine for the purpose indicated comprising a work-rubbing member, means for applying wax to said member, separate means for thereafter spreading said wax on the working face of said member, means for heating said member, and means for moving said member to do its work.

22. A machine for the purpose indicated, comprising a work-rub-

ing member, a wax-supply, means for heating said wax, and a medium of yielding material for spreading the wax on said face.

699,477. CONVEYER-BELT ROLLER. WILLIAM E. BEE, ANSON, Ill., assignor to FIRM of Stephens, Adams & Co., consisting of WILLIAM E. BEE, WILLY W. STEPHENS, and FREDERICK S. ADAMS, ANSON, Ill. Filed May 11, 1901. Serial No. 59,599. (No model.)

Claim.—1. In a conveyor for conveyor-belts, in combination, an upwardly-extending bracket apertured from its upper end, a bearing fitting in the aperture and spaced from the side wall thereof, a spindle journaled in the bearing, the bearing having passages leading from the space surrounding the same to the spindle, and a roller fixed upon the outer end of the spindle and extending downwardly over the bracket.

2. In a conveyor for conveyor-belts, in combination, an upwardly and outwardly inclined bracket apertured from its upper end, a bearing fitting in but not filling such aperture, a spindle journaled in the bearing and resting upon the bottom of the aperture, a roller fixed upon the outer end of the spindle and extending downwardly over the bracket, and a scraper integral with the bearing for removing from the spindle and returning to the bearing the oil carried out of the bearing.

699,478. WALL-PAPER-DISPLAY RACK. OLIVE BAKERLY, Lacey, Mo. Filed Nov. 1, 1901. Serial No. 59,598. (No model.)

Claim.—1. In a wall-paper-display rack, the combination with a beam, of a rack revolvably supported thereon, said rack composed of detachable sections, and a plurality of rolls detachably locked and revolvably supported in each section, so that the entire rack may be dismantled for packing or shipping and each rack-section still retain its full complement of rolls.

2. In a wall-paper-display rack, the combination with a beam having a rod secured thereto and projecting upward therefrom, of a frame comprising a bottom plate and side frame, and a pair of spindles secured to the bottom plate, one projecting downwardly and the other upwardly into the space in the side frame, said spindles each having a hole in the center whereby to receive the rod or bolt which projects upwardly from the beam and upon which the rack turns.

699,479. RAILWAY TARIFF-BOOK. WILLIAM E. BINKLEY, New-ton, Kans. Filed Sept. 4, 1901. Serial No. 59,598. (No model.)

Claim.—1. A railway tariff-book with index-leaves having the index-leaf of each succeeding leaf so cut that its lower edge shall be a sufficient distance below the index-leaf of the preceding leaf to afford space for the name of a station, and its upper edge shall be a sufficient distance below the upper edge of the index-leaf of the preceding leaf to afford space on the back of each preceding leaf for the name of a station, means of one route arranged in order on the front of the index-leaf, and station-names of a second route so arranged upon the back of the successive index-leaf that they will be readable only when the position of the book is reversed; substantially as described.

2. A railway tariff-book with index-leaves having the index-leaf of each succeeding leaf so cut that its lower edge shall be a sufficient distance below the index-leaf of the preceding leaf to afford space for the name of a station, and its upper edge shall be a sufficient distance below the upper edge of the index-leaf of the preceding leaf to afford space on the back of each preceding leaf for the name of a station, means of one route arranged in order on the front of the index-leaf, and station-names of a second route so arranged upon the back of the successive index-leaf that they will be readable only when the position of the book is reversed, and columns of figures opposite the station-names upon the main portions of the several leaves to indicate cash fares and distances from the station on the fly-leaf of that leaf to each of the succeeding stations; substantially as described.

699,480. TOBACCO-PIPE. ALLEN E. BOWMAN, Philadelphia, Pa. Filed Apr. 10, 1901. Serial No. 59,571. (No model.)

Claim.—1. A pipe having a spherical bowl cut off at the top, a cover for said top, the cover being concave-convex in form and having a slot therein, and a guide device fastened to the bowl and loosely received in the slot.

2. A pipe having a straight-tube of woven fabric arranged thereto and adapted to have the smoke drawn through it, and a ball-plate secured in the tube.

3. A pipe having its stem provided with a structure in the form of a funnel-shaped tube into which the smoke-passage of the bowl leads, said tube being provided with a ball-plate at about the center of its length.

4. A pipe having a bowl, a stem fastened thereto, a mouthpiece fastened to the stem, a coupling for joining together the stem and mouthpiece, the coupling comprising a web projecting between said parts, a smoke-

tube held in the web, and a strainer in the form of a fruminated tube held in the stem and mounted on said smoke-tube.

5. In a pipe, a stem provided with an apertured web extending across its bore, a short tube carried by the web, and a tubular strainer into the outer end of which the short tube projects, said strainer being provided with a transverse partition.

6. A pipe comprising a bowl having a tube leading therefrom, a stem secured to the bowl, a mouthpiece secured to the stem, an apertured web arranged between the stem and mouthpiece, a short tube secured in the aperture of the web, and a tubular strainer into the inner end of which the tube of the bowl projects, the said strainer being provided with a transverse partition and having its outer end fitting upon the said short tube, as set forth.

7. A pipe, comprising a bowl having a tube leading therefrom, a stem secured to the bowl, a mouthpiece, a threaded band engaging the stem and mouthpiece and securing them together, said band being provided with a web having a central aperture, a short tube having a reduced end fitting in the aperture of the web, and a tubular strainer into the inner end of which the tube of the bowl extends, the said strainer being provided with a transverse partition and having its outer end fitting upon the inner end of the said short tube, as set forth.

699,481. DRIP ATTACHMENT FOR DISPENSING APPARATUS.
GEORGE W. BOTE, Washington, D. C. Filed Apr. 2, 1901. Serial No. 54,148. (No model.)

Claim.—1. A drip attachment for faucets and the like comprising a support attached to the faucet, a bracket fitted upon the support, and a horizontal swinging holder carrying a drip-receptacle and pivotally connected with said bracket, said receptacle being arranged to move upright to a position at one side of the plane of the faucet-nozzle.

2. A drip attachment for faucets and the like comprising a support, a swinging holder pivotally connected with said support, means for vertically adjusting said holder, a drip receptacle or cup carried by the holder, and yielding means for normally holding the drip receptacle or cup in vertical alignment with the faucet-nozzle.

3. A drip-cup attachment for faucets and the like comprising a support, a vertically-adjustable bracket mounted upon the support, a horizontally-swinging holder carrying a drip-receptacle and pivotally united to the bracket, and means located at the pivot for the holder for automatically returning it to a position beneath the faucet-nozzle after having been swung outside of the plane of said nozzle.

4. A drip attachment for faucets and the like, comprising a support attached to the faucet, a swinging holder carried by said support, and a drip receptacle or cup carried by said holder and arranged to move upright to a position at one side of the plane of the faucet-nozzle.

5. A drip attachment for faucets and the like, comprising a support, a pivot-bracket mounted upon said support, and having an inclined bearing shoulder or cam, and a laterally-swinging holder consisting of an arm carrying a drip-receptacle and provided with a pivot-head having an inclined face co-operating with said bearing shoulder or cam.

6. A drip attachment for faucets and the like, comprising a support, a pivot-bracket mounted upon the support and having an inclined bearing shoulder or cam, a laterally-swinging arm carrying a drip-receptacle,

and provided with a pivot-head pivotally united with the bracket and having an inclined face co-operating with said bearing shoulder or cam, and means for holding the pivot-head under yielding pressure.

7. A drip-cup attachment for faucets and the like, comprising a support, a pivot-bracket adjusted upon said support, and a horizontally-swinging holder carrying a detachable drip-receptacle and pivotally connected with said bracket said receptacle being arranged to move upright to a position at one side of the plane of the faucet.

8. A drip attachment for faucets and the like, the same comprising a support consisting of a stem or standard, a drip-receptacle carried by said support, and arranged to move upright to a position at one side of the plane of the faucet-nozzle, and a fastening clip or clips carried by the support and adapted to engage with the faucet.

9. A drip attachment for faucets and the like, the same comprising a support consisting of a standard, the drip-receptacle, and separate right-angled fastening-clips having adjustable connection with the standard and adapted to respectively engage the stem and delivery-nozzle of the faucet.

699,482. ADJUSTABLE HAME-FASTENER. FRANK J. BOTTLE, Galveston, Tex. Filed Oct. 14, 1901. Serial No. 71,904. (No model.)

Claim.—The combination of the hames, the casings provided with upper and lower sleeves, the upper sleeves of the casings being adjustably secured to the lower ends of the hames, and a bar secured in one of the lower sleeves of the casings and provided with a pair of oppositely-disposed catches for engaging the other lower sleeve, substantially as described.

699,483. ELECTRICAL APPARATUS. THOMAS H. BRADY, New Britain, Conn. Filed July 24, 1901. Serial No. 60,167. (No model.)

Claim.—1. A motor-box provided with apertures for the wires, and binding-cords within and integral with said box to receive and retain the ends of said wires, substantially as described.

2. A metallic motor-box provided with apertures for the wires, binding-cords formed integral with said box, and a cover therefor, substantially as described.

699,484. FORCE-PUMP. OTTO G. BRAHMA, Rutland, N.H. Filed July 27, 1901. Serial No. 68,971. (No model.)

Claim.—1. In a pump as described, the combination with the casing, the lift and discharge pipe sections, and a cylindrical body connected with the two pipe-sections, said body having two independent vertical compartments, said compartments having fluid passages or openings, one at the upper and the other at the lower end; of a cut-off slidably mounted on the cylindrical body, having a fluid-passage at the upper end, and a similar passage at the lower end, a piston-disk attached to and movable with the cut-off, said cut-off being movable in reverse directions by pressure on the disk in opposite directions, whereby to bring the openings in said sleeve into alternate cooperative position with the cylindrical-body openings, for the purpose described.

2. The combination with the casing 1, having a pendant pipe 1', and a lift-pipe at the top, and a mounted extension detachably joined to the upper end of the casing; of the lift and discharge pipes, a cylindrical body having its ends joined with the discharge and lift pipes, said body having a central vertical division, terminating at the ends in oppositely-extending horizontal sections, whereby to produce internal spaces *d* and *e*, a pair of water passages or openings 8 8', in the lower end, one of which opens into space *d*, the other into space *e*, said body having a second pair of water-passes 9 9', opening, respectively, into the spaces *e* and *d*, a sleeve slidably mounted on the cylindrical body for a limited movement vertically thereon, a piston-disk fixedly mounted on the sleeve, said sleeve having an opening or passage at the top, and a similar opening at the bottom, said openings being adapted to alternately close and open the two sets of passages in the cylindrical body, for the purpose specified.

3. The combination with the pump-casing; of the inlet and outlet pipe sections, the cylindrical body 6, connected therewith, said body having two independent compartments *d* and *e*, one of which *d* has direct communication with the lift-pipe section, and the other *e* has direct communication with the outlet-pipe section, said cylinder-body having openings or fluid-passages 9 9' opening, respectively, into the upper end of the compartments *d* and *e*, and like passages 8 8' opening respectively into the compartments *d* and *e*; of the sleeve 10, slidably held on the body 6, and having openings 10 10' at the upper and lower ends for operating in harmony with the openings 9 9' and 8 8', a piston-disk fixedly held on the sleeve, and means on the body for limiting the sliding movement of the sleeve, as set forth.

699,485. OVERALLS. ROBERT S. BARNHARTTER, Butler, Pa., assignor of one-half to Charles W. Dickinson, Pittsburg, Pa. Filed Dec. 28, 1901. Serial No. 67,888. (No model.)

Claim.—1. Overalls having an opening at each side, the rear flaps of said openings having cords secured thereto, said cords extending forwardly and being secured to the upper part of the apron portion, and guides upon the front overalls portion through which the intermediate portions of the cords extend; substantially as described.

2. Overalls having side openings, side guides secured to the front-flap portions and flexible connections secured to the rear-flap portions of said openings, and extending through said guides, said cords being ar-

ranged to be drawn taut by the suspender portions; substantially as described.

3. Overalls having side openings, guides secured to the front-flap portions, cords having their ends secured to the rear-flap portions of said openings, said cords extending through guides and upwardly of the apron parts, their ends being secured to the upper portion of the apron; substantially as described.

4. Overalls having side openings, guides secured to the front-flap portions, cords having their ends secured to the rear-flap portions of said openings, said cords extending through the guides and upwardly of the apron parts, their ends being secured to the upper portion of the apron, and guide-strips covering the front portions of the cords; substantially as described.

699,486. CURRYCOMB. CLAYTON P. BRIMM, Cogan Station, Pa. Filed Sept. 11, 1901. Serial No. 73,063. (No model.)

Claim.—1. The combination with a currycomb, having a rearwardly-projected handle and an angular Shank having one end connected to the handle and its opposite end applied to the top of the back of the comb, of a thumb-piece fitted between the handle and the rear edge of the comb and having a lower forwardly-directed tang driven in between the back of the comb and that part of the Shank which is connected thereto, and an upper rearwardly-directed tang driven into the handle, the outer face of the body of the thumb-piece being concaved vertically and concaved laterally, and a substantially semicircular finger-piece applied to the front of the back of the comb with its concaved face in front, its front edge projected in advance of the front edge of the comb and its rear edge rising above the latter, integral angular attaching-brackets at opposite ends of the body portion and embracing the top and front edge of the back of the comb, the outer ends of the brackets being projected beyond the respective side edges of the comb to form knockers, and fastenings pivoting the brackets and the back of the comb.

2. As a new article of manufacture, a finger-piece for currycombs, struck from a sheet of metal and consisting of a substantially semicircular body portion, provided with opposite terminal angular attaching-brackets having substantially horizontal top members lying below the upper edge of the body, terminated short of the lower front edge of the body and provided with perforations, and front members pendant from the front edges of the top members and lying in rear of the lower bottom edge of the body, the brackets being of a length to project at opposite sides of a currycomb and form knockers.

3. The combination with a currycomb, having a rearwardly-projected handle, and an angular Shank having one end connected to the handle and its opposite end applied to the top of the back of the comb, of a thumb-piece fitted between the handle and the rear edge of the comb and having a lower forwardly-directed tang driven in between the back of the comb and that part of the Shank which is connected to the comb, and an upper rearwardly-directed tang driven into the handle, the outer

face of the body of the thumb-piece being concaved vertically, concaved laterally and projected at opposite sides of the shank.

4. The combination with a carrycomb, having a rearwardly-projected handle and an angular shank connecting the handle to the back of the comb, the forward portion of the shank being provided with an up-struck corrugation, of a thumb-piece having its upper end provided with a rearwardly-projected tang which is fitted into the adjacent end of the handle, and a forwardly-projected tang provided at the lower end of the thumb-piece and inserted into the socket formed by the corrugation of the shank and the adjacent portion of the back of the comb.

5. As a new article of manufacture, a thumb-piece for carrycombs, consisting of a body having one face concaved longitudinally and concaved laterally, an integral tang projected rearwardly from one end and at the longitudinal concaved side thereof, and a second tang carried by the opposite end of the body and projected forwardly at the opposite side thereof.

699,487. BEST-SPREADER. DANIEL BROWN, Oxnorton, R. I. Filed Feb. 18, 1908. Serial No. 84,576. (No model.)

Claim.—1. The improved shot-spreader herein described, consisting of a rhomboid-shaped piece of pasteboard and a spirally-bent wire in frictional contact with the two long sides thereof, substantially as shown.

2. The combination of the shot-spreader F, made in the shape of a rhomboid, and a wire G spirally bent with short curves b and intermediate straight portions, said wire being in frictional engagement with the two long edges of the spreader F, substantially as described.

3. In combination with a loaded cartridge-shell having a wad to confine the powder and a wad to confine the shot, a shot-spreader surrounded by said shot and having a rhomboid shape, one acute corner of which is in contact with the first-named wad and the other acute corner of which is in contact with the second-named wad, and a spirally-bent wire in frictional engagement with the two long edges of said spreader and in contact with the interior surface of said shell, substantially as specified.

699,488. VEHICLE-BODY. JAMES E. BROWN and CHARLES E. BROWN, Bedford, Pa. Filed Apr. 10, 1904. Serial No. 84,178. (No model.)

Claim.—As an article of manufacture, a vehicle-body comprising a bottom, corner-posts, hays and side and end panels, all of said panels being mitered externally at the ends thereof, and provided with inner flat faces interrupted by keyways, said keyways extending entirely across said panels for the purpose of affording a firm grip throughout the entire width of said panels, the general location of the said keyways being obliquely opposite said mitered ends of said panels and parallel with the inner faces of said panels, the mitered surfaces and said keyways being parallel with each other, the said corner-posts being provided with substantially V-shaped slots and with keyways, one wall of each slot being interrupted by a keyway extending lengthwise of said post a distance representing the entire width of one of said panels, the said hays engaging with all of said keyways, the relative engagement of said mitered edges and said keyways being such that each mutually locks the other throughout the entire length thereof, whereby each braces the other throughout the entire width of said panels.

699,489. CAR-COUPLING. JOHN BROWN and SAMUEL E. CUNNINGHAM, Smithfield, W. Va. Filed Nov. 14, 1904. Serial No. 84,578. (No model.)

Claim.—1. In a car-coupling, the draw-head having a front link-opening, a vertically-swinging latch arranged transversely to the line of draft and cooperating with a headed link, a yielding trip arranged back of the link-opening and cooperating with the latch to hold the same raised, and uncoupling device associated with the latch.

2. In a car-coupling, the draw-head having a front link-opening, a vertically-swinging latch pivotally supported within the head and having

a catch-hook working over the link-opening and cooperating with the headed link, a forwardly-sprung trip-spring arranged in rear of the link-opening and adapted to engage with the latch to hold the same raised, and uncoupling device for the latch.

3. In a car-coupling, the draw-head having a front link-opening, a vertically-swinging latch pivotally mounted within the head transversely of the line of draft and provided with a catch-hook cooperating with a headed link, a forwardly-sprung trip-spring arranged in rear of the link-opening back of the latch, said trip-spring having a holding member for engagement with the latch when raised, and uncoupling device for the latch.

4. In a car-coupling, the draw-head having a front link-opening, a vertically-swinging latch pivotally mounted within the draw-head and having a catch-hook cooperating with a headed link, a forwardly-sprung trip-spring arranged in rear of the latch and having at its free end an outwardly-deflected holding-finger for engagement with the swinging end of the latch when raised, a pressure-spring arranged to exert a downward pressure upon the latch, a rigid abutment-plate arranged at the lower side of the link-opening within the vertical plane of the catch-hook, and uncoupling device for the latch.

5. In a car-coupling, the draw-head, a vertically-swinging pivotal latch having a hook cooperating with a headed link, said latch having a projecting stud, a slotted link receiving said stud, a lifting-pin engaging in the link, a side uncoupling-lever operatively related to the lifting-pin, and a top uncoupling-rod also operatively related to the coupler-pin.

699,490. TOY OR GAME APPARATUS. CHARLES E. BROWN, Norwich, Wm. Filed Oct. 12, 1904. Serial No. 78,487. (No model.)

Claim.—1. The combination of two rounding bars arranged to move toward and from each other at one end, for the purpose specified, said bars having heads at their free ends formed with matching cavities to receive a ball.

2. The combination of two rounding and tapered bars hinged together at one end, for the purpose specified.

3. The combination of two rounding bars, hinged together at one end, for the purpose specified, said bars having heads at their free ends, which heads are extended downward to bear on the supporting-surface and hold the bars inclined.

4. The combination of two rounding bars hinged together at one end, for the purpose specified, said bars having heads at their free ends formed with matching cavities to receive a ball.

699,491. SPINNING OR TWISTING FRAME. LEON W. CAMPBELL, Worcester, R. I. Filed Feb. 2, 1908. Serial No. 84,584. (No model.)

Claim.—1. A spinning or twisting machine having a plurality of means each controlled independently by the accumulation of one of the single rovings upon one of the bobbins for continuously clamping or grasping the same roving at a point adjacent to the receiving side of the series of rolls, whereby the power which rotates the rolls is utilized to again break any single roving, and stop its delivery to the rolls, the broken end being left in position for automatic engagement with the nip of the rolls at the receiving side.

2. In a spinning or twisting machine, the combination with the drawing-rolls, of a roving-clamp adjacent to the receiving side of the rolls, and clamp closing means, comprising a normally idle member of a couple of rotation, the other member of which is the lower roll of the front drawing-rolls, and connection between said idle member and the clamp, the said idle member being in close proximity to said lower roll whereby upon

the breakage of a roving at the delivering side of the rolls, and the accumulation of the roving upon said lower roll, the said side member is permitted to operate the clamp.

2. In a spinning-frame, drawing-rolls, means to stop delivery of the roving, said means comprising two apertured and relatively movable members normally forming a roving-guide, and means actuated by or through accumulation of roving upon breakage of the thread, to effect relative movement of said apertured members and part the roving.

699,493. PROCESS OF FORMING STORAGE-BATTERY PLATE. EDWIN H. CHAMBERLAIN, DEPOT, N. Y., assignor to Gould Storage Battery Company, New York, N. Y., a Corporation of West Virginia. Original application filed Mar. 3, 1900, Serial No. 707,002. Divided and this application filed Nov. 9, 1900. Serial No. 26,931. (No specimens.)

Claim.—1. The process of forming a lead storage-battery plate which consists in forming an oxidized coating on the plate by making it the anode in an electrolytic bath, the electrolyte of which produces an oxidizing chemical reaction upon the anode, whereby a continuous electrochemical effect takes place, and then shifting the plate thus provided with the oxidized coating into the position of cathode and introducing a new unoxidized plate as anode, whereby the reduction of oxid on the first-named plate serves to diminish the amount of energy required to oxidize the second plate.

2. The process of forming lead storage-battery plates which consists in exposing each of a series of plates first as the anode and then as the cathode in an electrolytic bath containing sulfuric acid and a dissolving agent, whereby a continuous electrolytic action takes place without reversing the current, and each plate being exposed as an anode in connection with a cathode comprising a preceding plate of the series which has been exposed as an anode, substantially as and for the purpose set forth.

3. The process of forming lead storage-battery plates which consists in oxidizing a plate as an anode in an electrolytic bath, then shifting the plate thus oxidized into the position of cathode, then introducing a new plate as anode and oxidizing the latter in conjunction with the previously-oxidized plate as cathode, the electrolyte being composed of acetic and sulfuric acids.

699,498. METHOD OF CLEANING SPONGY LEAD PLATES FOR STORAGE BATTERIES. EDWIN H. CHAMBERLAIN, DEPOT, N. Y., assignor to Gould Storage Battery Company, New York, N. Y., a Corporation of West Virginia. Original application filed Mar. 3, 1900, Serial No. 707,002. Divided and this application filed Nov. 9, 1900. Serial No. 26,932. (No specimens.)

Claim.—1. The process of cleaning a spongy lead plate from the active dissolving agent of an electrochemical forming-bath which consists in exposing said plate as a cathode in an electrolytic bath, each bath containing a solution relatively free from such active agent.

2. The process of cleaning a spongy lead plate and simultaneously oxidizing another plate which consists in exposing said plates respectively as cathode and anode in an electrolytic bath.

699,494. BATHING-MACHINE. FRANCIS J. WIL COOPER, Philadelphia, Pa., assignor to the Heteropne Manufacturing Company of Pennsylvania, Philadelphia, Pa., a Corporation of Pennsylvania. Filed Dec. 31, 1901. Serial No. 668,002. (No model.)

Claim.—1. The combination in a rinsing-casser, of a hopper, agitating mechanism comprising a shaft with a series of arms located therein, a rotating carrier mounted at the mouth of the hopper, the inclined bottom plate of the hopper being curved so as to extend under the carrier and in close proximity thereto, said carrier having longitudinal grooves for the reception of the rinsin, a brush serving to remove the surplus rinsin from the carrier mounted above and in close proximity thereto, means for rotating the brush the carrier and the agitating mechanism simultaneously, with feeding mechanism arranged below the carrier to which the rinsin are fed, said mechanism comprising a feeding-roll driven with the rest of the mechanism and a yielding pressure-roller engaging the feeding-roll and receiving its movement from the same, said pressure-roller being adjustable from and toward the feeding-roll.

2. The combination in a rinsing-casser, of the toothed or serrated feeding-roll, a yielding pressure-roller in engagement with the feeding-roll and adjustable from and toward the same, a frame in which said rolls are mounted, a hopper having an inclined bottom with a curved extension connected thereto also carried by the frame, an outlet in the front of the

hopper at the bottom leading to the seeding mechanism, a longitudinally-grooved carrier mounted in bearings in the frame and arranged within the hopper above said opening and adjacent to the curved extension of the bottom plate, a detachable front plate extending from the seeding-roll to a point in front of the carrier, said plate forming with the extension of the hopper-bottom a chute, a rotating clearing-brush mounted above the grooved carrier, a shaft with projecting fingers mounted within the hopper and curving to separate the refuse placed therein, and means for driving the rotating mechanism carrier-brush and seeding-roll simultaneously, so that the refuse may be fed continuously to the seeding mechanism, the pressure-roller being driven by its engagement with the seeding-roll and being adjustable from end toward the same to operate upon refuse of different size.

699,495. APPARATUS FOR MAKING COFFEE, DR. FRANK W. DALLISON, Cambridge, Mass. Filed Mar. 14, 1901. Serial No. 51,041. (No model.)

Claim.—1. An apparatus for making coffee or the like, having, in combination, a closed steam-chamber, a decoction-chamber in said steam-chamber, and a coffee-holder within the decoction-chamber, said coffee-holder being provided with a pipe leading from its bottom upward and out through the side of the steam-chamber near its top, said decoction-chamber being in communication with said steam-chamber and coffee-holder, substantially as described.

2. An apparatus for making coffee or the like, having, in combination, a closed steam-chamber, a decoction-chamber in said steam-chamber, and a coffee-holder within the decoction-chamber provided with a pipe leading from its bottom, said decoction-chamber being in communication with said steam-chamber and coffee-holder, substantially as described.

3. An apparatus for making coffee or the like, having, in combination, a steam-chamber, a decoction-chamber, a coffee-holder in said decoction-chamber provided at or near its bottom with perforations communicating with the decoction-chamber and provided with a pipe leading from its bottom, substantially as described.

4. An apparatus for making coffee or the like, having, in combination, a closed steam-chamber, a decoction-chamber in said steam-chamber, a coffee-holder within the decoction-chamber provided with a pipe leading from its bottom upward and out through the side of the steam-chamber near its top, substantially as described.

5. An apparatus for making coffee or the like, having, in combination, a closed steam-chamber and a decoction-chamber in said steam-chamber having communication with the steam-chamber above the level of the liquids adapted to be contained in both chambers, substantially as described.

6. An apparatus for making coffee or the like, having, in combination, a closed steam-chamber, a decoction-chamber in said steam-chamber having communication with the steam-chamber above the level of the liquids adapted to be contained in both chambers, and a coffee-holder

in and having communication with said decoction-chamber, substantially as described.

7. An apparatus for making coffee or the like, having, in combination, a closed steam-chamber, a decoction-chamber in said steam-chamber having pressure communication with said steam-chamber, and provided with an outlet through the steam-chamber for the discharge of the decoction, and a coffee-holder in and having communication with said decoction-chamber, substantially as described.

8. An apparatus for making coffee or the like, having, in combination, a closed steam-chamber, a decoction-chamber in said steam-chamber, a coffee-holder in and having communication with the decoction-chamber and a pipe passing through the decoction-chamber, leading from the bottom of the coffee-holder upward and out through the side of the steam-chamber, substantially as described.

9. An apparatus for making coffee or the like, having, in combination, a decoction-chamber, a coffee-holder in said decoction-chamber provided near its bottom with separated bands of perforations affording the only means of communication for liquids between the coffee-holder and the decoction-chamber, substantially as described.

699,496. UNIVERSAL PRINTING-MACHINE, CLARENCE L. DAWSON, Jacksonville, Ill. Assignor of one-half to Walter E. Graham, Jacksonville, Ill., and Frank McCuddy, Clinton, Ill. Filed Dec. 12, 1901. Serial No. 50,007. (No model.)

Claim.—1. A universal letter-type comprising independently-movable block-sections having inter-joints at the corners and each having its face joining onto its neighbor to form a continuous surface and each having a non-rotatable stem rising therefrom with a spiral spring around it, and a back plate supporting said stems and blocks, substantially as shown and described.

2. A universal letter-type comprising independent movable block-sections, the longitudinal members and the transverse members of the latter having at the point of intersection a common movable member adapted to act unobscurely with the longitudinal member or exclusively with the transverse member, substantially as described.

3. A printing device comprising a universal letter-type having independently-movable printing-blocks abutting against each other and having stems rising therefrom and springs for holding them up, a horizontal roller having projections on its periphery for selecting and depressing the stems, said rollers being arranged in parallel position above the printing-type and being made vertically adjustable with an equal movement at each end, a supporting-frame carrying each end of the roller, means for equally depressing each end of said frame, and means for rotating the roller to enable it to make proper selection, substantially as described.

4. A printing device comprising a universal letter-type having independently-movable printing-sections with spring-biased stems, arranged

in rows, and a corresponding set of selecting-rollers having peripheral projections and indentations, said rollers being arranged above the rows of stems and having gear-wheels connecting them for an equal and simultaneous rotary adjustment substantially as described.

5. A printing device comprising a universal letter-type having independently-movable printing-sections with spring-biased stems attached in the same said stems being arranged in three rows with the middle row of stems the highest, and three triangularly-arranged rollers with peripheral projections and indentations and connecting-gears, the upper roller being arranged above the row of highest stems substantially as described.

6. A printing device consisting of a universal letter-type having independently-movable printing-sections each provided with upwardly-projecting and spring-biased stems, a selecting-roller having peripheral projections and indentations arranged in different circular series, means for rotating the roller, and means for shifting the roller lengthwise in such a way as to bring a different series of projections into range of engagement with the stems substantially as described.

7. A printing device consisting of a universal letter-type having independently-movable printing-sections with upwardly-projecting spring-biased stems, a frame for said letter-type made vertically adjustable to bring the type into printing contact with the paper, and a frame within said type-frame made vertically adjustable in relation to the type-frame, an adjustable selecting device for picking out the selected sections of the type, said selecting device being carried in the lower frame, springs for holding up the two frames, and means for depressing them, whereby the selecting-device frame descends first to effect the selection of the type-sections and after which the entire type mechanism descends to print the impression as described.

8. A printing device of the kind described having two or more selecting-rollers, and gears for connecting them together, one of said rollers having an extended shaft bearing an index-wheel having letters and numerals displayed thereon and having a correspondingly-notched flange, and a locking-batch engaging with said notched flange to determine the position of the selecting-roller as described.

9. A printing device of the kind described, having one or more selecting-rollers each provided with a separate circular series of projections and indentations, a frame supporting the journals of the same made adjustable lengthwise with the rollers and having pin A, and a locking spring-bar B' with holes A' and B' adapted to fit the longitudinal adjustment of the rollers as described.

10. In a printing device of the kind described the combination with the printing-type-frame H and its printing device; of the dotted and plates G' and top plate G, the outside frame-plates G' with outward legs G', the headed pins g' with springs g' supporting legs G', and an independent frame H' arranged inside frame G' and carrying the selecting-rollers and means for giving a vertical motion to said frame substantially as described.

11. In a printing device of the kind described, the combination of the frame carrying the printing-type, the independently-movable frame carrying the selecting-rollers, the latter being provided with the horizontal bars G', and the lever-bar I having cams i' and the parallel bar I' having corresponding cams substantially as and for the purpose described.

12. In a printing device of the kind described, the combination of the carriage-frame F' having outward legs F', and the selecting-roller frame G' having outward legs G' carrying vertical headed pins G' and springs g' coiled around the pins between its head and the outward leg F' substantially as described.

13. In a printing device of the kind described, the combination of a base-board A, the end frame B' the rails B', the printing-carriage C mounted thereon, and the paper-feeding mechanism consisting of rubber-foam wheels B' B', the shaft B' with groove b adjustably connected to wheel B', means for rotating said shaft and the adjusting rollers B' B' the latter being made of a length to accommodate the adjustment of wheel B' substantially as described.

14. In a printing device of the kind described, the combination with the base-board A, its pad A', and the paper-feed device; of the paper-straightening tension wire or cord A' arranged at the front of the base-board substantially as described.

699,497. WARE-HOUSE CHIMNEY FOR CLOSET-BOWLS, ALBERT DELLINGER, Los Angeles, Cal. Filed Jan. 8, 1902. Serial No. 50,412. (No model.)

Claim.—The combination with the neck or tubular portion of a closet-bowl formed with an annular extension having a downwardly-projecting flange; of a vent-pipe, a collar fixed to the upper end thereof provided with capillary peripheral legs, and two of the diametrically opposite ones of which having reversely-arranged undercut channels, the two other diametrically opposite legs curving as steps, and both with heads adjustably connected to said extension, said heads being arranged between the step-legs and channel-legs and adapted to slide on the periphery of

the collar so as to permit of said heads of said bolts engaging with the reversely-arranged channel-legs, substantially as specified.

699,498. COAT, JAMES DE MATO, Mount Vernon, N. Y. Filed July 8, 1901. Serial No. 51,074. (No model.)

Claim.—1. A coat or similar garment composed of a single piece, said piece comprising a body portion having side extensions, a central upwardly-directed portion in which the neck-opening is formed, and side extensions connected with said upwardly-directed portion and which form the shoulders and sleeves of the garment, said parts being adapted to be folded so as to form a garment, and the body portion being provided at the top where the side extensions join said body portion and where the sleeves connect with the upwardly-directed extensions with downwardly and upwardly directed darts, the inner lines or edges of which are curved inwardly, substantially as shown and described.

2. A coat or similar garment composed of a single piece, the blank from which it is formed comprising a body portion having side extensions, a central upwardly directed portion in which the neck-opening is formed, said neck-opening being provided at the bottom thereof with upwardly-directed members designed to form a part of the lapels of the garment, side extensions connected with the upwardly-directed portion and designed to form the shoulders and sleeves of the garment, said parts being adapted to be folded so as to form said garment, substantially as shown and described.

3. A coat or similar garment composed of a single piece, the blank from which it is formed comprising a body portion having side extensions, a central upwardly directed portion in which the neck-opening is formed, said neck-opening being provided at the bottom thereof with upwardly-directed members designed to form a part of the lapels of the garment, side extensions connected with the upwardly-directed portion and designed to form the shoulders and sleeves of the garment, said parts being adapted to be folded so as to form said garment, and the body portion being also provided at the top of the side extensions with downwardly-directed darts, the inner lines or edges of which are curved inwardly, substantially as shown and described.

4. A coat or similar garment composed of a single piece, the blank from which said piece is formed comprising a body portion having side extensions, a central upwardly-directed portion in which the neck-opening is formed, said neck-opening being provided at the bottom thereof with upwardly-directed members designed to form a part of the lapels of the garment, side extensions connected with the upwardly-directed portion and designed to form the shoulders and the sleeves of the garment, said parts being adapted to be folded so as to form said garment, and the body portion being also provided at the top of the side extensions and at the bottom of the sleeve extension with downwardly and upwardly directed darts, substantially as shown and described.

699,499. FOUNTAIN-PEN, ROBERT S. BROWN, Kansas, Mo. Filed Dec. 31, 1901. Serial No. 51,511. (No model.)

Claim.—In a stylographic pen, the combination of a transparent barrel terminating in a point formed with an ink duct or channel, said

barrel having formed integrally with its opposite end an inwardly-projecting capillary tube open at each end and spaced from the barrel to form a chamber whereby is produced a capillary attraction which prevents the escape of writing fluid when the pen is in an inverted position, substantially as set forth.

699,500. MOUTHPIECE FOR BOILER-FURNACE. WILLIAM H. DUNLEY, Springfield, Mass. Filed Jan. 14, 1902. Serial No. 68,670. (No model.)

Claim.—1. The combination with a boiler-furnace, a hollow metal mouthpiece fitting therein, and extending around the entire mouth of the furnace, a series of braces or division walls in the mouthpiece having openings, and forming water jackets or chambers, and water-supply means, and the draw-off pipe for sediment or foreign matter.

2. The combination with a boiler-furnace, the mouthpiece having a hollow compartment extending around its entire construction, a series of perpendicular walls in the horizontal portion of the mouthpiece and a series of horizontal walls in the vertical portion, said walls having openings and forming a series of communicating jackets or chambers, and water-supply means.

3. A mouthpiece for boiler-furnace, consisting of a hollow casing adapted to fit the mouth of the furnace, division-walls in the casing connecting the walls of the mouthpiece and forming a series of water-jackets, said division-walls each having an opening forming communication throughout the entire mouthpiece and also bracing the walls thereof.

699,501. BUTTER-CUTTER. ALFRED DUBOVAR, Atlantic City, N. J., assignor of two-thirds to Jacob Myers, Daniel Myers, and James G. Fleming, Atlantic City, N. J. Filed Dec. 11, 1901. Serial No. 68,431. (No model.)

Claim.—1. In a butter-cutter, a body portion, open at top and bottom, cutters passing across the bottom thereof, and a movable cutter suitably mounted in substantially the center of said body portion and adapted to be operated after the first-mentioned cutters have cut the butter where-by the latter is cut in half.

2. In a butter-cutter, a body portion, cutters secured to the bottom thereof, passages in the body portion, a frame having side bars moving in said passages and a cutter secured to said frame and adapted to move therewith.

699,502. BUCKLE. ALBERT E. DOWLAND, Southampton, N.Y. Filed Oct. 4, 1901. Serial No. 71,002. (No model.)

Claim.—A buckle or strap fastener comprising the socket-section, and the wedge-section fitting therein, and having the spring wedge tongues separated by an interval from the base of the wedge, and the lateral guard-walls for said tongues, substantially as specified.

699,508. DOUBLE-CYLINDER HYDROCARBON-MOTOR. FRIEDRICH DÖRFLER, Schönebeck, Germany. Filed July 8, 1902. Serial No. 82,004. (No model.)

Claim.—1. A hydrocarbon-motor comprising two parallel cylinders, two oppositely-moving pistons in each cylinder, a driving-shaft journaled between said cylinders, a crank mounted on the driving-shaft, and connections between the pistons and crank-shaft allowing the pistons in both cylinders to move apart and to move together simultaneously.

2. A hydrocarbon-motor comprising two parallel cylinders, two oppositely-moving pistons in each cylinder, a driving-shaft journaled between said cylinders, a crank mounted on the driving-shaft, and connections between the crank and the pistons comprising a swinging lever for each piston, a connecting-rod between the crank-shaft and each two adjacent swinging levers.

3. A hydrocarbon-motor comprising two parallel adjacent cylinders each having two oppositely-moving pistons, an inlet-valve and an exhaust-valve, a crank-shaft mounted between the two cylinders and connected with the above-said pistons, a cam-wheel rotatable upon the crank-shaft, mechanism driving the cam-wheel, and a swinging arm on each of said cylinders actuated by the said cam-wheel and operating the exhaust-valves.

699,504. CARBURIZER FOR EXPLOSIVE-ENGINEER. JAMES P. DUNLEY, Springfield, Mass. Filed Nov. 30, 1901. Serial No. 68,670. (No model.)

Claim.—1. In a carburizer, the combination of a mixing-chamber having a longitudinal slot in its side wall, a partition-ring in the chamber having a central axial aperture and also other apertures, an inlet-pipe arranged to discharge hydrocarbon in said central aperture, a movable collar located in the chamber above said ring and arranged to control said other apertures in the partition by its axial movement, said collar being so disposed as to cover said slot in its several positions, and a screw secured to the collar and projecting through the slot, the screw being arranged to adjust the collar from the outside of the carburizer and also to clamp the collar in its position of adjustment.

2. In a carburizer, the combination of the chamber, D, having the slot, a; the ring, F, having a central aperture and also the apertures, a; the nozzle, G, arranged to discharge the hydrocarbon in said central aperture; the ring, G, arranged to move axially and thereby control said apertures, a; the ring being so disposed as to cover the slot, a, in its various positions; and the screw, c, tapped into the ring, G, and projecting through said slot; said screw being arranged to move the ring, G, and to clamp it in its position of adjustment.

3. In a carburizer, the combination of a mixing-chamber, a partition-ring in the chamber having a central axial aperture and also other apertures, an inlet-pipe for the hydrocarbon arranged with its discharge end located in said central aperture, a movable collar located in the chamber above said ring and arranged to control said other apertures in the partition by its axial movement, said collar having its lower edge tapering outwardly toward its axis, said partition having the part in opposition to said tapering portion of the collar of a corresponding taper, means for moving the collar axially, and means for securing the collar in its position of adjustment.

4. In a carburizer, the combination of the chamber, D; the ring, F, having a central aperture and also other apertures, a; the nozzle, G, arranged to discharge hydrocarbon into the central aperture; the ring, G, arranged to move axially and having its lower edge tapering outwardly toward its axis; the ring, F, having the upper flange forming the margin of the apertures, a, of a taper corresponding to the tapering part of the collar, G; means for moving the collar, G, axially; and means for securing the collar in its position of adjustment.

699,505. CAR-COUPLING. JOHN E. B. RADAR, Philadelphia, Pa. Filed May 14, 1901. Serial No. 68,680. (No model.)

Claim.—1. The combination, to form a car coupling member, of a coupling head, a knuckle pivotally mounted in said head, a locking block movable in an approximately vertical plane, adapted to be automatically elevated by the knuckle tail in its rearward movement, and, after such rearward movement, to descend by gravity into position to lock the knuckle tail, a locking block elevating device connected with said locking block and extending to the exterior of the head, a trigger pivotally mounted, at a point on one side of its center of gravity, to the bottom portion of the head, extending through an opening in the top of said head, and adapted to be manually tilted with respect to its pivot, and also adapted to be tilted by the knuckle tail in its movement, and means by which said trigger automatically engages the locking block when the latter is in elevated position.

2. The combination, to form a car coupling member, of a coupling head, a knuckle pivotally mounted in said head, a locking block movable in an approximately vertical plane, adapted to be automatically elevated by the knuckle tail in its rearward movement, and, after such rearward movement, to descend by gravity into position to lock the knuckle tail, an elevating device connected with said locking block and extending to the exterior of the head, a trigger pivotally mounted, at a point on one side of its center of gravity, to the bottom portion of the head, and extending through an opening in the top of said head, and adapted to be manually tilted with respect to its pivot, means by which said trigger automatically engages the locking block when the latter is in an elevated position, and a contact block carried on said trigger and projecting beneath the locking block in position to be encountered, and, with the trigger, tilted, by the knuckle tail.

3. The combination, to form a car coupling member, of a coupling head having a trigger opening formed in its top and a trigger opening formed in its bottom, a knuckle pivotally mounted in the vicinity of the opening formed in its bottom, a knuckle pivotally mounted in said head, a movable locking block adapted to be automatically elevated by the knuckle tail in its rearward movement, and, after such rearward movement, to descend by gravity into position to lock the knuckle tail, a locking block elevating device connected with said locking block, and extending to the exterior of the head, a trigger extending through the trigger opening in the top and bottom of the head and having a pivotal connection with the top, said pivotal connection being at one side of the center of gravity of the trigger, means by which said trigger automatically

ally engages the locking block when the latter is in elevated position, and a contact block carried on said trigger and projecting past the locking block in position to be encountered and, with the trigger, tilted, by the knuckle tail.

699,508. ELECTRIC CONTROLLER. ARTHUR C. BARWOOD, Cleveland, Ohio, assignor to the Electric Controller and Supply Company, Cleveland, Ohio, a Corporation of Ohio. Filed Dec. 20, 1901. Serial No. 67,003. (No model.)

Claim.—1. In an electric controller, the combination of substantially parallel plates of insulating material, series of contact-platen supported thereon, a lever having a member or members extending adjacent to said plates and contact-brushes carried by said members, said brushes being placed and connected so that they form electrical connection between certain of the contact-platen when the lever is operated, substantially as described.

2. In an electric controller, the combination of resistance, vertical and parallel plates of insulating material, a series of contact-platen mounted on each of said plates, a lever having two side members each adjacent to one of said plates, and carrying brushes, said brushes being placed to electrically connect certain of the contact-platen on the insulating-plate to which it is adjacent, substantially as described.

3. In an electric controller, the combination of resistance, parallel plates of insulating material carrying contact-platen electrically connected with said resistance, a U-shaped lever extending over said plates carrying a brush on each of its side members placed to engage said contact-platen, substantially as described.

4. The combination of a frame, resistance, two parallel plates of insulating material mounted on the frame, groups of contact-platen connected to the resistance on each of the insulating-plates, a lever having members adjacent to the surfaces of the insulating-plates, and brushes on each of the said members, the same being insulated therefrom and constructed to electrically connect certain of the contact-platen on each plate when the lever is operated, substantially as described.

5. In an electric controller, the combination of a frame carrying two plates of insulating material parallel to each other and lying in substantially vertical planes, two series of contact-platen on each of said plates, an operating-lever having two members of which one extends adjacent to each insulating-plate, brush-holders on each member carrying brushes, the same being constructed to electrically connect the series of contacts on each plate, said brushes being insulated from the lever and from each other, substantially as described.

6. In an electric controller, the combination of a frame carrying two plates of insulating material parallel to each other and supported on the frame in substantially vertical planes, two series of contact-platen on each of said plates as operating-lever having two members of which one extends adjacent to each plate, a brush-holder fixed to each of said members of the lever but insulated therefrom, two sets of brushes on each holder placed to bear upon the series of contacts of their respective plates, the brushes of each holder being electrically separated to each other, substantially as described.

7. The combination of a frame, a U-shaped lever pivoted thereto, insulating-plates carried in vertical planes by the frame and adjacent to the side members of the lever, two series of contact-platen on each of the plates, the same being arranged on the ends of double whose centers are

coincident with the pivotal line of the lever, brush-holders with brushes carried by the side members of the lever, the same forming an electrical connection between the car of contacts upon each plate and the levers operated, substantially as described.

8. In an electric controller of the character described, the combination of a frame, a U-shaped lever pivoted to the lower portion of the frame, contact-pieces lying in vertical planes carried by the frame and brushes carried by the lever, said frame being provided with guides engaging the side members of the lever whereby lateral motion of the same is prevented, substantially as described.

9. In an electric controller of the character described, the combination of a frame, a U-shaped lever pivoted to the lower portion of the frame, contacts lying in planes at right angles to the pivot of the lever also carried by the frame, and brushes carried by the lever, the upper portion of the frame having on each side guide-pieces, the side members of the lever extending between said guide-pieces and the frame and being thereby secured against lateral motion, substantially as described.

10. The combination with an electric controller of the character described, of a lever pivoted to said controller, a brush-holder fixed to the lever and movable with it in a plane at right angles to its pivot, a series of brushes pivotally attached to the holder, each of the same having a projecting portion together with springs carried by the brush-holder and bearing upon said projecting portions of the brushes, substantially as described.

11. The combination with an electric controller of the character described, of a lever pivoted to said controller, a brush-holder fixed to the lever and movable with it in a plane at right angles to its pivot, a series of bolts projecting from the holder, T-shaped brushes pivoted to the holder, each having one of its projecting portions engaging a bolt with a spring on each bolt bearing upon said projecting portion of its respective brush, with a spring on each brush, substantially as described.

699,507. CURTAIN-POLE RING. GEORGE HANCOCK, Brooklyn, N. Y., assignor of one-half to George Grah, Glendale Station, N. Y. Filed Nov. 11, 1901. Serial No. 91,578. (No model.)

Claim.—A curtain-pole ring consisting of an exterior ring provided with a concave recess at its exterior circumference and radial recesses at its inner upper portion, a wire ring spring into the recess formed at the inner circumference of the exterior ring, centrifugal-rollers placed in the radial recesses, and a keeper extending over the ends of the wire ring and exterior ring, and provided with an eye at its lower end, substantially as set forth.

699,508. GRIPPING MECHANISM FOR FEEDING METAL STRIPS. DR. WILLIAM FRIED, Philadelphia, Pa., assignor to Steel Rods Manufacturing Company, Philadelphia, Pa., a Corporation of Pennsylvania. Filed Dec. 20, 1901. Serial No. 94,695. (No model.)

Claim.—1. In a mechanism of the character described, a case having a limited range of reciprocating movement, a gripping and feeding mechanism carried by said case, mechanism for reciprocating the case, means for limiting the movement of the case independently of the full movement of the reciprocating mechanism, and means controlled by the reciprocating mechanism during its movement independent of the case arranged to operate the gripping and feeding mechanism only during said independent movement.

2. In a mechanism of the character described, a case, a rail or guide wherein the case is arranged to reciprocate, two jaws pivoted within the case, a shaft, a head formed on said shaft and extending within the case,

means for locking the head to the case during other movement of the case, means for shifting the head in the case at the end of each reciprocation of said case, and mechanism controlled by the head arranged when the head is shifted to the case to open and close the jaws.

3. In a mechanism of the character described, a case, two gripping-jaws pivoted within the case, springs adapted to separate said jaws, a shaft arranged to reciprocate the case, a head formed on said shaft and arranged to slide within the case at or near the end of each reciprocating movement of said case, and toggle or links connecting the head with the gripping-jaws, said toggle or links adapted as the head is shifted in one direction to close the jaws against the tension of the springs.

699,509. COUPLING FOR RAILROADS. DR. JOSEF FURBER, Philadelphia, Pa., assignor to Thomas Devlin & Co., Philadelphia, Pa., a Firm. Filed Jan. 20, 1902. Serial No. 91,880. (No model.)

Claim.—1. A coupling for the members of a rail consisting of sections, one of which is formed with a neck, and the other section provided with a nut, the latter being adapted to freely receive said neck, and a screw which is passed through the side of one section, through said nut and into the neck of the other section.

2. A coupling for a rail consisting of sections, one of which has a neck with a nut on one side, an opening therethrough, a contiguous section having a socket and an opening opposite to the latter, and a screw passing through said opening and socket into the opening of the neck and socket of the other section.

3. A coupling consisting of sections, one of which has a neck thereon, and a socket on one side thereof, and another section having a socket and opening in opposite sides and a screw passing through said opening and socket into the neck and socket of the other section, said sockets having flat faces which are in contact and adapted to ride one on the other in the adjustment of the coupling and rest firmly on each other in the fixed completed condition of the latter.

699,510. MIMO-TEACHING APPARATUS. JAMES E. FORBES, Toronto, Canada. Filed Sept. 24, 1902. Serial No. 94,977. (No model.)

Claim.—1. In mimo-teaching apparatus a board having the face of the manual staff displayed thereon in combination with two supplemental boards detachably secured respectively to the lower left-hand edge and the upper right-hand edge of the main board and having large faces above and below the staff displayed thereon, substantially as and for the purpose specified.

2. In mimo-teaching apparatus a board having the face of the manual staff displayed thereon in combination with two supplemental boards attached respectively to the lower left-hand edge and the upper right-hand edge of the main board and having large faces above and below the staff displayed thereon; and a detachable diagonal strip extending across the three boards and provided with projecting pins opposite any or all of the lines and spaces of the said boards, substantially as and for the purpose specified.

3. In mimo-teaching apparatus a board having the face of the manual staff displayed thereon in combination with a detachable strip extending across the said board and provided with projecting pins opposite the lines and spaces of the said board, substantially as and for the purpose specified.

4. In mimo-teaching apparatus a board provided with a series of projecting pins arranged in pairs in combination with a number of bars suitably spaced to agree with the lines of the staff and which may be laid upon the pins to represent the long lines of a musical staff, and short bars to represent the higher lines of the staff, substantially as and for the purpose specified.

5. In mimo-teaching apparatus a board provided with a series of projecting pins arranged in pairs in combination with a number of bars suitably spaced to agree with the lines of the staff and which may be laid upon the pins to represent the long lines of the staff, and a series of blocks marked with the names of the spaces and provided with projecting spines or pins for attachment to the board between the said bars, substantially as and for the purpose specified.

699,511. SAFETY ATTACHMENT FOR ELEVATORS. WALTER A. FURBER, Brooklyn, N. Y. Filed Mar. 25, 1902. Serial No. 94,980. (No model.)

Claim.—1. In an elevator, the combination with its valve-chamber, of an electromagnet and its circuit, a clear for said chamber operated by the opening of an elevator-door, and a lock or clutch mechanism controlled by said magnet adapted to restrain the shaft from movement in either direction when the motive power is cut off, and adjustable for different normal positions of such shaft or part.

2. The combination with an elevator valve-chamber, of a pair of oppositely-toothed segmental ratchets thereon, their pawls, means for adjusting said ratchets to different normal positions of said shaft, the electric circuit, the electromagnet and its circuit, the clear for said chamber operated by the opening of an elevator-door, substantially as and for the purpose set forth.

3. In an automatic stop device for elevators, in combination with its valve-chamber, the disks adjustable on said shaft, each having a small arc only ratchet-toothed, the teeth of one being oppositely inclined to those of the other, the pawls, the toothed segments of the disks being so positioned as to be presented to the pawls only when the shaft is in normal or valve-closing position, and means operative by the opening of an elevator-door for automatically bringing each pawl into engagement with said teeth.

4. The combination with an elevator valve-chamber, of the segmentally-toothed ratchet-disks independently adjustable thereon, the oppositely-disposed pawls, the electromagnet and its circuit, the loose operative connection between its armature and said pawls, and the circuit-clear actuated by the opening of an elevator-door, all substantially as and for the purpose specified.

5. The combination with the valve-chamber, the ratchet-disks thereon, the pawls, the magnet and its armature, of the over-bar and links connecting said armature and pawls, said connections being sufficiently free or loose to permit either pawl to drop into engagement with a notch upon its ratchet while the other pawl may be resting upon the apex of a tooth.

6. The combination with the valve-chamber, the segmental ratchet-disks thereon, their pawls, the magnet and its armature, of the loose connection between said armature and pawls, permitting, when the magnet is energized, either pawl to drop into engagement with its ratchet irrespective of the position of the other pawl, and whereby both pawls are thrust equally away from their ratchets when the magnet is deenergized.

7. In combination with the electric circuit in a safety device of the character described, a secondary circuit in multiple with the main circuit and having an independent switch automatically closed while the car is

running, a mechanical trip for the valve-chamber-operating means, and a magnet in the secondary circuit controlling said trip, substantially as and for the purpose specified.

8. In combination with an electrically-operated locking device for an elevator valve-chamber controlled by circuit-clears operative by the opening or closing of elevator-chamber doors, a secondary circuit in multiple with the main circuit, normally closed while the car is running and opened when the car is at rest, a mechanical trip adapted to engage the valve-chamber cable and to operate the same in turn the shaft into valve-closing position, and a magnet in the secondary circuit controlling said trip.

699,512. THILL-COUPLES. BERTON S. FURBER, Vernon, N. Y. Filed Sept. 2, 1901. Serial No. 74,000. (No model.)

Claim.—1. In a thill-coupling of the within-described class, the clip-net formed with duplex locking-shoulders projecting laterally from the sides thereof, and the locking-bolt having the lower and portions of its arms disposed apart to receive between them the shoulders, and the upper and portions of said arms disposed parallel and nearer to each other to closely embrace the sides of the net and united by a horizontal bar to ride upon the top of said net, all constructed and combined to operate substantially as set forth and shown.

2. In a thill-coupling, the combination with the coupling-pin, a spring connected at its front end to said coupling-pin, and a lever connected to the opposite end of said spring, of a lock-plate secured to the axle and adapted to be reversed and forward and provided with two pairs of shoulders on its side edges and disposed at the rear and front respectively, and a bolt connected at one end to said lever and formed at its opposite end so as to pass over the lock-plate and terminated with a laterally-constructed neck to engage the rear pair of shoulders on said lock-plate substantially as described.

699,513. APRON AND APRON-TIE. WILLIAM GARR, Los Angeles, Cal. Filed Jan. 27, 1901. Serial No. 89,000. (No model.)

Claim.—1. In an apron, the combination, with a sheet or flat piece of material forming the apron-body provided with apertures for the reception of hooks, of an adjustable take-up comprising a band, two hooks to engage in said apertures and a take-up buckle, said buckle being provided with three bars, and one end of the band being permanently secured to the middle bar of the buckle and the remaining portion of the band being passed, first through the eye of one of the hooks, then through the buckle, then through the eye of the other hook, and then having its free end passed through the buckle, each fold or layer of the band passing under the ends of the buckle and over the central portion whereby they are thrown out of line with the main portion and are caused to bind against the bars of the buckle and prevent slipping by friction only.

2. A new article of manufacture, an adjustable detachable tie for aprons comprising a retaining portion, a band permanently secured to said retaining at one end and having its opposite end passed through the re-

tainer in reverse directions and adjustably secured thereto by friction only so as to form a variable loop on each side of the container, and a fastener in each loop.

699,514. MACHINE FOR POLISHING RINGS. GEORGE E. GAO, Elm, Portsmouth, Va. Filed Jan. 10, 1902. Serial No. 99,129. (No model.)

Claim.—1. An apparatus substantially as described comprising a carrier for the polishing-strap provided with opposite heads having the plurality of openings for the chains of the intermediate braco, the intermediate braco having at its ends threaded chains passing through the openings in the opposite heads, the nuts on said chains on opposite sides of the heads, the springs on the outer sides of the heads and held by the nuts thereof and deflected to operate upon the strap-holding bolts, the strap-holding bolts and their nuts, the guideways upon which the strap-carrying heads reciprocate, means for reciprocating the carrier and means for holding the work to be operated upon substantially as set forth.

2. The combination in a machine substantially as described of a reciprocating strap-carrier, guideways for said carrier, and a ring-holder provided with means for securing the ring in a plane approximately parallel with the direction of movement of the strap-carrier whereby the ring will be secured with its axis at a right angle to the line of movement of the strap-carrier substantially as set forth.

3. The combination of the reciprocating carrier for the polishing-strap having opposite heads, devices for securing the opposite ends of the strap, said devices being movable in the opposite heads of the carrier, and springs by which to give tension to said strap-securing devices substantially as set forth.

4. The combination in an apparatus substantially as described with the opposite carrier-heads of an intermediate braco extending between said heads and provided at its ends with the three threaded chains extending through the heads, and nuts on said chains on opposite sides of the heads, substantially as set forth.

5. In an apparatus substantially as described the combination with the strap-carrier heads of the bolts movable in said heads and provided with means for securing the ends of the polishing-strap, and the springs acting upon said bolts whereby to give tension to the same substantially as set forth.

6. A machine substantially as described comprising the reciprocating carrier provided with means for securing the opposite ends of a polishing-strap and means for supporting said carrier of a ring-holder having a support and securing means for the ring, and a device for said ring adapted to permit the same to turn in one direction and to lock it from turning in the opposite direction substantially as set forth.

7. The combination in a machine substantially as described with means for supporting the ring to be polished, of a device mechanism by which to lock said ring from turning in one direction and to permit it to turn in the opposite direction substantially as set forth.

8. In a machine substantially as described the combination of a table for supporting the ring, a keeper arranged at its ends to overlap the ring and hold it upon the table, and means for securing the keeper substantially as set forth.

9. The combination of the ring-holder, means for securing the ring, and a device-pawl arranged to operate on the ring and to prevent the same from turning in one direction, substantially as set forth.

10. In a machine substantially as described the combination of the reciprocating carrier for the polishing-strap, a holder for the work to be polished and guides for said holder extending in a direction transverse to the path of the strap-carrier and means for adjusting the work-holder substantially as set forth.

11. The combination in a machine substantially as described of the reciprocating carrier, a polishing-strap connected at its ends with the said carrier and adapted between its ends to be looped around the work to be polished, and a holder for said work substantially as set forth.

699,515. DOOR-KNOB. WILSON F. GILBERT, New Britain, Conn., assignor to P. & F. Curtis, New Britain, Conn., a Corporation of Connecticut. Filed Feb. 17, 1902. Serial No. 94,572. (No model.)

Claim.—A door-knob comprising a knob, a supporting-shoulder thereon, a mandrel bearing upon said supporting-shoulder a portion of said knob being flanged inside of said mandrel to secure the same in place, the outer edge of said mandrel being curved inwardly and mandrel forming front and rear bearing-surfaces, an envelope for said mandrel, a flange on the knob-shank and flange bearing against the inner edge of said envelope.

699,516. MANUFACTURE OF CELLULOSE ARTICLES. JULIUS HACHINGER, Hoboken, N. J. Filed Feb. 6, 1902. Serial No. 92,688. (No model.)

Claim.—1. The process herein described of ornamenting celluloid articles which consists in making strips or bands of celluloid, formed of differently-colored pieces of celluloid cemented together, and to the articles to be ornamented, substantially as set forth.

2. The process herein described of ornamenting celluloid articles, which consists of cementing longitudinal strips of celluloid of different colors into plates or blocks, cutting transversely from said plates or blocks narrow strips or plates, cementing said narrow strips or plates together into a suitable design, cementing said design to the blank of the article to be ornamented, and lastly molding the blank thus ornamented into shape by heat, substantially as set forth.

3. An article of celluloid, the body of which is provided with ornamental strips or bands formed of differently-colored pieces of celluloid cemented together, substantially as set forth.

699,517. LOCOMOTIVE WITH DRIVEN ROCKER. CHRISTIAN KAHLEN, Brieg, Germany. Filed Sept. 20, 1900. Serial No. 51,394. (No model.)

Claim.—1. In a locomotive, a bogie at the front of the cylinders thereof, a fixed truck provided with coupled axles at the rear of the cylinders, a connecting-rod for operating said coupled axles, a lever connected to said rod for operating the same, a lever connected with said bogie, and means connecting said levers together for operating said bogie.

2. In a locomotive of the character described, a pivoted frame or truck, a coupled axle supported thereby and consisting of a hollow axle forming a coupling-ring, a pair of half crank-axles mounted in said hollow axle and journaled in the main frame of the locomotive, and a universal coupling seated in said hollow axle and engaging the inner end of said half crank-axles.

3. In a locomotive of the character described, a pivoted frame or truck, a coupled axle supported thereby and consisting of a hollow axle having its inner flange formed with bearing-surfaces and forming a coupling-ring, a pair of half crank-axles mounted in said hollow axle, journaled in the main frame of the locomotive and provided with working flanges engaging the bearing-surfaces of the hollow axle, bearing-bushings provided on the inner end of said half crank-axles, and a sphere mounted between the said bushings.

4. In a locomotive of the character described, a pivoted frame or truck, a coupled axle supported thereby and consisting of a hollow axle provided with bearing-surfaces and forming a coupling-ring, a pair of half crank-axles mounted in said hollow axle and journaled in the main frame of the locomotive, an articulated connection between the said half crank-axles and provided with working flanges engaging the bearing-surfaces of the said hollow axle, bearing-bushings on the inner end of said half crank-axles, and a sphere mounted between the said bearing-bushings.

5. In a locomotive engine, an adjustable resistance for the displacement of the bogie consisting of means interposed between the main frame of the engine and the bogie for causing friction, pivoted levers engaging with the said means and operated by the movement of the frame for operating the said means, said means attached to the levers for connecting them together.

6. In a locomotive of the character described, an adjustable resistance for the displacement of the bogie, comprising slide-blocks, rollers connected thereto, and means for connecting the rollers to the slide-blocks.

7. In a locomotive of the character described, an adjustable resistance for the displacement of the bogie, comprising slide-blocks, rollers connected thereto, means for connecting the rollers to the blocks, and levers for operating the blocks upon the movement of the bogie.

8. In a locomotive of the character described, a bogie provided with pivoted axles, a truck provided with adjustable axles, bars for connecting the pivoted to the adjustable axles, means facilitating on fixed pivots suitably connected to said bars, pins attached to said bars, and bars attached in the axle-bearings and to said pins.

9. In a locomotive of the character described, a bogie provided with pivoted axles, a truck provided with adjustable axles, bars for connecting the pivoted to the adjustable axles, means facilitating on fixed pivots suitably connected to said bars, pins attached to said bars, and bars attached to the axle-bearings and to said pins, and spring-arms suitably arranged in relation to the said equalizing-beams for the purpose of giving a complete initial tension and facilitating an adjustment of one axle to the curve, while the other axle is still located on the straight part of the line.

699,518. TACKLE-BLOCK. EDGAR E. HARRISON, New Bedford, Mass. Filed Feb. 10, 1902. Serial No. 93,377. (No model.)

Claim.—1. A tackle-block comprising the sheave, the sheave having bearings in the sheave, the lining-plates connected to the sheave, and

the check-plates connected by bolts fastening to the lining-plates and having unbroken outer surfaces.

2. A tackle-block comprising a pair of sheaves, a sheave having bearings in the sheave, lining-plates connected to the sheave, marginal flanges about the lining-plates, and check-plates having unbroken outer surfaces, said check-plates fitting within the marginal flanges and being connected to the lining-plates by screws inserted from the inner surface thereof.

3. A tackle-block comprising sheaves, sheave having outwardly-projecting bearings for the sheave, lining-plates connected to the sheave, and check-plates upon the outer surface of the lining-plates, said check-plates having unbroken outer surfaces and having recesses to receive the sheave-bearings and pads of lubricating material in said recesses.

4. A tackle-block comprising sheaves having inwardly-projecting bearings, 3, 4, connected by screws 5, 6, a sheave mounted in bearings in said sheave, lining-plates connected to the sheave, and check-plates connected to the lining-plates by bolts fastening, said check-plates having unbroken outer surfaces.

699,519. BUTTERFLY HOOK. HENRY L. HAMM, Oakland, Cal. Filed Nov. 11, 1901. Serial No. 81,992. (No model.)

Claim.—1. In a detachable hook for boats and shores a metallic hook-plate attached to the hook-end of the shank; holes in said plate to receive the heads of screws or pins; a multiple-armed hook attached centrally to the plate on a swivel center; a lever-arm connected with the hook and adapted to project beyond the edge of the hook; a depression in the upper face of the hook adapted to receive the multiple-armed hook and its lever arm and screws or pins having heads projecting from the upper face of the hook and adapted to enter the holes in the hook-plate and to be locked in position by bolts on the ends of the arms of the multiple-armed hook substantially as described.

2. In a detachable hook for boats and shores a multiple-armed hook attached by a swivel center to the hook-end of the shank or shank; hooks at the ends of the arms; a lever projecting from the multiple-armed hook and projecting beyond the edge of the hook; a hook proper having a depression in its upper face corresponding with the multiple-armed plate and its lever; projecting headed screws or pins in the depression and adapted to be embraced by the hooks of the multiple-armed plate, substantially as described.

699,520. KNIFE AND THE ART OF MAKING SAME. HENRY G. HART, Utica, N. Y. Filed Jan. 20, 1902. Serial No. 81,000. (No model.)

Claim.—1. The art of making knives which consists in making the blade proper and handle of metal and in one piece, of making the rim or bolster separately and of a non-corrosive metal, and then joining the blade and rim, together, substantially as described.

2. The art of making knives which consists in making the blade proper and handle of steel and in one piece, of making the rim or bolster separately, and of a non-corrosive metal, and then joining the blade and rim together, substantially as described.

3. The art of making knives, which consists of making the blade proper of metal which has formed therein a rim-end, and then joining a non-corrosive rim in the end, substantially as described.

4. The art of making knives which consists in making the blade proper, having a seat for a rim, a non-corrosive rim placed in the seat, and then joining the rim and drawing and shaping said rim, substantially as described.

5. As an article of manufacture, a knife proper and handle made of metal and in one piece, a separate and non-corrosive rim or bolster, and a plating covering the blade and rim, substantially as described.

6. As an article of manufacture, a knife proper and handle made of metal having a groove, and a separate and non-corrosive rim or bolster overlaid in the groove, substantially as described.

7. As an article of manufacture, a knife proper and handle made of metal having a groove, a separate and endless non-corrosive rim or bolster overlaid in the groove, and a plating covering the knife and rim, substantially as described.

8. As an article of manufacture, a steel knife and handle made in one piece and having a groove formed therein, a separate and non-corrosive rim or bolster overlaid in said groove, and a plating covering the knife and rim, substantially as described.

9. A knife and handle made in a single piece and being formed with an endless groove, a separate non-corrosive rim overlaid into the groove, and a plating covering the knife and rim, substantially as described.

699,521. CHURCH. Otto Hermann, Stuttgart, Germany. Filed Jan. 13, 1901. Serial No. 42,942. (No model.)

Claim.—1. The combination of the vessel having a neck, a blade or heater pivoted to oscillate in said vessel and extending through the neck thereof, and a flexible member arranged at the neck and engaging the heater-clip.

2. The combination of the vessel having a neck and a curved bottom, a blade or heater pivoted about an axis extending approximately through the center of curvature of the bottom, said heater having its stem extended through the neck of the vessel, a support for the vessel, a cap for the vessel, a washer or cushion interposed between the cap and the vessel and having a flexible member or sleeve engaging the heater-clip, and means connecting the support with the cap.

699,522. FLASH-LIGHT APPARATUS. ALFRED H. HENLEY, Leesport, Pa. Filed July 26, 1901. Serial No. 69,042. (No model.)

Claim.—In a flash-light apparatus, a block provided with a receptacle for the powder, two metallic arms pivotally attached to said block and each having a split end extending over the receptacle, a resistance inserted in said split ends to bridge the same, and said arms having a projecting free end extending above the face of the block to receive the terminals of an electric circuit, all arranged so that variations in the bridging resistance may be obtained either by removing and replacing the resistance in the split ends of said arms or by turning the arms on their pivotal supports.

699,523. TRUNK AND DISPLAY CASE. CHRISTIAN EDWARDS, St. Joseph, Mo. Filed Mar. 14, 1902. Serial No. 57,562. (No model.)

Claim.—1. The combination with a trunk comprising a body, the interior of which is gradually tapered in transverse width from its bottom to its top, and a suitable cover, of cover removably arranged side by side in the body and projecting above the top of the same.

2. In a tray for holding and displaying shirts and the like, the combination of a frame having a suitable back, one or more bars disposed in the frame, and shirt-holding means arranged to be held in adjustable engagement with said bar or bars by shirts arranged below said means.

3. In a case for holding and displaying articles; the combination of sections hinged together, a stay connected to one section, means on the same section for coacting with the stay to hold the sections together or closed; and means on the other section for coacting with the stay to hold the sections open or apart.

4. In a case for holding and displaying articles, the combination of sections hinged together, a stay connected to one section, means on the same section for coacting with the stay to hold the sections together or closed, means on the other section for coacting with the stay to hold the sections at an angle to each other, and means on said other section for coacting with the stay to hold the sections in alignment with each other.

5. In a case for holding and displaying articles, the combination of sections hinged together, a stay pivotally connected to one section, and having a slot and an offset leading therefrom, and also having a beveled portion, a keeper on the same section arranged to engage the stay and hold the sections closed, a pin on the other section arranged in the slot and adapted to rest in the offset of the stay, and a stud also on said other section and adapted to pass the beveled portion of the stay and enter the slot thereof for the purpose described.

6. In a tray for holding and displaying shirts and the like, the combination of a frame having a suitable back, one or more longitudinal bars disposed in the frame and having notches, and shirt-holding means engaging notches in the bar and adapted to be held in engagement with said notches by shirts arranged below said means.

7. In a tray for holding shirts and the like, the combination of a frame having a yielding back, a bar disposed in the frame and having notches in its edge adjacent to the yielding back, and shirt-holding means removably arranged in notches of the bar and adjustable between said bar and the yielding back.

8. In a tray for holding shirts and the like, the combination of a frame having a yielding back, a bar disposed in the frame and having notches in its edge adjacent to the yielding back, rings surrounding the bar and removably seated in notches thereof, and a cord stretched between opposite bars of the frame and extending through the rings.

9. The combination in a tray, of a frame having a suitable back, a bar disposed in the frame, rings surrounding the bar and adjustably held thereby, and a cord stretched between opposite bars of the frame and extending through the rings.

10. In a case for holding and displaying shirts and other articles, the combination of two trays hinged together and having backs, notched bars, rings surrounding the bars and seated in notches thereof, and cords extending through the rings, and a stay connected to the trays for holding the same in proper relative position.

699,524. LETTER OR SPACE INDICATING SCALE FOR TYPE-SETTING MACHINES. CHRISTIAN R. HALL, Newark, N. J., assignor to the Whitehead & Hall Company, Newark, N. J., a Corporation of New Jersey. Filed Oct. 24, 1901. Serial No. 52,224. (No model.)

Claim.—1. An index-plate comprising a pad or filling, a back plate having a coated surface provided with graduations, a transparent facing in contact with the graduated surface and separate therefrom and means for impinging the edges of said layers one against the other for holding them in fixed relation.

2. An index-plate comprising a metallic strip, a pad or filling in contact with the metal, a back plate having a graduated surface, and a transparent facing in contact with and separate from the graduated surface, the longitudinal edges of the metal strip being clamped over and upon the longitudinal edges of the transparent facing for holding the parts in fixed relation.

prevent facing in contact with and separate from the graduated surface, the longitudinal edges of the metal strip being clamped over and upon the longitudinal edges of the transparent facing for holding the parts in fixed relation.

699,525. FURNACE-CHARGING SYSTEM. ARTHUR W. HODGE, Grand Forks, Canada. Filed June 7, 1901. Serial No. 62,961. (No model.)

Claim.—1. A furnace-charging system comprising in combination with the furnace, a charge-carrier having a charging area the size and shape of the area of the furnace, means for moving the charge-carrier, and charge-distributing means comprising a charging aperture or apertures the size and shape of the area of the charge-carrier.

2. A furnace-charging system comprising in combination with the furnace, a charge-carrier having a plurality of compartments, the combined dumping area of which approximately equals the cross-sectional area of the furnace, means for moving the carrier, and charge-distributing means comprising a ladder above the carrier when in a position to be charged, said charge-distributing means being constructed to effect a distribution of the charge in the carrier in conformity with the position to be occupied thereby in the furnace.

3. A furnace-charging system comprising, in combination with the furnace, a charge-carrier having a charging area the size and shape of the area of the furnace, means for moving the carrier, and means, disposed within the vertical plane of both sides of the carrier when in position to be charged, for effecting a charging of the carrier in conformity with a predetermined position to be occupied by the charge in the furnace.

4. A furnace-charging system comprising in combination with a furnace, a charge-carrier having a charging area the size and shape of the area of the furnace, means for moving the carrier, a charging-pit for the empty carrier, and charge-distributing means arranged above the pit and comprehending a charging aperture or apertures the size and shape of the area of the charge-carrier.

5. In a furnace-charging system, the main feed-door, the furnace-opening through the said door, a truck arranged on the floor and extending across the furnace, a car-charging pit into which said truck extends, an auxiliary feed-door section constituting the roof of said pit and having elongated filling or distributing holes, a traveling charge-carrier rolling on the truck and having several compartments corresponding to said filling or distributing holes, and opening means for moving said carrier over the truck.

699,526. SIGNAL-LASTING. EDWARD R. BROWN, Colorado Springs, Colo. Filed Jan. 10, 1902. Serial No. 63,178. (No model.)

Claim.—1. In a device of the class described, the combination of a base having a reservoir and provided within the area of the same at the periphery thereof with a vertical channel having a contracted slot communicating with the exterior of the reservoir and forming an entrance to the channel throughout the length of the same, a vertically-movable globe-support provided with a nut arranged within the channel of the base, and a screw mounted on the base and engaging the nut and adapted to be rotated to raise and lower the support, substantially as described.

2. In a device of the class described, the combination of a base provided with a reservoir and having a channel or groove located within the area or contour of the reservoir at the periphery thereof and provided therewith with a contracted slot forming a peripheral entrance throughout the length of the groove or channel, a vertically-movable support provided with a nut adapted to receive a supplemental globe, said support being also provided with a nut arranged in the channel or groove, a catch mounted on the support for engaging the upper edge of a globe, and a screw mounted on the base and arranged within the groove or channel and engaging the nut, said screw being provided at the bottom of the reservoir with an exterior head, substantially as described.

3. In a device of the class described, the combination of a base having a reservoir and provided at one side thereof with a vertical groove or channel and having a peripheral entrance to the said groove or channel throughout the entire length of the same, a support having a nut slidably arranged in the groove or channel, a rod extending upward from the support and provided with a head arranged to engage the upper edge of a globe, and a screw mounted on the base and arranged in the groove or channel and engaging said nut, substantially as described.

4. In a device of the class described, the combination of a base provided at one side with a vertical groove or channel and having a contracted slot forming a peripheral entrance to the groove or channel throughout the length of the same, a support having a nut for a supplemental globe and provided with a nut slidably arranged within the groove or channel, a screw mounted on the base and arranged within the groove or channel and engaging the nut, said screw being provided with an exterior head, a catch for holding the globe on the support, and the vertical wires secured to the exterior of the reservoir and forming guides for the globe and opening the same from the reservoir, substantially as described.

699,527. GLOBE-SIGNAL-FIRE SIGNAL. EDWARD R. BROWN, Colorado Springs, Colo., assignor to the Brown Brothers and Manufacturing Company, Grand Forks, Canada. Filed Feb. 17, 1902. Serial No. 64,022. (No model.)

Claim.—1. In a sheet-metal-pipe crimper, a shaft, a series of double cranks on said shaft, a head located in concentric line with said shaft, a series of radially-movable dies located around said head, and a series of links severally pivotally connected at one end with the respective cranks and at the other end with the respective dies, the double cranks and links being arranged to move the dies simultaneously toward and then simultaneously from the head.

2. In a sheet-metal-pipe crimper, a shaft, a series of double cranks on said shaft, a series of radially-movable dies located around the line of the center of said shaft, and a series of links severally pivotally connected at one end with the respective cranks and at the other end with the respective dies, the double cranks being arranged to move the dies simultaneously toward and then simultaneously from said center line.

3. In a sheet-metal-pipe crimper, a head, longitudinal converging inclined channels in said head, ridge-pieces movable endwise in said channels, and springs acting to keep said ridge-pieces in their normal expanded position.

4. In a sheet-metal-pipe crimper, a head, longitudinal converging channels in said head, there being steep inclined parts in the bottoms of said channels near the larger end of said head, ridge-pieces movable endwise in said channels, and springs acting to keep said ridge-pieces in their normal expanded position.

699,528. HEATING-FURNACE FOR COILED BUNDLES. AMOS R. HUNT and WILLIAM ADLER, Duquesne, Pa. Filed Jan. 24, 1900. Serial No. 91,611. (No model.)

Claim.—1. A continuous heating-furnace comprising a movable carrier, a set of revolvable bundle-supports mounted on the carrier, and a furnace-chamber through which the bundles pass; substantially as described.

2. A furnace-chamber having an endless carrier forming its bottom, means for moving the carrier, and a series of revolvable bundle-supports mounted on the carrier-bottom; substantially as described.

3. A bundle-heating furnace of circular form, having a rotary bottom, and a coating water-trough, bundle-supports revolvably mounted on said bottom and flange forming an air seal around the furnace; substantially as described.

4. A continuous heating-furnace for bundles, having an annular heating-chamber, a rotary bottom carrying revolvable bundle-carriers, and a partition extending transversely of the furnace chamber and arranged to prevent short-circuiting of the gases; substantially as described.

5. A heating-furnace having a fuel-inlet and gaseous outlet, and a rotary bottom, revolvable bundle-carriers mounted on said bottom, a radially-extending partition between the fuel-inlet and the outlet for gases, and a door in said partition arranged to be actuated by the bundle-carriers; substantially as described.

6. A continuous heating-furnace having an annular furnace-chamber of smaller cross-sectional area in its inner portion than in its outer portion; substantially as described.

7. A continuous heating-furnace having an annular chamber with a rotary bottom, arranged to involve coils, and a roof which is inclined inwardly to contract the cross-sectional area of the inner part of the chamber; substantially as described.

8. A heating-furnace comprising a movable carrier, a set of revolvable bundle-supports mounted on the carrier, and a furnace-chamber through which the bundles pass, said chamber having an opening through which a heated bundle may be inserted and drawn; substantially as described.

699,529. BUT-CRACKER. JOHN A. HUTCHINSON, Chicago, Ill. Assignor of two-thirds to John R. Hutchinson and Charles A. Yates. Filed July 22, 1900. Serial No. 94,561. (No model.)

Claim.—1. In a nut-cracker, the combination of a frame having a fixed jaw, a vertically-moving plunger carrying a jaw, collars surrounding said plunger, said collars having their bases at an angle to the plane of the plunger, means for normally holding the collars out of frictional engagement with the plunger upon the upward movement of the latter, and levers for raising the plunger, substantially as set forth.

2. In a nut-cracker, the combination of a frame having a fixed jaw, a vertically-moving and spring-supported plunger carrying a jaw, collars surrounding said plunger, said collars having their bases at an angle to the plane of the plunger, a sleeve normally holding the collars out of engagement with the plunger upon the upward movement of the latter, a collar engaging said sleeve, and levers adapted to raise said collar and plunger, substantially in the manner and for the purpose set forth.

3. In a nut-cracker, the combination of a frame having a fixed jaw, a vertically-moving and spring-supported plunger carrying a jaw, collars surrounding said plunger, said collars having their bases at an angle to the plane of the plunger and provided with lateral legs, a sleeve surrounding said collars and having openings engaging said legs, a collar surrounding said sleeve and adapted to engage same, and levers for raising said plunger and collar, as set forth.

699,530. DETACHABLE FASTENER FOR HINGES. BENJAMIN H. JAMES, Chicago, Ill. Filed Jan. 22, 1901. Serial No. 46,664. (No model.)

Claim.—1. A fastener for hinges consisting of a plate having upwardly-converging grooved flanges formed on the front of its body and a hinge-leaf having in its body an upwardly-tapered longitudinal slot opening at its base near to the bottom of the leaf with its side in the same plane as the body of the leaf, substantially as described.

2. A detachable fastener for hinges consisting of a plate having upwardly-converging flanges formed outwardly from its body, each flange having on its outer face a recess or groove and a hinge provided with two companion base-plates, each leaf having in its body an upwardly-tapered longitudinal slot opening at its base to the bottom of the leaf and each leaf having at the base of the slot a raised end bar extending over the slot substantially as described.

699,531. ALARM. MAXIMILIAN P. JAMES, Muskegon, Mich. Filed Jan. 2, 1900. Serial No. 95,125. (No model.)

Claim.—1. An automatic alarm-controller and a carrier with which it has retractable engagement adjustable to be in or out of the opening path of a door, and a latch automatically engageable with said controller on retraction of the same by door-pressure thereon.

2. An automatic alarm-controller and a pivotally-adjustable flexibly-jointed carrier with which it has retractable engagement, and a latch automatically engageable with the controller to hold the same in retracted position subsequent to pressure thereon when said carrier is arranged and adjusted in connection with a support to be in the opening path of a door.

3. An automatic alarm-controller and carrier for same adjustable in connection with a support to be in or out of the opening path of a door, and an independent spring-controlled push-button arranged in connection with the door-frame to have its shaft engage said controller when the same with its carrier is adjusted out of said opening path of the door.

4. A door-frame fixture having an annular flange and radial legs, an arm having a flange lapping the fixture-flange and provided with a fin having play between fixture-legs, a pivot extending through the arm and fixture, a spiral spring surrounding the pivot under compression, between said arm and fixture, a spring-motor adjustable with the abovedescribed arm, a gear-bell in connection with the main-spring-arbor of the motor, a bell-crank having shaft connection with the pivot-axis of said motor, and a spring-controlled push-stem having a collar arranged to be normally under the bell-crank shaft to check operation of the abovedescribed motor.

5. A door-frame fixture having an annular flange and radial legs, an arm having a flange lapping the fixture-flange and provided with a fin having play between fixture-legs, a pivot extending through the arm and fixture, a spiral spring surrounding the pivot under compression between said arm and fixture, a spring-motor adjustable with the abovedescribed arm, a gear-bell in connection with the main-spring-arbor of the motor, a bell-crank having shaft connection with the pivot-axis of the motor, a spring-controlled push-stem having a collar arranged to be normally under the bell-crank shaft to check operation of said motor, and a gravity-latch automatically adjustable to be engageable with the push-stem when the latter is retracted by pressure of a door subsequent to having been brought in the opening path of same.

6. A door-frame fixture, a flexibly-jointed carrier in pivotally-adjustable connection with the fixture, automatic alarm mechanism in connection with the carrier, and an alarm-controller in the form of a push-stem arranged to be brought with said carrier in the opening path of a door.

7. A door-frame fixture, a flexibly-jointed carrier in pivotally-adjustable connection with the fixture, automatic alarm mechanism in connection with the carrier, an alarm-controller in the form of a push-stem arranged to be brought with said carrier into the opening path of a door, and means for holding said push-stem in retracted position subsequent to door-pressure thereon.

8. A carrier for adjustable connection with a door-frame automatic alarm mechanism in connection with the carrier, an alarm-controller in the form of a push-stem arranged to be brought with said carrier into the opening path of a door, and a spring-controlled push-button for connection with the door-frame to have its shaft in register with said push-stem when the latter and the abovedescribed carrier are adjusted out of the way of the door.

699,532. SAFETY-VALVE. WILLIAM E. JEROME, Watkiss, Mass. Assignor to the American Steam Gauge Company, Boston, Mass., a Corporation. Filed Sept. 22, 1900. Serial No. 73,982. (No model.)

Claim.—In a safety-valve, the combination with a valve-spindle lever, of a hand-lever pivotally secured to the casing, a link connecting the valve-lever and the hand-lever, and an abutment to act as a stop to limit the movement of the link, the parts being so arranged that when

the hand-lever is moved to operate the valve-lever the link will automatically maintain the valve-lever in its changed position.

699,533. SEMI-METAL-BRATING FURNACE. JOHN E. JOHNS and WILLIAM JOHN, Howard, Ind. Filed June 24, 1901. Serial No. 46,557. (No model.)

Claim.—1. In a heater of the character described, the combination of the heating-chambers arranged side by side, a transverse heating-chamber establishing communication between said first-named heating-chambers, conveyors for conveying the material to be heated through the several heating-chambers, and actuating means common to all the conveyors for operating them, substantially as set forth.

2. In a heater of the character described, the combination of the heating-chambers arranged side by side, one having an entrance and the other an exit at their forward ends, a transverse heating-chamber establishing communication between the rear ends of the first-named heating-chambers, conveyors for conveying the material to be heated through the several heating-chambers, and actuating means common to all the conveyors for operating them, substantially as set forth.

3. In a heater of the character described, the combination of the heating-chambers arranged side by side, the transverse heating-chamber establishing communication between said first-named heating-chambers, conveyors for the respective heating-chambers, means for actuating the conveyors in the first-named chamber in unison to project their rear ends into and withdraw them from the transverse chamber, and means for operating the transverse conveyor to reciprocate the same in alternation with the longitudinal conveyors, substantially as set forth.

4. In a heater of the character described, the combination with the longitudinal chambers, of a transverse chamber establishing communication between the rear ends of the longitudinal chambers, said chambers being provided with grooved flanges and the grooves of the transverse chamber being interlocked by those of the longitudinal chambers, con-

veyers for said chambers, means for raising the conveyers in the longitudinal chambers across the grooves of the transverse chamber, and means for moving the transverse conveyer in alternation with the longitudinal conveyers, substantially as set forth.

5. In a heater of the character described, the combination with a heating-chamber having an exit, and a door for closing the exit, of a reciprocating ejector, a conveyor for moving the heated material upon said ejector, means for opening the door, and simultaneously operating the ejector to thrust it forwardly, substantially as set forth.

6. In a heater of the character described, the combination with the heating-chamber provided with an exit, a door for closing the exit, a conveyor having a movement through the exit, an ejector adapted to be engaged by the conveyor and moved rearwardly under the edge of the door, means for elevating said door, and means for returning said ejector to its normal position, substantially as set forth.

7. In a heater of the character described, the combination with the longitudinal heating-chambers and the transverse heating-chamber establishing communication between the longitudinal chambers at the rear ends thereof, of conveyers located within said chambers, the forward ends of said longitudinal chambers being provided one with an entrance and the other an exit and doors for closing the entrance and exit, and means for opening and closing the entrance and exit doors for the entrance into one of the longitudinal heating-chambers, of material to be heated, and the removal from the other longitudinal heating-chamber, of the properly heated material, substantially as set forth.

8. In a heater of the character described, the combination with the longitudinal heating-chambers and the transverse heating-chamber establishing communication between the rear ends of the longitudinal chambers, said chambers having slots in their floors of conveyers projecting upwardly through the slots in the floors of the several chambers, means for elevating the conveyers of the longitudinal chambers in alternation, advance and retract for reciprocating the longitudinal conveyers in union, one in its depressed position and the other in its elevated position, means for elevating the transverse conveyer, and advance and retract for reciprocating the transverse conveyer in alternation with the reciprocating movement of the longitudinal conveyers, substantially as set forth.

699,534. MANUFACTURE OF BRICKS, TILES, OR THE LIKE. ARTHUR J. KEMMEL, Peterborough, England. Filed Aug. 17, 1901. Serial No. 72,441. (No model.)

Claim.—1. The process of manufacturing bricks, tiles and the like, by first shaping the article, then coating it with a solution of colloid, such as glue animal albumen, gelatin, isinglass or equivalent heretofore mentioned and subsequently drying and firing the same.

2. The process of manufacturing bricks, tiles and the like, by first shaping the article, then partially coating it with a solution of colloid such as glue, animal albumen, gelatin, isinglass or equivalent heretofore mentioned, and subsequently drying and firing the same.

3. The process of manufacturing bricks, tiles and the like by applying to the surface thereof a solution of colloid, such as glue, animal albumen, gelatin, isinglass or equivalent heretofore mentioned, previous to drying and firing the same.

4. The process of treating earthen articles before drying and burning, which consists in coating the same with an animal colloid solution prepared from glue, animal albumen, gelatin, isinglass or the like, substantially as set forth.

699,535. DRILLING-MACHINE. EDWARD F. KELLEY, Patented U. S. Filed July 25, 1901. Serial No. 69,002. (No model.)

Claim.—1. The combination with the standard or support of a drilling-machine, a yoke or bracket adjustable thereon and a rotary spindle mounted in said bracket, of means for connecting up various interchangeable tools with said spindle, a support on said yoke or bracket for various interchangeable cooperating devices for said tools, and coupling devices for connecting said cooperating devices to said support.

2. The combination with the standard or support of a drilling-machine, a yoke or bracket adjustable thereon and a rotary spindle mounted in said bracket, of means for connecting up various interchangeable tools with said spindle, a supporting-rod secured to said yoke or bracket for uniting various interchangeable cooperating devices for said tools, and coupling devices for connecting said cooperating devices to said rod.

3. The combination with the standard or support of a drilling-machine, a yoke or bracket adjustable thereon and provided with a lag, and a rotary spindle mounted in said bracket, of means for connecting up various interchangeable tools with said spindle, a supporting-rod removably secured in said lag, and means for connecting up various cooperating devices for said tools to said supporting-rod.

4. The combination with the frame of a drilling-machine having a lag thereon, and a rotary spindle having screw-threads thereon for the

attachment of a drill-check and a shoulder adjacent to said screw-threads, of a grinding-wheel having a central opening therein designed to receive the screw-threads and of said spindle, a nut for holding said grinding-wheel into locking engagement with said shoulder, a supporting-rod secured in said lag, and a tool-rod adjustably secured to said supporting-rod.

699,536. BRACK. HARRY A. KNEE, Springfield, Mass. Filed Dec. 21, 1901. Serial No. 96,797. (No model.)

Claim.—A rotatable axle, a cup-shaped body secured thereon, a bearing for said axle, a split ring in said body for frictional contact with the inner surface of the peripheral wall of said body, one end of said ring having a solid web forming part thereof, whereby it is made practically rigid, an arm between said web and said bearing for supporting said ring; a screw-threaded stud between the ends of said ring, and means for rotating said stud to force the free end of said ring away from said rigid end thereof to bring the ring into frictional contact with the peripheral wall of said body.

699,537. BUILDING STONE OR BRICK. JOHN W. LAMMIE, Indianapolis, Ind. Filed Feb. 27, 1902. Serial No. 95,944. (No model.)

Claim.—1. A building stone or brick having a longitudinal groove in its bottom extending from end to end thereof, a longitudinal rib upon its top extending from end to end thereof, a horizontally-disposed groove in one end extending from the inner side nearly to the outer side or face thereof, and a rib projecting from the opposite end and extending from the inner side nearly to the outer side or face thereof, whereby the blocks are rendered self-aligning and self-leveling when laid upon a level and aligned bottom layer.

2. A building corner stone or brick having a longitudinal and a transverse groove in its bottom, and a longitudinal and a transverse rib upon its top integral therewith extending from one end nearly to the opposite end thereof and thence to the inner side thereof; a horizontal transverse groove in one end extending from the inner side nearly to the outer side thereof, and a horizontal rib on the inner face near the opposite end thereof, substantially as set forth.

3. A building corner stone or brick having a longitudinal and a transverse groove in its bottom, and a longitudinal and a transverse rib on its top integral therewith extending from one end nearly to the opposite end thereof and thence to the inner side thereof; a horizontal transverse rib in one end extending from the inner side nearly to the outer side thereof, and a horizontal groove in the inner face near the opposite end thereof, substantially as set forth.

4. A wall formed of stones or bricks comprising line-blocks having each a longitudinal groove in the bottom thereof and a longitudinal rib on its top thereof, the grooves and the ribs extending from end to end of the blocks, said blocks each having also a horizontal groove in one end thereof extending from the inner side nearly to the outer side thereof, and a horizontal rib on the opposite end thereof extending from the inner side nearly to the outer side thereof; corner-blocks each having longitudinal and transverse grooves in the bottom and longitudinal and transverse ribs on the top thereof, and also a horizontal groove in one end thereof and a horizontal rib on the inner side near the opposite end thereof, registering with the grooves and the ribs of the line-blocks; and corner-blocks having each longitudinal and transverse grooves in the bottom and longitudinal and transverse ribs on the top thereof, and also a horizontal rib on one end thereof and a horizontal groove in the inner side near the opposite end thereof, registering with the grooves and the ribs of the line-blocks, substantially as set forth.

699,538. BELT-PARTNER FOR CONSTRUCTING RIMS OF DRIVE-ROLLERS. EMMY F. LARAVA, Worcester, Mass. Filed Sept. 2, 1901. Serial No. 74,124. (No model.)

Claim.—A belt-partner for constructing the ends of drive-belts comprising a plate having slotted integral extended ends adapted to be bent to form tubular rivets on the upper terminal ends of said plate, the upward-extending ends when bent forming ribs opposite the ribs in the integral extended ends, and a plate with eyes consisting with said rivets, substantially as specified.

699,539. CAR-TRUCKING MACHINE. BLAKE J. LEWIS, New York, N. Y. Filed May 22, 1901. Serial No. 61,002. (No model.)

Claim.—1. In a machine for testing cars, the combination with the main shaft provided with one-carrying device of the character described, of an operating-arm secured on said shaft, and mechanism for intermittently operating the arm to rock the shaft.

2. In a machine for testing cars, the combination with the main shaft provided with one-carrying device, of an operating-arm secured on said shaft, a perforated steel adjustably secured on the arm, a supporting-rod adjustably mounted in the end and provided with adjustable stops, and means for operating the rod to rock the operating-arm and thereby the shaft.

3. In a car-testing machine, the combination with the main shaft provided with one-carrying device, of an operating-arm secured on said shaft, a perforated steel adjustably secured on the arm, a connecting-rod having one end operating in the perforated steel and the other end pivotally connected to a crank-arm secured on a gear-wheel, the gear-wheel, and mechanism for driving said gear-wheel.

699,540. SLEDGE. FREDERICK F. LEWIS, Hastings, Mass. Filed Jan. 21, 1902. Serial No. 95,099. (No model.)

Claim.—1. In a sledge, the combination with a bearing-block, arranged to be rigidly secured to the beam of a sledge and having a flat seat in its under face, of a knee provided with a head rotatably mounted in the seat, and a vertical pivot securing the head and bearing-block together, said knee having a horizontal pivotal movement upon said bearing-block.

2. In a sledge, the combination with a beam, of a bearing-block fastened to the under side of the beam against relative movement thereon, said bearing-block having a seat in its under face, a runner, a knee comprising pivotally-connected sections, the lower section being secured to the runner and the upper section fitting in the seat of the bearing-block, and a vertically-arranged pivot connecting the upper knee-section and the bearing-block.

3. In a sledge, the combination of a beam with a runner, of a bearing-block fixedly secured to the under side of the beam and having a flat seat in its under face, and a knee comprising pivotally-connected sections, the lower of which is secured to the runner, the upper section being secured in the seat of the bearing-block and having a horizontal pivotal movement therein.

4. In a sledge, the combination with a beam, of a bearing-block fastened to the under side of the beam against relative movement thereon and having a seat in its under face, a runner, a knee comprising sections having a horizontal pivotal connection, the lower knee-section being secured to the runner and the upper section having an outstanding plate at its upper end and that is fitted in the seat of the bearing-block, and a vertical pivot-rod passing through the bearing plate and block to secure them together, and yet permit the pivotal movement of the knee.

5. In a sledge, the combination with a bearing-block arranged to be fixedly secured to a sledge-beam and having a seat in its under face, of a

runner, and a brace connecting the runner and bearing-block, said brace comprising pivotally-connected sections, the upper of which is provided with a head that bears in the seat of the block, and a vertical pivot passing through the head and the block.

699,541. PROCESS OF MAKING PRESERVATIVES FOR VEGETABLES. FRED LUTZ, Hamburg, Germany. Filed Sept. 9, 1901. Serial No. 74,888. (No specimens.)

Claim.—A process for manufacturing a preservative for gel strings consisting in dissolving paraffin-oil in a mixture of benzene and camphor-spirit.

699,542. RAILWAY BLOCK SYSTEM. JOHN S. MATHES, Greenville, Pa. Filed Jan. 12, 1902. Serial No. 32,404. (No model.)

Claim.—1. In a railway block system, a block-station having at least one siding, a derail in the siding, and semaphore-signals for the siding and main track; substantially as described.

2. In a railway block system, a block-station having a siding, a derail near the clearance of the siding, and provided with a signal, and semaphore-signals upon opposite sides of the track at the entrance end of the siding; substantially as described.

3. In a railway block system, a block-station having an operating-tower, a siding having a derail with a signal, semaphore-signals for the main track and siding, and connections leading from the switches, derails and signals to the tower; substantially as described.

4. In a railway block system, a block-station having at least one siding, two derails located in the tracks adjacent to the station and having signals, semaphore-signals for the main track and siding, and connections leading from the switches derails and signals to the block-station tower; substantially as described.

5. In a railway block system, a block-station having two lap-sidings, a derail in each siding provided with a signal, and semaphore-signals for the sidings and main track; substantially as described.

6. In a railway block system, a block-station having an operating-tower, two lap-sidings, a derail on each siding, semaphore-signals for the sidings and main track, and mechanism in the tower for operating the switches, derails and signals; substantially as described.

699,543. MOTOR-VEHICLE. ERHAN P. MAKIN, Hartford, Conn., assignor, by mesne assignments, to Electric Vehicle Company, Jersey City, N. J., and New York, N. Y., a Corporation of New Jersey. Filed June 3, 1902. Renewed Aug. 12, 1902. Serial No. 737,708. (No model.)

Claim.—1. In a motor-vehicle, the combination with a running-gear frame comprising side bars and front and rear cross-bars, of springs secured to said side bars, a carriage-body supported upon said springs, a motor, transmitting-gearing, a motor-platform independent of said carriage-body, and springs independent of said front-mounted springs, secured in said side bars and supporting said motor-platform.

2. In a vehicle, the combination with the running-gear frame having a front cross-bar, of a front axle supported by the running-gear frame to swing about a horizontal axis, a yoke and a hub secured to the end of said cross-bar and the other to said axle, the hub having bearings in said yoke and braced secured to one of said parts having vertical bearing-surfaces for contact with the other of said parts to support the front axle, with freedom to swing in a vertical plane.

3. In a vehicle, the combination with the running-gear frame having a front cross-bar, and a front axle, of a yoke to which said front axle is secured, and a hub having front and rear bearings in the ends of said yoke, the front cross-bar being secured to said hub, whereby it may swing in a vertical plane.

4. In a vehicle, the combination with the running-gear frame having a front cross-bar, and a front axle, of a yoke to which said front axle is secured, a hub having front and rear bearings in the ends of said yoke, the front cross-bar being secured to said hub to swing in a vertical plane, and braced secured to said front cross-bar and having bearing-surfaces to support said front axle.

5. In a vehicle, the combination with the running-gear frame, the front axle, and wheels mounted to oscillate with respect to said axle, of a frame secured to said axle and supported by said running-gear frame, a short shaft supported by the frame secured to the axle, an arm secured to said shaft, a link extended from said arm to the bearing of the corresponding wheel, and mechanism to oscillate said shaft.

6. In a vehicle, the combination with the running-gear frame, the front axle, and wheels mounted to oscillate with respect to said axle, of a frame secured to said axle, a hub secured to said running-gear frame and having front and rear bearings in said frame secured to the axle, a vertical shaft having bearings in said last-named frame, an arm secured to said shaft, a link extended from said arm to the bearing of the corresponding wheel and means to oscillate said shaft.

7. In a vehicle, the combination with a carriage-body free to oscillate, a front axle, independent steering-wheels mounted thereon, a steering-frame connected with the wheel-supports, a steering-shaft mounted in bearings on the body, a gear on said shaft, a second gear on a horizontal axle in mesh with the first gear, an arm carried with the second gear, and connections from said arm to the steering-frame to transmit motion and permitting relative motion of said frame and body.

8. In a vehicle, the combination with the running-gear frame, a steering arm or lever carried with said running-gear frame, and a carriage-body free to oscillate, with respect to said running-gear frame, of a shaft connected with said steering-arm and means supported on the carriage-body to oscillate said shaft.

9. In a vehicle, the combination with the running-gear frame, a steering arm or lever carried with said running-gear frame, and a carriage-body free to oscillate with respect to said running-gear frame, of a shaft carried by said carriage-body, a ball-and-socket bearing for the rear

end of said shaft, a vertically-slotted bearing for the forward end of said shaft, an arm depending from said shaft to engage said steering-arm and means to oscillate said shaft.

10. In a vehicle, the combination with the running-gear frame, a steering arm or lever carried with said running-gear frame, and a carriage-body mounted on said running-gear frame, of a horizontal shaft supported in bearings on said carriage-body and having a depending arm connected with said steering-arm, a gear on said shaft and a vertical shaft having a gear to engage said first-named gear and bearing also a handle.

11. In a vehicle, the combination with a running-gear frame having a rear member and supports for the rear axle, a front axle, a horizontal axle for said axle supported by the running-gear frame, a body independent of the running-gear frame, and supported by springs thereon, the wheels, supports upon which said wheels are free to rotate, and a pivotal connection between each of said supports and the front axle, the axis of said pivotal connection being in rear of the axis of the wheel and lying in the plane of the wheel.

12. In a vehicle, the combination with the running-gear frame and wheels, of supports upon which said wheels are free to rotate, and a pivotal connection between each of said supports and the running-gear frame, the axis of said pivotal connection being inclined upwardly and rearwardly and lying in the plane of the wheel.

13. In a vehicle, the combination with the running-gear frame and wheels, of supports upon which said wheels are free to rotate, and a pivotal connection between each of said supports and the running-gear frame, the axis of said pivotal connection being in rear of the axis of the wheel and inclined upwardly and rearwardly and lying in the plane of the wheel.

14. In a vehicle, the combination with the running-gear frame and wheels, of supports upon which said wheels are free to rotate, and a pivotal connection between each of said supports and the running-gear frame, the axis of said pivotal connection lying in the plane of the wheel and being inclined upwardly and rearwardly.

15. In a vehicle, the combination with the running-gear frame having a rear member and supports for the rear axle, a front axle, a horizontal axle for said axle supported by the running-gear frame, a body independent of the running-gear frame and supported by springs thereon, and wheels, of supports upon which said wheels are free to rotate, and a pivotal connection between each of said supports and the front axle, the axis of said pivotal connection lying in the plane of the wheel and being in the rear of the axis of the wheel.

16. In a vehicle, the combination with the running-gear frame, of a hub mounted to oscillate with respect to said frame and formed with ball-bearings at its ends, the axis of oscillation being within the hub, a wheel mounted to rotate upon said hub with corresponding ball-bearings at its ends, and balls interposed between said bearings.

17. In a vehicle, the combination with the running-gear frame and a hub carried by said frame of a stud having a bearing in said hub, a hub carried by said stud to oscillate thereon and formed with ball-bearings at its ends, a wheel mounted to rotate upon said hub with corresponding ball-bearings, and balls interposed between said bearings.

18. In a vehicle, the combination with the front axle and a hub carried by said axle, of a stud having a bearing in said hub, a hub carried by said stud to oscillate thereon and formed with ball-bearings at its ends, a wheel mounted to rotate upon said hub with corresponding ball-bearings, balls interposed between said bearings, and a link connected to said hub to oscillate the same.

19. In a vehicle, the combination with the front axle and a hub carried by said axle, of a stud having a bearing in said hub, a hub carried by said stud to oscillate thereon, a wheel mounted to rotate upon said hub, a sleeve mounted to slide on said axle, and a link connecting said hub to said sleeve.

20. In a vehicle, the combination with an axle, of a tubular hub mounted to oscillate upon the end of said axle, a wheel-hub mounted upon said tubular hub, interposed antifriction-bearings, and a removable retaining-ring secured to one of said hubs.

21. In a vehicle, the combination with an axle, of a tubular hub mounted to oscillate upon the end of said axle, a wheel-hub mounted upon said tubular hub, and a retaining-ring secured to one of said hubs, said tubular hub having a projection at one side for connection of means for oscillating the same.

22. In a vehicle, the combination with an axle, of a tubular hub mounted to oscillate upon the end of said axle, a stud to secure the hub to the axle, and a wheel-hub mounted upon said tubular hub and having holes to permit the manipulation of said stud.

699,544. SAFETY-GATE FOR RAILWAY-CROSSING. JOHN W. WYATT, C. HENRY and WILLIAM A. HARRIS, Cincinnati, Ohio. Filed Feb. 1, 1902. Serial No. 51,004. (No model.)

Claim.—1. In a door-guard, a hinge attached to the door, a folding gate pivoted to the said hinge, and means for engaging the free end of the gate when extended.

2. In a door-guard, a hinge attached to a collar-door, a folding gate pivoted to said hinge, and a catch fixed to said collar-door adapted to engage the outer end of the gate when collapsed and folding inwardly against the door.

3. In combination with a two-leaved door, a long-tongue safety-gate hinged to the under side of one of the said leaves, and fastenings upon the other leaf to which the free ends of the long-tongue may be secured when the door is in its open position, substantially as described.

4. In combination with a two-leaved hatchway-door, a long-tongue gate hinged to the under side of one of the said leaves by means of a permanent hinge and an extensible hinge, and fastenings upon the other leaf to which the free ends of the long-tongue may be secured when the door is in its open position, substantially as described.

5. The herein-described safety-gate construction for hatchway-doors comprising the hinged door, A¹, A², long-tongue gate, A³, hinged to the door A¹, by means of the stationary hinge C and extensible hinged joint B, and opposite fastenings, as M, K, on the door A¹, for the free ends of the gate, substantially as described.

699,545. VENEER-CUTTING MACHINE. LOUIS S. MERRITT, Lockport, N. Y. Filed June 12, 1901. Serial No. 64,374. (No model.)

Claim.—1. In a veneer-cutting machine, in combination, a pressure-bar having bearing-surfaces in connection therewith and an eccentric shaft having bearings in said bearing-surfaces, the construction and arrangement being such that the eccentric applies the pressure substantially in a straight line passing through the pressure-plate and the center of the log.

2. In a veneer-cutting machine, in combination, a pressure-bar having bearing-surfaces in connection therewith located near the center of gravity of said bar and an eccentric shaft having bearings in said bearing-surfaces.

3. In a veneer-cutting machine in combination a pressure-bar and an eccentric shaft supporting said pressure-bar, the axis of said shaft being located substantially in the horizontal plane of the working edge of said pressure-bar.

4. In a veneer-cutting machine a pressure-bar, an eccentric shaft upon which said bar is pivotally supported and means for rotating said shaft.

5. In a veneer-cutting machine a pressure-bar, and an eccentric shaft passing through bearings in said pressure-bar near the center of gravity thereof, whereby said pressure-bar may be adjusted to and from the work by rotation of said shaft and may be readily tilted upon its bearings about said shaft.

6. In a veneer-cutting machine a pressure-bar, an eccentric shaft passing through bearings in said pressure-bar and means for tilting said pressure-bar about said shaft as an axis.

7. In a veneer-cutting machine, the combination, the pressure-bar 15 having bearings 16 in connection therewith, the shaft 9 having eccentric portion 17 in connection with said bearings, and a lever rigid with said pressure-bar whereby the pressure-bar may be rocked upon said eccentric shaft as an axis.

8. In a veneer-cutting machine, an eccentrically-mounted shaft, a sleeve surrounding said shaft, a pressure-bar mounted on eccentric bearings on said sleeve, a pivoted ball-bearing having lag-screws connected therewith, said lag-screws being supported on said sleeve, and means for rotating said sleeve and said shaft.

9. In a veneer-cutting machine, an eccentrically-mounted shaft, a sleeve surrounding said shaft, a pressure-bar mounted on eccentric bear-

lugs on said sleeve, a pivoted knife-carriage having hangers pivotally connected therewith, said hangers being supported on said sleeve, and means for rotating said sleeve and said shaft independently.

10. In a veneer-cutting machine, in combination, a pressure-bar, bearings in connection therewith, an eccentric sleeve passing through said bearings, an eccentric shaft passing through said sleeve, a pivoted knife-carriage, hangers connected to said knife-carriage and providing journals for said sleeve, and a means for rotating said eccentric shaft.

11. In a veneer-cutting machine, in combination, a pressure-bar, bearings in connection therewith, an eccentric sleeve passing through said bearings, an eccentric shaft passing through said sleeve, a pivoted knife-carriage, hangers pivotally connected to said knife-carriage and providing journals for said sleeve, means for rotating said eccentric shaft, and means for adjusting the position of said hangers, sleeve and shaft without effecting the position of the knife-carriage.

12. In a veneer-cutting machine, in combination, a pressure-bar, bearings in connection therewith, an eccentric sleeve passing through said bearings, an eccentric shaft passing through said sleeve, a pivoted knife-carriage, hangers pivotally connected to said knife-carriage, said sleeve being journaled in said hangers, means for rotating said eccentric shaft, and means for adjusting the position of said hangers, sleeve and shaft independently at each end of the carriage.

13. In a veneer-cutting machine, in combination, a pressure-bar, bearings in connection therewith, an eccentric sleeve passing through said bearings, an eccentric shaft passing through said sleeve, a pivoted knife-carriage, hangers pivotally connected to said knife-carriage and providing journals for said sleeve, means for rotating said eccentric shaft, and adjusting-curve-connecting said hangers to the knife-carriage whereby said hangers may be independently adjusted toward and from the work.

14. In a veneer-cutting machine, slide-blocks adapted for location in ways in a suitable framework, a shaft having eccentric bearings in said slide-blocks, a sleeve surrounding said shaft, a pressure-bar carried by said sleeve, a knife-carriage having hangers connected therewith, said sleeve being journaled in said hangers, and means for rotating said shaft.

15. In a veneer-cutting machine, slide-blocks adapted for location in ways in a suitable framework, a shaft having eccentric bearings in said slide-blocks, a sleeve surrounding said shaft, a pressure-bar carried by said sleeve, a knife-carriage having hangers pivotally connected therewith, said sleeve being journaled in said hangers, and means for rotating said shaft.

16. In a veneer-cutting machine, slide-blocks adapted for location in ways in a suitable framework, a shaft having eccentric bearings in said slide-blocks, a sleeve surrounding said shaft, a pressure-bar carried by said sleeve, a knife-carriage having hangers pivotally connected therewith, said sleeve being journaled in said hangers, and means for rotating said shaft.

17. In a veneer-cutting machine, a shaft having eccentric bearings in suitable slide-blocks, a sleeve surrounding said shaft, a pressure-bar carried by said sleeve, a knife-carriage, hangers pivotally connected to said carriage, said hangers furnishing journals for said sleeve at each end thereof, means for rotating said shaft, and means for independently adjusting relatively to the knife-carriage the hanger and its connected parts at either end of said sleeve.

18. In a veneer-cutting machine, in combination, a pressure-bar carried by an eccentric sleeve, a knife-carriage having pivoted hangers connected therewith, said eccentric sleeve being journaled in said hangers, means for rotating said sleeve, and means for rotating said hangers.

19. In a veneer-cutting machine, a pressure-bar, an eccentric shaft upon which said pressure-bar is supported for horizontal adjustment, means for rotating said shaft and means for independently adjusting the ends of said shaft.

20. In a veneer-cutting machine, a pressure-bar, an eccentric shaft upon which said pressure-bar is supported for horizontal adjustment, means for rotating said shaft and means for adjusting either end of said shaft toward or from the work independently of the other.

21. In a veneer-cutting machine, a pressure-bar, a sleeve supporting said pressure-bar, the points of support being eccentric to the axis of the sleeve whereby said pressure-bar may be adjusted by rotating the sleeve, hangers in which the ends of said sleeve are journaled, and means for independently adjusting said hangers transversely of the axis of the sleeve.

22. In a veneer-cutting machine, a pressure-bar, a sleeve supporting said pressure-bar, the points of support being eccentric to the axis of the sleeve whereby said pressure-bar may be adjusted by rotating the sleeve, hangers in which the ends of said sleeve are journaled, and means for independently adjusting said hangers transversely of the axis of the sleeve and for locking them in said adjusted position.

23. In a veneer-cutting machine, a pressure-bar, a sleeve supporting said pressure-bar, the points of support being eccentric to the axis of the sleeve, whereby said pressure-bar may be adjusted by rotating the

sleeve, hangers in which the ends of said sleeve are journaled, a knife-carriage pivotally connected to said hangers, and means for independently adjusting each of said hangers transversely of the sleeve without effecting the position of the knife-carriage.

24. In a veneer-cutting machine, slide-blocks adapted for location in ways in a suitable framework, a shaft having eccentric bearings in said slide-blocks, a pressure-bar mounted upon said shaft for tilting movement relative thereto, a knife-carriage having hangers connected therewith, said hangers being supported by said shaft and means for rotating said shaft.

25. In a veneer-cutting machine, slide-blocks adapted for location in ways in a suitable framework, a shaft having eccentric bearings in said slide-blocks, a pressure-bar mounted upon said shaft for tilting movement relative thereto, a knife-carriage having hangers connected therewith, said hangers being supported by said shaft concentrically to the axis of rotation thereof, and means for rotating said shaft.

26. In a veneer-cutting machine, slide-blocks adapted for location in ways in a suitable framework, a shaft having eccentric bearings in said slide-blocks, a pressure-bar mounted upon said shaft for tilting movement relative thereto, a knife-carriage having hangers pivotally connected therewith, said hangers being supported by said shaft, and means for rotating said shaft.

27. In a veneer-cutting machine, slide-blocks adapted for location in ways in a suitable framework, a shaft having eccentric bearings in said slide-blocks, a pressure-bar mounted upon said shaft for tilting movement relative thereto, a pivoted knife-carriage having hangers pivotally connected therewith supported by said shaft, and means for rotating said shaft.

28. In a veneer-cutting machine, slide-blocks adapted for location in ways in a suitable framework, a shaft having eccentric bearings in said slide-blocks, a pressure-bar mounted upon said shaft for tilting movement relative thereto, a knife-carriage having hangers pivotally connected therewith, said hangers being supported from said shaft, and means for adjusting said hangers to and from the work.

29. In a veneer-cutting machine, a shaft having slidable eccentric bearings in suitable supports, a pressure-bar mounted upon said shaft, a knife-carriage having hangers pivotally connected therewith, said hangers being supported from said shaft, and means for adjusting said hangers to and from the work.

30. In a veneer-cutting machine, a shaft having slidable eccentric bearings in suitable supports, a pressure-bar mounted upon said shaft for tilting movement relative thereto, a pivoted knife-carriage having hangers pivotally connected therewith, said hangers being supported from said shaft, and means for rotating said shaft, and means for swinging said hangers on their pivots and locking them in adjusted position.

31. In a veneer-cutting machine, a pressure-bar, hangers with reference to which said pressure-bar is supported for tilting or pivotal movement relative thereto, said hangers being pivoted for movement toward and from the work.

32. In a veneer-cutting machine, a pressure-bar, hangers with reference to which said pressure-bar is supported for tilting or pivotal movement relative thereto, said hangers being pivoted, and means for adjusting said hangers on their pivots toward and from the work.

33. In a veneer-cutting machine, a pressure-bar, hangers with reference to which said pressure-bar is supported for tilting or pivotal movement relative thereto, said hangers being pivoted, means for adjusting said hangers on their pivots toward and from the work, and locking them in adjusted position.

34. In a veneer-cutting machine, a pressure-bar, hangers with reference to which said pressure-bar is supported for tilting or pivotal movement relative thereto, said hangers being pivoted, means for independently adjusting said hangers on their pivots toward and from the work and locking them in adjusted position.

35. In a veneer-cutting machine, in combination, a knife-carriage, hangers in connection with said carriage, a pressure-bar, said pressure-bar being mounted for tilting or pivotal movement with reference to said hangers, and means for adjusting said hangers to and from the work.

36. In a veneer-cutting machine, in combination, a knife-carriage having hangers pivotally connected therewith, a pressure-bar mounted in said hangers for tilting or pivotal movement relative thereto, and means for adjusting said hangers to and from the work.

37. In a veneer-cutting machine, in combination, a knife-carriage having hangers pivotally connected therewith, a pressure-bar mounted in said hangers for tilting or pivotal movement relative thereto, and means for independently adjusting said hangers to and from the work.

38. In a veneer-cutting machine, a knife-carriage, hangers pivotally connected therewith, a pressure-bar mounted in said hangers for tilting or pivotal movement relative thereto, and means for adjusting said hangers relatively to said knife-carriage.

39. In a veneer-cutting machine, a knife-carriage, hangers pivotally connected therewith, a pressure-bar mounted in said hangers for tilting or pivotal movement relative thereto, and means for independently adjusting said hangers relatively to said knife-carriage.

40. In a veneer-cutting machine, a knife-carriage hangers pivotally connected therewith, a pressure-bar mounted in said hangers for tilting or pivotal movement relative thereto, and means for independently adjusting said hangers relatively to said knife-carriage, and for locking them in adjusted position.

41. In a veneer-cutting machine, a pivoted knife-carriage hangers pivotally connected therewith, a pressure-bar mounted in said hangers for tilting or pivotal movement relative thereto, means for independently adjusting said hangers relatively to said knife-carriage, and means for locking them in adjusted position.

42. In a veneer-cutting machine, an eccentrically-mounted shaft, a pressure-bar mounted on said shaft, a knife-carriage, hangers pivotally connected thereto, said hangers being supported from said shaft.

43. In a veneer-cutting machine, a shaft concentrically mounted in slidable bearings, a pressure-bar carried by said shaft, a knife-carriage, pivoted hangers connected to said knife-carriage, said hangers being supported from said shaft, means for rotating said shaft, and means for adjusting said hangers to and from the work.

44. In a veneer-cutting machine, a shaft concentrically mounted in slidable bearings, a pressure-bar carried by said shaft, a knife-carriage, pivoted hangers connected to said knife-carriage, said hangers being supported from said shaft, means for rotating said shaft, and means for adjusting said hangers to and from the work.

45. In a veneer-cutting machine, a knife-carriage having hangers connected therewith, a sleeve journaled in said hangers, a pressure-bar mounted on said sleeve for tilting or pivotal movement relative thereto, and an eccentrically-mounted shaft passing through said sleeve.

46. In a veneer-cutting machine, a knife-carriage having hangers pivotally connected therewith, a sleeve journaled in said hangers, a pressure-bar mounted on said sleeve for tilting or pivotal movement relative thereto, and an eccentrically-mounted shaft passing through said sleeve.

47. In a veneer-cutting machine, a pivoted knife-carriage having hangers pivotally connected therewith, a sleeve journaled in said hangers, a pressure-bar mounted on said sleeve for tilting or pivotal movement relative thereto, and an eccentrically-mounted shaft passing through said sleeve.

48. In a veneer-cutting machine, in combination, a pressure-bar, bearings in connection therewith, an eccentric sleeve passing through said bearings, a shaft passing through said sleeve and concentrically supported in slidable bearings, a pivoted knife-carriage, hangers pivotally connected to said knife-carriage and supported from said sleeve, means for rotating said shaft, and adjusting-curve in connection with said hangers, whereby said hangers may be independently adjusted toward and from the work.

49. In a veneer-cutting machine, in combination, slide-blocks A, shaft 5 having eccentric bearings in boxes 7 rotatable with relation to said slide-blocks, a pressure-bar mounted on said shaft, a knife-carriage, hangers 2 pivotally connected to said carriage and supported by said shaft, substantially as and for the purposes set forth.

50. In a veneer-cutting machine, a suitable frame, pivotally-mounted hangers secured to said frame, and a pressure-bar mounted in said hangers for tilting or pivotal movement relative thereto, and free to partake of the movement of the hangers about their pivotal mounting.

51. In a veneer-cutting machine, a suitable frame, pivotally-mounted hangers adjustably secured to said frame, and a pressure-bar mounted in said hangers for tilting or pivotal movement relative thereto, and free to partake of the movement of the hangers about their pivotal mounting.

689,548. VENEER-CUTTING MACHINE. LOUIS C. HENRY.
Lynchport, N. Y. Filed July 28, 1901. Serial No. 68,348. (No Model.)

Claim.—1. In a veneer-cutting machine, a pressure-bar, an immediate support for the pressure-bar, a means for moving the support to-

ward and from the work with a slow and gradual movement and a means for directly moving the immediate support toward and from the work with a comparatively quick clearing movement.

2. In a veneer-cutting machine, a pressure-bar, an immediate support for the pressure-bar, a means for moving the support toward and from the work with a slow and gradual movement and a means for directly moving the immediate support toward and from the work with a comparatively quick clearing movement and along the path in which the support moves when moved by the first stated means.

3. In a veneer-cutting machine, a pressure-bar, a support for the pressure-bar, a means for moving the support toward and from the work with a slow and gradual movement and a means for moving the same support toward and from the work with a comparatively quick clearing movement and along the path in which the support moves when moved by the first stated means.

4. In a veneer-cutting machine, a pressure-bar, means for moving said pressure-bar toward and from the work with a slow and gradual movement and means for moving said pressure-bar toward and from the work with a comparatively quick clearing movement and along the path in which it is moved by the first stated means.

5. In a veneer-cutting machine, a pressure-bar, an eccentric shaft, connections between said shaft and bar whereby the bar is adjusted upon rotation of the shaft, means for giving said shaft a gradual rotation, the limits of which may be positively fixed whereby a definite amount of adjusting movement may be given to the pressure-bar, and means for giving said shaft a quick rotation whereby a rapid movement of clearance may be given to the pressure-bar.

6. In a veneer-cutting machine, a pressure-bar, a shaft upon which said pressure-bar is concentrically mounted, means for giving said shaft a quick throw to carry said pressure-bar rapidly toward or from the work, and means for giving said shaft a slow, measurable throw whereby the position of said pressure-bar may be accurately adjusted within narrow limits.

7. In a veneer-cutting machine, a pivotally-mounted pressure-bar, and means whereby at one operation said pressure-bar may be retracted from the work and then tilted or rocked about its pivots.

8. In a veneer-cutting machine, a pressure-bar, means for moving said pressure-bar from the work with a comparatively slow and measurable adjusting movement, and a single means whereby said pressure-bar may be moved toward and from the work with a quick clearing movement and then tilted or rocked vertically.

9. In a veneer-cutting machine, a pressure-bar, an eccentric shaft upon which said pressure-bar is pivotally mounted, and means whereby the pressure-bar may be given a rapid movement toward or from the work to an extent depending upon the eccentricity of the shaft and then tilted or rocked on its pivots.

10. In a veneer-cutting machine, a pressure-bar, an eccentric shaft upon which said pressure-bar is pivotally supported, and an operating-lever for said eccentric shaft, said pressure-bar having a part rigid therewith extending into the path of movement of said operating-lever, whereby by a single movement of said lever the pressure-bar may be moved a horizontal distance equal to the full throw of the eccentric shaft and then tilted or swung up about its pivotal support.

11. In a veneer-cutting machine, a pressure-bar, a shaft upon which said pressure-bar is concentrically mounted, a collar loose upon said shaft, a worm-wheel carried by said collar, a worm adapted to engage said worm-wheel, a collar rigid with said shaft, a lever connected with said second collar whereby said shaft may be rotated, and means for locking said collars together.

12. In a veneer-cutting machine, a pressure-bar, a shaft upon which said pressure-bar is concentrically mounted, a collar loose upon said shaft, a worm-wheel carried by said collar, a worm engaging said worm-wheel, a second collar rigid with said shaft, a notch or recess in said first collar, a lever mounted upon said second collar so that it will carry such collar with it in its movement transversely of said shaft but free to swing upon said collar parallel to said shaft, and a lug upon said lever adapted to rest in said notch.

13. In a veneer-cutting machine, a pressure-bar frame, a shaft upon which said pressure-bar is concentrically mounted, a worm-wheel loosely carried by said shaft, a worm for engaging said worm-wheel, a housing for said worm carried by said pressure-bar frame, a recess in the side of said worm-wheel, a collar keyed to said shaft, a lever pivoted to said collar and having a projection therefrom adapted to rest normally in said recess so that the rotation of said worm-wheel normally carries with it the shaft, but upon disengaging the lever and worm-wheel the shaft may be revolved freely within said worm-wheel by movement of the lever.

14. In a veneer-cutting machine, in combination, the pressure-bar casing A, the eccentric shaft 10 supporting said pressure-bar casing, the collar 16 loose upon said shaft carrying the worm-wheel 18, the worm 25 mounted in said pressure-bar casing, the collar 17 keyed to said shaft, and

the spring-pressed lever 20 pivoted to said collar 17 and adapted in one position to lock said collars together.

15. In a vane-cutting machine, in combination, a pressure-bar casting, an eccentric shaft upon which said pressure-bar casting is pivotally supported, a worm-wheel meshing upon said shaft, a collar adjacent to said worm-wheel keyed to said shaft, a room in said worm-wheel, projecting lugs upon said collar, a lever pivoted between said lugs to swing toward and from said worm-wheel and having a projection thereon adapted to rest in the room in said worm-wheel.

16. In a vane-cutting machine, a pressure-bar casting or frame, a shaft upon which said casting is eccentrically mounted, a collar meshing upon said shaft, a worm-wheel carried by said collar, a worm housed in said pressure-bar casting and engaging said worm-wheel, a collar rigid with said shaft, a lever connected with said second collar whereby said shaft may be rotated, and means for locking said collars together.

17. In a vane-cutting machine, a pressure-bar, means for moving said pressure-bar toward or from the work with a comparatively slow and measurable adjusting movement, means for moving said pressure-bar toward or from the work with a comparatively quick clearing movement, and a single operating-lever by the movement of which said first-mentioned means may be disconnected from the pressure-bar and said second-mentioned means actuated.

18. In a vane-cutting machine, a pressure-bar, means for moving said pressure-bar toward or from the work with a comparatively slow and measurable adjusting movement, and a single means whereby said first-mentioned means may be disconnected from the pressure-bar and the pressure-bar moved toward or from the work with a comparatively quick clearing movement.

19. In a vane-cutting machine, a pressure-bar mounted for movement toward or from the work, a shaft in operative connection to the pressure-bar whereby the pressure-bar is so moved, means acting upon said shaft for moving said pressure-bar with a measurable adjusting movement, and means acting upon said shaft for moving said pressure-bar with a quick clearing movement.

699,547. LATER, LOUIS C. HENRY, Lockport, N. Y. Filed July 20, 1891. Serial No. 70,308. (No model.)

Claim.—1. In a vane-cutting machine, a carriage for supporting the vane-cutting knife, and supports providing ways for said carriage, said ways furnishing bearings for said carriage both above and below the line of chuck centers, the construction and arrangement being such that the cutting edge of the knife is located substantially on the line of feed and in the plane of the chuck centers.

2. In a vane-cutting machine, in combination with the usual chuck and chuck-spindles, a carriage for the vane-cutting knife reciprocable with relation to said chucks, ways for said carriage furnishing bearings therefor both above and below the line of chuck centers and feed-covers located on the line of chuck centers, whereby the strain upon the vane-cutting knife is substantially along the line of the feed-covers.

3. In a vane-cutting machine, a main frame, bearings in said main frame for the chuck-spindles, supports located on said main frame adjacent the head portions thereof, ways said supports for the slide-blocks, which support the vane-cutting carriage, said ways furnishing bearings for said slide-blocks both above and below the line of chuck centers, bearings in said supports through which the chuck-spindles pass, and feed-covers for said slide-blocks, said feed-covers being located so as to apply their pressure in the line of centers.

4. In a vane-cutting machine, a frame comprising a base portion and two head portions, in combination with supports located parallel to the inner faces of said head portions and connected to said base portion, bearings in said head portions for the chuck-spindles, supplementary bearings in said supports for the chuck-spindles, ways in said supports, said ways furnishing bearings for the slide-blocks of the vane-cutting knife carriage both above and below the line of centers of the chucks, whereby the strain upon the vane-cutting knife in operation will be divided between the two ways, substantially as and for the purposes set forth.

5. In a vane-cutting machine, a main frame, ways upon said main frame adapted for slide-blocks for a main carriage, feed-covers for said slide-blocks acting in the line of centers, threaded shafts below said feed-covers and parallel therewith, which shafts pass below the drive-spindles and are adapted to act as feed-covers for an auxiliary carriage, means for driving said feed-cover shafts from said second shafts, and means for driving said second shafts from the main feed-shaft of the machine.

6. In a vane-cutting machine, in combination, with the usual chucks and chuck-spindles, a main carriage, a feed-cover therefor, a shaft passing below said chuck-spindles, and gearing at one end with said feed-cover and threaded at its other end whereby it is adapted to engage the feed-out of an auxiliary carriage located on the opposite side of the line of centers from the main carriage.

7. In a vane-cutting machine, in combination, with the usual chucks and chuck-spindles, a main carriage, a feed-cover therefor, a shaft passing below said chuck-spindles, and gearing at one end directly with said feed-cover and threaded at its other end whereby it is adapted to engage the feed-out of an auxiliary carriage located on the opposite side of the line of centers from the main carriage.

8. In a vane-cutting machine, a tool-carriage supported upon slide-blocks in suitable ways, feed-covers for said slide-blocks, gears connecting said feed-covers with shafts parallel therewith, a driving-shaft *F* located at a substantial distance within the ends of said feed-covers and auxiliary shafts and toward the center of the machine, and gearing between said driving-shaft and said auxiliary shafts, substantially as and for the purposes set forth.

9. In a vane-cutting machine, in combination, a tool-carriage supported upon slide-blocks in suitable ways, feed-covers therefor, parallel shafts geared directly to said feed-covers and extending toward the center of the machine, a driving-shaft located at a substantial distance within the ends of said feed-covers and toward the center of the machine, and driving connections between said shafts.

10. In a vane-cutting machine, in combination, a frame comprising a base portion and head portions integral therewith, chuck-spindles having bearings in said head portions, an independent way or support located adjacent one of said head portions and providing supplementary bearings for one of said spindles and a way for the slide-block of a tool-carriage, a nut located upon said spindle between said head portion and said support, means for rotating said spindle, and means for independently controlling the rotation of said nut, the construction and arrangement being such that the strain resulting from the digging of the work is borne by the head portion of the frame while the strain resulting from the action of the tool-carriage is borne in the first instance by said support.

11. In a machine of the character described, a frame comprising a base portion and head portions, supports located on said base portion adjacent the inner faces of said head portions, ways in said supports adapted for the slide-blocks of a tool-carriage, spindles supported in bearings in said head portions and in said supports, nuts controlling the longitudinal movement of said spindles located between said head portions and said supports, whereby the strain resulting from the digging of the work is borne by the head portion of the frame, while the strain resulting from the action of the tool-carriage is borne in the first instance by the supports.

12. In a vane-cutting machine, in combination, a frame having the base portion *B* and the integral head portions *C*, *D*, a support or way *D*, a spindle *E* supported in bearings in one of said head portions and in said way, a nut *F* upon said spindle located between said support and said head portion, means for driving said spindle, and means for controlling the rotation of said nut independently of said spindle.

13. In a vane-cutting machine, in combination, a frame, suitably-driven spindle supported upon said frame, suitable ways upon said frame, slide-blocks in such ways, feed-covers 43 for each slide-block, a second shaft 45 from which shafts 43 are driven, shaft 50 from which said shafts 43 are driven, and a main feed-shaft *F* from which said shaft 50 is driven, the construction and arrangement being such that the main feed-shaft *F* is inside of the vertical plane of the end of the shaft 45.

14. In combination, a lathe-spindle, a nut controlling the longitudinal movement of said spindle, and power-actuated frictional means for locking said nut from rotation.

15. In combination, in a machine of the character described, a lathe-spindle, a nut controlling the longitudinal movement of said spindle, a wheel connected to said nut to rotate therewith, and a frictional device located within the rim of said wheel on said wheel whereby said nut may be prevented from rotation.

16. In combination, a lathe-spindle, a nut controlling the longitudinal movement of said spindle, a rimmed wheel keyed to said nut, friction-chess adapted to bear within the rim of said wheel, and means for forcing said chess against said rim whereby the wheel will be held from rotation.

17. In combination, a lathe-spindle, a nut controlling the longitudinal movement of said spindle, a rimmed wheel keyed to said nut, friction-chess adapted to bear one against the inner face of said rim and one against the hub of said wheel, a flattened shaft upon which the sides of said chess normally rest, and means for rocking the said shaft whereby the said chess will be forced against the adjacent parts of said wheel and said wheel will be locked against rotation.

18. In a vane-cutting machine, in combination, the threaded spindle 1, nut 8 upon said spindle, wheel 9 carried with said nut, friction-wheels 25 and friction-chess 24 adapted to bear within said wheel, flattened shaft 22 controlling the position of said friction device, and lever 26 for rocking said shaft.

699,548. MUMFORD TURNER. BENJAMIN F. D. MILLER, Worcester, Ohio, assignors to Frank Herman and C. C. Adams, Worcester, Ohio. Filed July 15, 1891. Serial No. 68,222. (No model.)

Claim.—1. In a shoe-last the combination with a last frame having a center bar, of lugs projecting from the back of said bar, notched spring-actuated catches located adjacent to said lugs, a cord connecting said catches, and a key having a longitudinally-apertured cross-bar which is threaded on said cord, said key being constructed to be turned to tighten said cord to operate said catches, substantially as described.

2. In a shoe-last, the combination with a shoe-board bearing apertured U-shaped brackets, of a last frame having a center bar, of lugs projecting from said center bar and constructed to fit said apertures in said brackets, of pivoted spring-actuated catches constructed to engage apertures in said brackets, a cord connecting said catches, and a key connected to said cord and constructed to be operated to disengage said catches, substantially as described.

3. In a shoe-last, the combination with a shoe-board bearing U-shaped brackets having apertured cross-bars, of a last frame, spring-actuated notched catches mounted on said last and located to engage said apertures in said brackets, a cord connecting said catches, and means for tightening said cord to operate said catches to disengage them from said brackets, substantially as described.

4. In a shoe-last, the combination with frames for supporting heels and constructed to be fitted over, of spring-actuated cross bearing shoes and constructed to engage said frames, angular shafts bearing crank-arms, cords passing around said shafts and connected to said crank-arms, spring-actuated lever-arms mounted on said angular shafts, levers arranged to be operated by the laces of the shoe to turn the said frames, cords connected to said lever-arms and to said knee-operated levers, substantially as described.

5. In a shoe-last, the combination with a last, of parallel guides mounted on said last with an intervening space, of an axle bearing sliding frames, oppositely-actuating arms mounted on said axle and constructed to fit under said guides and hold the axle in place, said arms being located in substantially the same plane with said last, substantially as described.

699,549. CUSHIONING DEVICE FOR BOOTS OR SHOES. FRANK P. MONTGOMERY, Philadelphia, Pa. Filed July 20, 1891. Serial No. 68,212. (No model.)

Claim.—1. An elastic heel-pad for boots and shoes, comprising a flexible upper strip, a metal plate backing the same, a folded strip, and a mass of elastic material contained between said folds, the top strip, the metal plate, and the upper fold of said insulating strip being secured together, substantially as specified.

2. An elastic heel-pad for boots and shoes, said pad comprising an upper strip of flexible material, a metallic plate supporting the same, a folded strip, and a mass of elastic material contained between said folds, the top strip, the metal plate, and the upper fold of the insulating strip being secured together and the lower fold of said strip being provided with a coating of cement whereby it may be secured to the inside of the boot or shoe, substantially as specified.

3. An elastic heel-pad for boots and shoes, comprising a flexible top strip, a metal plate supporting the same, a mass of elastic material secured to and supporting said plate, and a strip including said elastic material, substantially as specified.

4. An elastic heel-pad for boots and shoes, comprising a top strip, a metal plate supporting the same, and a mass of elastic material supporting the plate, said mass of elastic material being of less dimensions than the plate, and the latter and the top strip having ventilating-openings in the projecting portion, substantially as specified.

699,550. AMALGAMATOR. JONATHAN McKEEVER, Louisville, Ky., assignor of one-fifth to William H. Rigdon, Louisville, Ky. Filed Sept. 28, 1891. Serial No. 70,120. (No model.)

Claim.—1. In an amalgamator, the combination with a case having a mercury-holding basin and provided with chambers and having means for admitting water under pressure to said chambers, of a chain-tube in one of said chambers and an outlet-pipe in another of said chambers, said tube and pipe each having communication with said basin and each having series of openings for the admission thereto of water from their respective chambers, substantially as described.

2. An amalgamator embracing a casing having a mercury-holding basin and a chain-tube in communication with said basin, and means for admitting water to said chain-tube embracing series of downwardly-inclined openings through which the water can run at an angle to the others and a water-pressure chamber surrounding the chain-tube, for the

purpose set forth, said amalgamator also having means through which water is supplied thereto, means for withdrawing amalgam and conducting means for the tailings.

3. An amalgamator having its sluice-tube provided with a series of downwardly-inclined openings of which the lower ones are at an angle to the others, said amalgamator also having a basin for mercury in communication with said sluice-tube and a conducting means for tailings in communication with said basin, combined with a water-supplying means.

4. In an amalgamator, the combination with a case having a mercury-holding basin, provided with means for withdrawing amalgam therefrom, said casing also having outer chambers, an intermediate chamber and a separate chamber having openings leading to said outer and intermediate chambers and provided with means for the admission of water under pressure to said separate chamber, in combination with overflow-pipes in said outer chambers, having apertured walls for the admission of water thereto, and a sluice-tube in said intermediate chamber, having openings for the admission of water from said intermediate chamber, said pipes and tubes having communication with said basin, substantially as described and for the purpose specified.

5. In an amalgamator, the combination with a case having a mercury-holding basin, provided with means for withdrawing amalgam therefrom, said casing also having outer chambers, an intermediate chamber and a separate chamber having openings leading to said outer and intermediate chambers, and means through which water under pressure is admitted to said separate chamber, of a sluice-tube in said intermediate chamber, having a series of downwardly-inclined apertures for the admission thereto of the water from said intermediate chamber, the apertures near the lower end of said tube extending through the wall of the case at an angle nearer the horizontal than those above, said overflow-pipes in said outer chambers, having non-radiated apertures in their walls for the admission of water from their respective chambers, said tube and pipes having communication with said basin, substantially as described and for the purpose specified.

6. An amalgamator having its sluice-tube provided with a series of downwardly-inclined openings of which the lower ones are at an angle to the others, said amalgamator also having a basin for mercury in communication with said sluice-tube and an overflow-pipe in communication with said basin, said overflow-pipe being formed with apertures so arranged as to cause the water entering the pipe through the case to give a whirling motion to the material in said pipe, and means through which water is supplied to said sluice-tube and overflow-pipe.

699,551. **REDOUCING MECHANISM.** WALKER & McKENNEY, Chicago, Ill. Filed July 24, 1901. Serial No. 66,962. (No model.)

Claim.—1. In a reducing mechanism, the combination of a pivoted guide, a lever sliding therein, a rock-shaft and an arm fixed to said rock-shaft and pivotally connected to said lever.

2. In a reducing mechanism, the combination of a rock-shaft having a fixed axis, an arm secured to said shaft, a bar pivoted to said arm, means for rocking said shaft and a guide for said bar, whereby the longitudinal axis of said bar may vary its inclination but always passes through a fixed point.

3. In a reducing mechanism, the combination of a rock-shaft, an arm keyed thereto, a bar pivoted to said arm, a guide for said bar, a second arm keyed to said rock-shaft and means for operating said second arm.

4. In a reducing mechanism, a bar pivoted at one extremity to a rocking arm and at the other extremity to a driven part of the mechanism in combination with a guide wherein said bar is slidingly mounted, said guide being revoluble upon a fixed axis.

5. In a reducing mechanism, the combination of a bar or lever pivotally and slidingly supported between its extremities, said bar or lever

being connected at one end to a driven part of the device, a rocking arm pivotally connected to the other end of said bar or lever, a rock-shaft for driving said rocking arm, a second arm for driving said rock-shaft, a crank, and connections between said crank and said second arm whereby the rotation of said crank is transmitted to said second arm.

6. In a reducing mechanism, the combination of a crank, a rod connected thereto, a rock-shaft, an arm keyed to said shaft and pivoted to said rod, a second arm keyed to said shaft, a bar or lever pivoted to said second arm, a guide wherein said bar or lever is slidingly mounted, said guide having a fixed pivot, and a representing driven member connected to said bar or lever.

7. In a reducing mechanism, the combination of a driven reciprocating member, a rod connected thereto, a bar or lever connected to said rod, a pivotally-supported guide for said bar or lever, a rock-shaft, an arm keyed to said shaft and pivoted to said bar or lever, and means for operating said rock-shaft.

8. In a reducing mechanism the combination of a sliding block, means for guiding said block, a connecting-rod pivoted to said block, a bar or lever pivoted to said rod, a guide wherein said bar or lever is slidingly mounted, said guide being pivoted on a fixed axis, a rock-shaft, an arm keyed to said shaft and pivoted to said bar or lever, and means for operating said rock-shaft.

9. In a reducing mechanism, the combination of a reciprocating block, guides for said block, a bar or lever, a rod connecting said bar or lever to said block, a pivoted guide wherein said bar or lever is slidingly mounted, an arm pivoted to said bar or lever, a rock-shaft keyed to said arm, a second arm keyed to said rock-shaft, a crank and a connecting-rod joining said crank to said second arm for operating the latter.

699,552. **PUNCHING-MACHINE.** BAKER & McLAUGHLIN, Brooklyn, Minn. Filed Oct. 24, 1901. Serial No. 79,781. (No model.)

Claim.—1. The combination, with a base having a bracket or standard thereon, of a sector-shaped block pivoted on said base between it and said bracket and adapted to describe a partial revolution thereon, a series of punches carried by said block each punch being provided with a leg, means engaging each leg to support its punch during the movement of said block and prevent longitudinal movement of said punch except at a certain predetermined point on said base, a lever adapted to engage each punch when opposite said predetermined point to perform the punching operation, and a hook device adapted to engage each leg and return its punch to its normal position when the punching operation has been completed.

2. The combination, with a base, of a block pivoted thereon, a series of punches mounted in said block, means for normally holding said punches in their raised position and preventing their depression except when opposite a certain predetermined point on said base, means for depressing said punches one at a time when opposite said described point, and means engaging said punches to return them to their normal position after the punching operation has been completed.

3. The combination, with a suitable base, of an oscillating block thereon, a series of punches loosely mounted in said block and provided with a corresponding number of legs, curved arms engaging said legs and normally holding said punches in their raised position, a space being provided between the ends of said arms to permit the punches to drop when opposite that point, a hook 13 projecting into the space between said arms and engaging the punch-leg opposite the same, means for depressing said hook and the punch with which it is engaged, and means for elevating them, substantially as described.

4. The combination, with a base, of an oscillating block mounted thereon and provided with a series of vertical holes and slots communi-

cating therewith, a series of punches provided in said holes and having legs extending into said slots, curved arms adapted to project into said slots and engage said legs to support said punches, a space being provided between the ends of said arms to permit the depression of a punch when opposite that point, a hook 13 projecting into said space and engaging the punch-leg therein, and a lever 15 connected with said hook and adapted to engage the upper end of the punch, substantially as described.

5. The combination, with a base, of an oscillating sector-shaped block thereon, a series of punches provided near the curved face of said block and having legs fitting loosely in vertical slots therein, stationary curved bars extending around the face of said leg and normally engaging said legs and supporting said punches in their raised position, a space being provided between the ends of said bars wherein the legs are slidable to permit the depression of their punches when opposite that point, means for depressing the punches, and means for raising the same.

6. The combination, with a suitable base, of an oscillating punch-holder thereon, a series of punches loosely mounted in said holder, arms for normally holding said punches in their raised position and preventing depression thereof except when opposite a certain predetermined point on said base, an operating-lever, and means for returning said punches to their normal position when released by said lever after the punching operation has been completed.

7. The combination, with a suitable base, of an oscillating punch-holder thereon, a series of punches loosely mounted in said holder, arms for normally holding said punches in a raised position and preventing their depression, a space being provided between said arms to permit the punches to drop through when opposite that point, an operating-lever adapted to engage said punches one at a time and a device carried by said lever to engage a punch when depressed and elevate the same to its normal operative position after the punching operation has been completed.

699,553. **CORD-CUTTING KNIFE FOR GRAIN-BINDING MACHINES.** ALBERT R. HILLER, Naperville, Ill. Filed Feb. 20, 1901. Serial No. 48,984. (No model.)

Claim.—1. A revolvable cord-cutting knife for grain-binding machines having a guard in advance of and above the cutting edge thereof to prevent the cord from prematurely coming in contact with the cutting edge of the knife at a point between the binder-arm and the cord-holder, substantially as described.

2. A revolvable cord-cutting knife for grain-binding machines, comprising a central plate, upturned blades each having a cutting edge, said cutting edges being reversely disposed and guards disposed above and projecting in advance of the said cutting edges, substantially as described.

3. In a machine of the class described, the combination of a cord-holder, a revolvable knife, and a guard, revolvable with the knife and extending in advance of and above the cutting edge thereof, said guard being adapted when the cord is laid, to keep the cord out of contact with the cutting edge of the knife, between the binder-arm and the cord-holder, substantially as described.

699,554. **ROCK-SHIFTER.** WILLIAM F. SWEETMAN, Macon, Ga. Filed Dec. 18, 1901. Serial No. 38,091. (No model.)

Claim.—1. In a device, the combination with a body having a discharge-orifice, of a sprayer-open rotatably mounted upon the body in front of and concentrically to the discharge-orifice, said open being movable into and out of alignment with the orifice upon its rotation.

2. In a device, the combination with a body having an eccentrically-disposed discharge-orifice, of an inclined sprayer-open rotatably mounted upon the body in front of and concentric to the discharge-orifice, said open being movable into and out of alignment with the orifice upon its rotation on the body.

3. In a device, the combination with a body, of a tubular casing revolvably mounted upon the body, said body having a discharge-opening communicating with the interior of the casing and located concentrically to the axis of rotation of said casing, and an inclined sprayer-open located within the casing and movable into and out of alignment with the discharge-orifice upon the rotation of the casing.

4. In a device, the combination with a body having a discharge-opening, of a tubular casing mounted upon the body and projecting therefrom, and a sprayer-open arranged within the casing in front of the discharge-opening of the body and movable into and out of the path of the stream discharging through the opening, said open having inwardly-turned guide-flanges at its side edges.

5. In a device, a body having a discharge-orifice, and a sprayer-open mounted upon the body in front of the discharge-orifice and having guide-flanges at its side edges, the free edges of said flanges overhanging the open.

6. In a device, a body having a discharge-orifice, and a sprayer-open mounted upon the body in front of the discharge-orifice and having guide-flanges at its side edges, the flanges curving inwardly and overhanging the open.

699,555. **PAINT-DRIVER.** DAVID J. O'NEIL, Cincinnati, Ohio. Filed July 24, 1901. Removed Oct. 2, 1902. Serial No. 51,573. (No specimens.)

Claim.—1. A driver for paints, oils, and such like, resulting from the combination of manganese, lead, and calcium oxide, with resin-oils, at an elevated temperature, substantially as specified.

2. A driver for paints, oils, and such like, resulting from the combination of manganese, lead, and calcium oxide with resin-oils at an elevated temperature, and reduced to a proper consistency with a suitable solvent, substantially as specified.

699,556. **PLASTER.** JOHN J. GLENN, New York, N. Y. Filed Dec. 22, 1901. Serial No. 34,941. (No model.)

Claim.—A plaster, comprising two conical jaws tapered to a point at one end, a pivotal connection between the jaws at the upper end, handles extending from the jaws, portions of said handles being projected laterally one above the other, and a spring for normally holding the jaws closed.

699,557. **DISPLAY DEVICE.** JAMES K. O'NEIL, Washington, W. Va. Filed Aug. 12, 1901. Serial No. 71,773. (No model.)

Claim.—A display device consisting of the base-plate having wings united at an angle approximating a right angle, and transversely-extending socket-bases arranged one on each of the said wings and one above the other and closed at their inner ends by the wings joining them on which the respective socket-bases are provided substantially as set forth.

699,558. FIRE-ESCAPE. FREDERICK GUNDMANN, Brooklyn, N. Y.
Filed Jan. 15, 1901. Serial No. 43,729. (No model.)

Claim.—1. A fire-escape, comprising a rope, in combination with a friction-block and three pulleys therein, two above, over which the rope passes on its way in and out, while the third pulley is below for the rope to pass around it in a loop, the two upper pulleys being in fixed bearings, while the third and lower pulley is freely movable toward and from the first two so as to grip the rope between them, substantially as described.

2. The combination with the rope of a fire-escape, of a detachable suspending-plate having an eye *e'*, and a slot through which a light of the rope may be passed, and a locking-latch hinged to the plate on one side of the slot and adapted to swing in a path substantially at right angles to and through a light of rope thrust through the slot, whereby the plate may be locked to a light of the rope at any point, substantially as described.

3. The combination with the rope and block of a fire-escape, of a bracket provided with means for clamping it to a window-cash, a suspending device secured to the bracket, and a gripping-rod carried by the bracket and having its end pointed and extending downwardly at an angle from the bracket and adapted to enter and engage the window-frame in a plane parallel to the window-cash, substantially as described.

699,559. HATCH DRESS FASTENER. MARY OGDEN, Baltimore, Md.
Filed Sept. 12, 1900. Renewed Oct. 21, 1901. Serial No. 39,672. (No model.)

Claim.—1. As a new article of manufacture, a hat and drum fastener comprising a flexible strip provided with a row of hollow, convex button-heads, contiguous to each other, whereby to clasp a row of buttons placed closely together, and also having a body portion provided along each edge with a series of apertures each adapted to receive suitable stitching means, as and for the purpose set forth.

2. A drum-fastener, comprising a flexible strip provided with a row of hollow, convex button-heads contiguous to each other, and also provided along each edge with a series of apertures; means engaging the apertures along one edge of said strip whereby to secure said edge to one edge of a garment; and two pronged hooks secured by one prong at intervals in the apertures along the other edge of said strip, with the other prongs of said hooks taking in the opposing edge of the garment, as and for the purpose set forth.

699,560. BEET-HARVESTER. HERBERT W. PALMER, Hamilton, Mich., assignor of one-fourth to Richard H. De Mott, Holland, Mich.
Original application filed Mar. 6, 1901, Serial No. 39,661. Divided and this application filed Sept. 20, 1901. Serial No. 73,971. (No model.)

Claim.—1. In a beet-harvester, the combination of the opposing cutters composed each of a body portion provided on its under side with a central projection forming outwardly-flaring shoulders, and plate-cutters

shutting at their inner edges against said shoulders, and secured to the body portion and provided at their outer edges each with a notch and with a projecting tooth portion, the teeth of each cutter being arranged to enter the notches of the opposing cutter in the operation of the device, substantially as set forth.

2. In a beet-harvester, the cutter, substantially as described, comprising a body portion and a circumferential series of plate-cutters secured thereto and provided each in its cutting edge with a notch and having at each edge a projecting tooth spaced apart from the adjacent notches by an intervening cutting portion, substantially as set forth.

3. In a beet-harvester, a circular cutter-head having its periphery formed with notches and with projections conforming to said notches whereby the projections of one cutter may enter the notches of a matching cutter and having cutting edges between the adjacent notches and projections.

4. The combination of the opposing cutters provided each in its cutting edge with notches and having on each edge projecting teeth to enter the notches of the opposing cutter, shafts supporting said cutters, means for operating each shaft, supports for said shafts, and means whereby the cutters may be held yieldingly together, substantially as set forth.

5. In a beet-harvester, the combination of the main frame, the cutters having upright shafts, brackets having bearings for said shafts and pivoted at their upper ends, a spring connecting each bracket below said pivot, and stop devices operating between the opposite brackets and adjustable, substantially as set forth.

6. The combination, substantially as described, of the framing, the cutters having upright shafts, the brackets having bearings for each shaft and pivotally supported at their upper ends from the framing, and stop devices between the opposite brackets consisting of bars arranged at their outer ends for abutment by the brackets, and fastening means at the inner ends of said bars, substantially as set forth.

699,561. BEET-PULLER. HERBERT W. PALMER, Hamilton, Mich.
Filed Dec. 20, 1901. Serial No. 47,905. (No model.)

Claim.—1. The combination is a beet-puller, of a V-shaped beam, handle-bar having vertical adjustment as set forth, braced standards bolted to the rear end of the beam and opened as shown, a brace-iron connecting each standard with its respective member of the beam, the brace-iron passing through the beam member and an ear on the standard, the upper end of the brace-iron being headed as shown, and its lower end threaded and provided with nut on each side of the said ear, elongated and horizontally-disposed runners rigid with the standards and inclined laterally, substantially as described, rigid with the runners, as set forth.

2. The combination in a beet-puller substantially as described, comprising a beam, handle-bar and standards as shown, of means permitting independent adjustment of the handle-bar and standards, and beet-raising means consisting of elongated runners rigid with the standards, and a substantially triangular vertically-disposed plate rigid with the runners supporting inclined later-arms as set forth.

3. The combination in a beet-puller substantially as described, comprising a beam, handle-bar and standards as specified, of means permitting independent adjustment of the handle-bar and standards, inclined braces connecting the latter and the beam and arranged between the

standards as shown, and beet-raising means consisting of elongated runners rigid with the standards supporting inclined later-arms as set forth.

699,562. RUBBER ROOF OR HOSE. JAMES L. FINEY, Astoria, R. I.
Filed Mar. 20, 1901. Serial No. 43,699. (No model.)

Claim.—1. As an article of manufacture, a shoe-heel provided with a rigid collar-like flange integral therewith, said flange being widest at its middle and narrowed toward its ends, said flange having a bevel edge and being located slightly inward from the edge of said heel for the purpose of admitting the lower edge of the outer rubber of a shoe, the said collar-like flange then being disposed parallel to said outer rubber so as to be completely hidden thereby.

2. As an article of manufacture, a shoe-heel provided upon its upper face with a rigid collar-like circumferential flange integral therewith and provided with a bevel edge and also with a circumferential shoulder, both said bevel edge and said shoulder extending the entire length of said flange and parallel therewith, said shoulder being for the purpose of shutting the edge of the outer rubber of a shoe, for the purpose of forming an external seam on the same plane with the upper face of the heel, said flange being widest at its middle portion and gradually contracting in width toward its respective ends.

699,563. APPARATUS FOR EXTRACTING TAR FROM GUM. FREDERICK FLINTHOLM, Fort Wayne, Ind.
Filed Aug. 12, 1901. Serial No. 71,911. (No model.)

Claim.—1. In apparatus for extracting tar from gum, the combination with a coal-cup having vertical gas-inlet passages, of two or more counterbalanced regulating and tar-extracting drums, connected one within the other, and having walls composed of injecting and impact plates in said cup, one of said gas-inlet passages opening into each drum, substantially as described.

2. In apparatus for extracting tar from gum, a series of drums having concentric walls, each wall being composed of injecting and impact plates, in combination with an annular gas-supply channel and annular coal-cups, substantially as described.

3. In a tar-extracting apparatus, the central and annular gas-inlet passages and annular tar-cups, in combination with the compound drums having concentric walls, composed of injecting and impact plates, and a drum for the central gas-inlet, substantially as described.

4. In apparatus for extracting tar from gum, the coal and regulating chamber constructed, with annular walls, and annular bottom plates, forming gas-passages, as *d* and *d'* open at top and bottom, and annular coal-cups, closed at the bottom and open at the top, in combination with the regulating and tar-extracting drums closed at the top, and having these concentric perforated walls in said cups, substantially as described.

5. In apparatus for extracting tar from gum the combination with the outer case, of the annular coal-cups, each having a bottom opening, a top pocket *d'* extending below and connecting said cups with the outer wall of the chamber, and an overflow-tap connecting with the wall of the opening of said pocket, substantially as described.

699,564. ROSE-HANGER LOCK. THOMAS C. FREESTY, Milford, Mass., assignor to the T. C. Freesty Company, Limited, Albany, N. Y., a Limited Partnership. Filed Oct. 10, 1900. Serial No. 39,694. (No model.)

Claim.—1. A sheet-metal door-hanger loop having an integral body portion and head, each of which is formed with bearings for the roller, the opposing portions of the head and body portion having said bearings being a less distance apart than the overhanging portions on the opposite sides thereof.

2. A sheet-metal door-hanger having an integral head and body portion each having an inwardly-extending portion having the bearings for the roller.

3. A sheet-metal door-hanger having an integral head and body portion each having an inwardly-extending portion having the bearings for the roller, the edges of said body portion being carried inwardly to a point on an approximate plane with said inwardly-extending portion.

699,565. BUTTON-GARDING MACHINE. WILLIAM J. PEAR, New-
port, Tenn. Filed May 14, 1901. Serial No. 49,571. (No model.)

Claim.—1. In a button-fining or turning device, the combination of a slotted member through which the buttons are successively passed, a rotating member beside the slotted member, and clutch mechanism controlled by the passage of buttons through the slot, whereby the slotted member is locked to the rotating member for a half-revolution, upon the entrance of an improperly-fining button into the slot, substantially as described.

2. In a button-fining or turning device, the combination of a rotatable cylinder having a transverse slot through which the buttons are successively passed, a rotating leg beside the cylinder, clutch-arms pivoted to the cylinder on opposite sides of the slot and adapted to project into the latter if an improperly-fining button enters it, and thereupon to be engaged by the leg, and a cam-plate for disengaging the clutch-arms from the leg when the cylinder has made a half-revolution, for the purpose and substantially as described.

3. The combination, with the feed-drum, and the feed-channel, of a cylinder interposed in the channel and having a slot forming a part of said channel, a pair of clutch-levers pivoted to the cylinder on opposite sides of and having their inner ends projecting into said slot, a spring for forcing the outer ends of said clutch-levers apart, and a rotatable disk beside the cylinder, having a leg adapted to engage a clutch-arm when the latter is displaced by the entry of an improperly-fining button into the slot, and a fixed cam-plate beside the disk adapted to cause the clutch-arm to disengage the leg when the cylinder has made a half-revolution, for the purpose and substantially as described.

4. The combination of the feed-hopper, the drum having its periphery forming the bottom thereof provided with a series of recesses adapted to contain buttons, and a circumferential peripheral groove intersecting

the recesses; with a stripper for forcing the buttons out of the recesses into said channel.

5. The combination is a button-feeding machine, of means for attaching buttons to the card; with a feed-hopper, a feed-drum having peripheral recesses for removing buttons from the hopper, and an intersecting peripheral groove and a channel for conducting buttons from the drum to the attaching mechanism, and means for periodically imparting a series of step-by-step movements to the drum, substantially as described.

6. The combination is a button-feeding machine, of means for attaching buttons to the card, a feed-hopper, and a feed-drum having peripheral recesses for taking buttons from the hopper, and a peripheral groove intersecting the recesses; with a channel for conducting buttons from the drum to the attaching mechanism, a button-stripper beside said channel projecting into the peripheral channel in the drum, and means for imparting a series of step-by-step movements to the drum, and then allowing it to remain at rest while the attaching mechanism operates substantially as described.

7. In a button-feeding machine, the combination of means for attaching disk-shaped buttons to cards, and button-feeding mechanism; with a movable bar adapted to engage the periphery of the buttons and turn them on their axes to bring them into proper position for engagement of the attaching device, substantially as described.

8. In a button-feeding machine, the combination of a chamber to contain the buttons during the attaching operations having a movable side wall; with mechanism whereby said wall is moved out of the way to permit the removal of the carded buttons from the chamber, substantially as described.

9. In a button-feeding machine the combination of a chamber to contain the buttons during the carding operation, said chamber having a movable rear wall, and mechanism for feeding a card through said chamber; with mechanism for attaching buttons to the card while in said chamber, and means for raising the movable wall of said chamber to permit the card to be advanced with the carded buttons, substantially as described.

10. In a button-feeding machine, the combination of button-feeding mechanism, and a shaft for operating the same once for each revolution; the button-attaching mechanism, a second shaft for operating the latter once during each revolution thereof, and a main shaft adapted to be continuously driven; with gearing whereby the first shaft is operated a number of times from and during a half-revolution of said main shaft, and gearing whereby said second shaft is operated once from and during a half-revolution of the main shaft, said first shaft and its mechanisms being idle when said second shaft and its mechanisms are in operation, and vice versa.

11. In a button-feeding machine, the combination of button-feeding mechanism and a shaft for operating the same once for each revolution; the card-feeding mechanism, staple-forming mechanism and button-attaching mechanism, a second shaft for operating the latter mechanisms once during each revolution thereof, and a main shaft adapted to be continuously driven; with gearing whereby the first shaft is operated four times from and during a half-revolution of said main shaft, and stopped during the remaining portion of the revolution thereof; and gearing whereby the second shaft is operated once from and during the half-revolution of the main shaft and stopped during the completion of the revolution thereof; said first shaft and its mechanisms being idle when said second shaft and its mechanisms are in operation, and vice versa, all substantially as and for the purpose set forth.

12. The combination of means for simultaneously stapling a number of buttons to cards; with a single button-feeding feed device, adapted to feed the proper number of buttons one by one in succession to the stapling means while the latter is at rest until the desired number is fed in, and then stopping the feeding operation during the stapling operation, substantially as described.

13. The combination of a plurality of stapling devices for simultaneously attaching a plurality of buttons to cards; with a single feed device adapted to feed a predetermined number of buttons one at a time to the stapling devices while the latter are idle, the stapling and feeding operations occurring alternately.

14. The combination of means for simultaneously forming a plurality of staples, and a plurality of devices for simultaneously driving the said staples into a card; with a single feed device adapted to feed one button at a time to the stapling device until the desired number of buttons is fed thereto, substantially as described.

15. The combination of mechanism for simultaneously forming a plurality of staples, means for feeding an impure card thereto, and a plurality of devices for simultaneously driving the said staples through the card; with a single feed device and means for operating it repeatedly to feed a plurality of buttons one at a time onto the card until the desired number are in position to be secured thereto by the staples, substantially as described.

16. In a button-feeding machine, the combination of card-feeding mechanism, staple-forming mechanism, a plurality of devices for simultaneously attaching a plurality of staples to the card; with a single feed device and mechanism for causing said device to feed a plurality of buttons one by one successively into position beneath the several attaching devices to be subsequently simultaneously attached to the card substantially as described.

17. In a button-feeding machine, the combination of card-feeding mechanism, and a plurality of devices for simultaneously attaching a plurality of staples to the card; with a single feed device and mechanism for causing each device to feed a predetermined number of buttons one at a time in position to be simultaneously secured to the card by the staples, substantially as described.

18. In a button-feeding machine, the combination of button-feeding mechanism, a rotatable button-feeding device through which the buttons are fed, and button-attaching mechanism; with staple-driving mechanism, and staple-clench mechanism, substantially as described.

19. In a button-feeding machine, the combination of a single feed device, means for causing said device to feed a predetermined number of buttons one by one, and means for adjusting each button in a row on the card in position for attachment thereto; with means for simultaneously forming a number of wire staples, means for simultaneously driving the staples through the row of buttons and card to attach them to the latter, substantially as described.

20. In a button-feeding machine, the combination of a single device for feeding a predetermined number of buttons one by one to the stapling mechanism, a rotatable device for feeding the buttons alike as they are fed, and means for assembling the buttons in a row on a card for attachment thereto; with mechanism for simultaneously driving staples through the row of buttons to attach them to the card, the series of buttons being fed after the stapling operation, substantially as described.

21. In a button-feeding machine, the combination of card-feeding mechanism, a single device for feeding buttons one by one to the stapling mechanism, mechanism for feeding the buttons alike as fed, button-attaching mechanism, and button-holding mechanism; with wire-feeding mechanism, staple-forming mechanism, staple-driving mechanism, and staple-clenching mechanism, substantially as described.

22. In a button-feeding machine, the combination of card-feeding mechanism, a single feed device, means for causing said device to feed a predetermined number of buttons one by one onto the card, and means for adjusting the buttons in a row on the card in position for attachment thereto; with means for simultaneously forming a number of wire staples, means for simultaneously driving the staples through the row of buttons and card to attach them to the card, and means for clenching the staples, substantially as described.

23. In a button-feeding machine, the combination of card-feeding mechanism, a single button-feed device, mechanism for causing said device to feed a number of buttons one by one onto the card, means for automatically feeding the buttons alike as fed, and means for assembling the

buttons in a row on the card for attachment thereto; with mechanism for simultaneously forming a number of staples, mechanism for simultaneously driving the staples through the card and a row of buttons thereon to attach them to the card, and means for simultaneously clenching the staples, substantially as described.

24. In a machine for carding four-hole buttons, the combination of means for attaching buttons to cards, the fixed and movable guide-bars for turning the buttons on their axes and holding them in proper position for engagement by the fastening device, and the pivoted catches for locking the buttons in each position until secured to the card, substantially as described.

25. In a button-feeding machine the combination of means for attaching disk-shaped perforated buttons to cards, and button-feeding mechanism; with the movable bar O for turning the buttons on their axes to proper position for engagement by the fastening device, and the pivoted catches P having downwardly-bent fingers adapted to engage the perforations in the buttons and hold them in position while being stapled to the card, substantially as described.

899,568. AUTOMATIC FEEDER FOR ELECTRIC MOTORS. JOHN R. PUTMAN, Rochester, N. Y. Filed Sept. 4, 1900. Serial No. 28,287. (No model.)

Claim.—1. The combination with the electric motor, of the weighted opening-lever, the counterbalanced contact-lever, the variable resistance, the connection between the lever, suitable means driven by the motor for shifting the opening-lever in accordance with the speed of the motor and suitable electrical connections, as and for the purpose specified.

2. The combination with the electric motor, of the weighted opening-lever, the counterbalanced contact-lever, the counterweight spring with the contact-lever, the variable resistance, the electrical contacts with the contact-lever at the upper end of the resistance, the connection between the lever, suitable means driven by the motor for shifting the opening-lever in accordance with the speed of the motor, and suitable electrical connections, as and for the purpose specified.

3. The combination with the electric motor, of the weighted opening-lever, the contact-lever provided with the counterbalance placed above the pivot of the lever and adapted to hold the lever in its uppermost position, the variable resistance, the connection between the lever, suitable means driven by the motor for shifting the opening-lever in accordance with the speed of the motor, and suitable electrical connections, as and for the purpose specified.

4. The combination with the electric motor, of the opening-lever provided with the longitudinally-adjustable weight, the contact-lever provided with the counterbalance placed above the pivot of the lever and adapted to hold the lever in its uppermost position, the variable resistance, the connection between the lever, suitable means driven by the motor for shifting the opening-lever in accordance with the speed of the motor, and suitable electrical connections, as and for the purpose specified.

899,567. LAWE-COASTER. HARVEY C. KALYA, Legal, Ind., assignor of one-half to Edward B. Weston, Legal, Ind. Filed Oct. 25, 1901. Serial No. 28,728. (No model.)

Claim.—1. In a device of the character described, a movable member or part equipped with a cast, a stationary member or part extending some distance beyond said movable member, at each end, pairs of rollers or track carrying hangers or brackets, with their longitudinally-slotted portions arranged next to said stationary member and their integral upstanding arms connected to said movable member, and means adapted to provide for centering said movable member, said movable member adapted

to be moved and restricted within limits corresponding to the length of said stationary member, substantially as set forth.

2. In a device of the character described, a movable part or member, a stationary member or part extending some distance beyond said movable member, at each end, pairs of hangers or brackets, with their longitudinally-slotted portions arranged next to said stationary member and their integral upstanding arms connected to said movable member, and springs connected to said movable and stationary members at their ends, said movable member or part adapted to be moved and restricted within limits corresponding to the length of said stationary member or part, substantially as set forth.

3. In a device of the character described, a movable member or part equipped with a pivoted cast and a brace or prop connected to said member and adjustably to said cast, a stationary member or part extending some distance beyond said movable member, at each end, pairs of rollers or track carrying hangers or brackets, with their longitudinally-slotted portions arranged next to said stationary member and their integral upstanding arms connected to said movable member, and means adapted to provide for centering said movable member, said movable member adapted to be moved and restricted within limits corresponding to the length of said stationary member, substantially as set forth.

899,568. HEEL FOR BOOTS OR SHOES. JOHN S. RAY, Paterson, N. J., assignor of one-half to Robert A. Ray, Paterson, N. J. Filed May 28, 1901. Serial No. 61,992. (No model.)

Claim.—1. A heel for boots and shoes, comprising a plate for attachment to a heel or shoe, flanges on said plate, rubber blocks slightly held on said flanges and forming an unbroken tread when assembled, said blocks comprising a central block, side blocks on opposite sides of the central block and changeable one relatively to the other, a hysteresis-shaped block, corner-blocks, and a middle block between the corner-blocks, as set forth.

2. A heel for boots and shoes, comprising a plate for attachment to a heel or shoe, flanges on said plate, rubber blocks slightly held on said flanges and forming an unbroken tread when assembled, said blocks comprising a central block, side blocks on opposite sides of the central block and changeable one relatively to the other, a hysteresis-shaped block, corner-blocks, and a middle block between the corner-blocks, each of the blocks being recessed at the outer edge to form a continuous groove on the periphery of the heel, and an endless binding band or wire engaging said groove, to hold the blocks in place, as set forth.

3. A heel or shoe heel, comprising a central plate, flanges extending outwardly from the plate and in a different horizontal plane thereon, a retaining-flange on said plate, a key movable on said flange, blocks adapted to engage the flange, and a central block engaging said flange and key, as set forth.

4. A heel or shoe heel, comprising a central plate, flanges extending outwardly from the plate and in a different horizontal plane thereon, a retaining-flange on said plate, a key movable on said flange, blocks adapted to engage the flange, and a central block engaging said flange and key, one of the blocks locking said key in place, as set forth.

5. A heel for boots and shoes, comprising metallic fastenings to be secured to the bottom of the heel or shoe, a plurality of rubber blocks clustered together in a plane parallel with the bottom of the heel or shoe, and an endless metallic band completely encircling said blocks.

6. A heel for boots and shoes, comprising metallic fastenings to be secured to the bottom of the heel or shoe, a central block to engage said fastenings, a plurality of loose blocks to be clustered around said central block thus forming a flat member disposed parallel with the bottom of the heel or shoe, and having the general conformity of a shoe-heel, a band

surrounding said flat member thus formed, and fastenings for holding said blocks in registry with each other.

7. A heel for boots and shoes, comprising metallic fastenings to be secured to the bottom of the boot or shoe, a central block for engaging said fastenings, a plurality of blocks of substantially cubical shape to be clustered around said central block thus forming a flat member disposed parallel with the bottom of the boot or shoe, means for securing said blocks in position, and an external band completely encircling all of said blocks for the purpose of holding them together.

699,569. LACING-BUTTON. WILLIAM KIMBROW, Chicago, Ill. Filed Jan. 4, 1900. Serial No. 21,671. (No model.)

Claim.—1. In combination with an eyelet, a stud consisting of a head having a hollow stem projecting from its under side, said stem being of such a size that it will rest against said eyelet without passing therethrough, a shank having a head of larger size than the eyelet-hole and a stem which is adapted to pass through the eyelet and into said hollow stem, the diameter of said shank-stem being greater than the internal diameter of said hollow stem, so that when one stem is forced into the other the shank and top may be permanently held together by the frictional engagement between the stems, and they may engage opposite sides of the eyelet as so to be firmly held thereby.

2. In combination with an eyelet, a stud having a hollow stem projecting from its under side, an annular enlargement on the outer side of said stem and near its end which is adapted to rest against the outer face of said eyelet, the portion of said stem beyond said enlargement being adapted to fit said eyelet but not extend entirely therethrough, a shank having a head which is adapted to rest against the inner face of said eyelet, a stem which extends therefrom and is adapted to pass through said eyelet into said hollow stem, the diameter of said shank-stem being slightly greater than the internal diameter of said hollow stem, so that when the one is forced into the other the two will be held together firmly by frictional engagement, and the ends of the hollow stem may be expanded against the sides of the eyelet, said shank-stem being forced into said hollow stem a sufficient distance to cause said shank and the flange of the top to be firmly engaged opposite sides of the eyelet.

699,570. AIR-COMPRESSOR. GEORGE W. BROWN, ALBANY, N. Y. Filed Jan. 4, 1902. Serial No. 21,665. (No model.)

Claim.—1. In an air-compressor, the combination with a stationary disk, of an annular air-chamber surrounding the disk, an annular casing between the disk and air-chamber, a series of pump-cylinders supported within the casing, a revolvable shaft extending loosely through the disk, which fixed upon the shaft on opposite sides of the disk grooved cams secured to the inner side of the wheels, and pump-pistons provided with rollers adapted to travel within the grooves of the cams.

2. In an air-compressor, the combination with a stationary disk, of an annular air-chamber surrounding the disk, an annular casing between

the disk and air-chamber, a series of pump-cylinders supported within the casing and communicating with the air-chamber, a piston and piston-rod for each cylinder, a roller on each piston-rod, a revolvable shaft extending through said disk, which fixed upon the shaft on opposite sides of the disk, grooved cams secured to the inner side of the wheels to receive said rollers, means for guiding the movement of the pistons, and means for cooling the cylinders.

3. In an air-compressor, the combination with a stationary disk having radially-disposed guideways on the opposite sides of the disk, of pump-cylinders arranged on opposite sides of the vertical center of the disk, a piston and piston-rod for each cylinder, said piston-rods working in the guideways and means for reciprocating the pistons.

4. In an air-compressor, the combination with a stationary disk, of an annular air-chamber surrounding the periphery of the disk and having a lower extension forming a hollow basin, an annular casing interposed between the disk and air-chamber and secured thereto, a series of air-pumps disposed radially in parallel pairs, a revolvable shaft extending loosely through the center of the disk, which fixed upon said shaft one at each side of the disk, a grooved cam secured to the inner side of each of said wheels, and rollers mounted upon the piston-rods of the pumps and extending into the grooves of said cams.

5. In an air-compressor, the combination with a stationary disk having a central hub, of an annular casing secured to the periphery of said disk, an annular air-chamber secured to the outer side of the casing, a series of air-pumps arranged in radial pairs and supported within the casing, a revolvable shaft extending loosely through said hub which mounted on said shaft, a hollow basin below the air-chamber having an oil-reservoir, pipe connections between said oil-reservoir and the cylinders of the pumps and means carried by the wheels for reciprocating the pump-pistons.

6. In an air-compressor, the combination with a stationary disk having a central hub, of an annular casing secured to the periphery of said disk, an annular air-chamber secured to the outer side of the casing, a series of air-pumps arranged in radial pairs and supported within the casing, a revolvable shaft extending loosely through the hub, which mounted on said shaft, grooved cams carried by the wheels, rollers on the piston-rods of the pumps extending into the grooves of said cams, an oil-reservoir, circular pipes connected with said reservoir, and intake-pipes connecting the circular pipes with the pump-cylinders.

7. In an air-compressor, the combination with a stationary disk having a central hub and radially-arranged guideways, of a revolvable shaft extending loosely through said hub, which fixed upon said shaft one at each side of the disk, grooved cams secured to said wheels, a series of radially-disposed air-pumps supported on opposite sides of the vertical center of the disk, a series of rollers mounted on the piston-rods of the pumps and extending into the guideways of the disk.

8. In an air-compressor, the combination with an air-chamber, of a series of air-pumps all communicating with the air-chamber, and each comprising a cylinder open at its ends, a piston having a valve opening, and means for connecting the cylinder to the air-chamber consisting of a tubular coupling, and a valve-casing containing an automatically-closing valve, said valve-casing having air-inlet ports, controlled by a disk.

9. In an air-compressor, the combination with a stationary disk, of an annular casing secured thereto, an annular air-chamber secured to the casing, a series of radially-disposed air-pumps each comprising a cylinder open at its ends, a piston and piston-rod, means for connecting the cylinder to the casing consisting of a coupling having air-ports controlled by a valve, and means for connecting the cylinder to the air-chamber consisting of a tubular coupling and a valve-casing containing an air-closing valve, said valve-casing having air-inlet ports controlled by a disk.

10. In an air-compressor, the combination with a stationary disk having a central hub, of a revolvable shaft extending loosely through said hub, which fixed upon said shaft one at each side of the disk, grooved cams carried by said wheels, an annular water-casing surrounding the disk and secured thereto, pipes for supplying water to said casing, a series of air-pumps arranged radially in pairs within said water-casing, rollers mounted on the piston-rods of the pumps and extending into the grooves of the cams, and an annular air-chamber surrounding the water-casing into which all of said pumps deliver air.

699,571. PROCESS OF REFINING OIL. RICHARD BROWN, Birmingham, France. Filed July 12, 1900. Serial No. 21,661. (No specification.)

Claim.—1. The herein-described method of refining oil, which consists in causing a current of oil and a current of steam to move in opposite directions and causing the current of steam in two jets to pass upwardly through the current of oil at a plurality of points, and in maintaining the steam against condensation throughout its travel, substantially as set forth.

2. The herein-described method of refining oil, which consists in causing the oil to flow in one direction, but stop by stop from one collecting-point to another successively, simultaneously causing a current of steam to flow in the opposite direction from one of said oil-collecting-points to another successively, the steam passing in a finely-divided condition through the oil at said collecting-points, and applying heat at said collecting-points to prevent undue condensation, substantially as set forth.

699,572. APPARATUS FOR REFINING OIL. RICHARD BROWN, Birmingham, France. Original application filed July 12, 1900, Serial No. 21,661. Divided and this application filed Dec. 10, 1901. Serial No. 21,395. (No model.)

Claim.—1. An apparatus for refining oil with the aid of steam, the same comprising a series of connected oil-receivers having an inlet for admitting oil to the receiver at one end of the series and an inlet for admitting steam to the receiver at the other end of the series, each receiver having a perforated plate near its bottom and above the steam-inlet to the receiver whereby the steam is broken up into jets, and having also in it a closed steam-coil for maintaining the temperature of the matter treated.

2. An apparatus for refining oil with the aid of steam, the same comprising a series of connected oil-receivers having an inlet for oil and an outlet for steam at one end of the series and an inlet for steam and an

outlet for oil at the other end of the series, the inlet for steam being at the bottom of each receiver, and each receiver having a perforated plate above the steam-inlet and a steam-coil below said plate, substantially as and for the purpose set forth.

699,573. TRACK-SWAPPER ATTACHMENT FOR STREET-RAILWAY CARS. FRED H. ROSS, Kalamazoo, Mich. Filed Dec. 21, 1901. Serial No. 21,776. (No model.)

Claim.—1. The combination of the rock-shaft B; connections for adjusting the same; springs E curved upwardly and rearwardly and downwardly secured to the said rock-shaft, the upper portions of said springs being deflected inward; diagonal couplers F secured to the rear and lower ends of said springs; and auxiliary spring-couplers I having adjustable shoes J secured to said rock-shaft and adapted to rest upon the rails, for the purpose specified.

2. The combination of the rock-shaft B; connections for adjusting the same; springs E curved upwardly and rearwardly and downwardly secured to the said rock-shaft, the upper portions of said springs being deflected inward; diagonal couplers F secured to the rear and lower ends of said springs and auxiliary spring-couplers I secured to said rock-shaft, for the purpose specified.

3. The combination of the rock-shaft B; connections for adjusting the same; springs E curved upwardly and rearwardly and downwardly secured to the said rock-shaft, the upper portions of said springs being deflected inward; diagonal couplers F secured to the rear and lower ends of said springs, for the purpose specified.

4. The combination of the rock-shaft B; connections for adjusting the same; springs E curved upwardly and rearwardly and downwardly secured to the said rock-shaft; diagonal couplers F secured to the rear and lower ends of said springs, for the purpose specified.

5. A swapper for street-railways carried on a suitable yielding spring; an auxiliary swapper independently supported to the rear of and extending below the bottom of the same and adapted to yield independent of the main swapper.

699,574. TELEGRAPHIC DISTRIBUTION. BENJAMIN H. BOW-LAND, Baltimore, Md., administrator of Henry A. Bowland, deceased, assignor to Bowland Telegraphic Company, Baltimore, Md., a Corporation of New Jersey. Filed July 24, 1901. Serial No. 21,694. (No model.)

paper-supporting carriage, of a spacing-rod located near said carriage, an electromagnet for imparting lateral reciprocating motion to said rod, operative connection between said carriage and said rod whereby the reciprocating motion of the rod imparts a step-by-step motion to the carriage, means for retaining the spacing-rod for releasing the operative connection between said carriage and said rod, and means for shifting the carriage in a direction opposite to that in which it is sent by said rod.

3. In a printing-machine, the combination with a laterally-movable paper-supporting carriage, of spacing-rod located near said carriage, means for imparting lateral reciprocating motion to one of said rods, operative connection between said carriage and said rod whereby the reciprocating motion of one of said rods imparts a step-by-step motion to the carriage, means for retaining the operative connection between the carriage and said rod by the operation of said rod, and means for shifting the carriage in a direction opposite to that in which it was sent by the said rod.

4. In a printing-machine, the combination with a printing mechanism, of a laterally-movable paper-supporting carriage, spacing-rod located near said carriage, means for imparting lateral reciprocating motion to one of said rods after the printing of each character, operative connection between said carriage and said rod whereby the reciprocating motion of one of said rods imparts a step-by-step motion to said carriage, means for retaining said rod for releasing the operative connection between the carriage and said rod, and means for shifting the carriage in a direction opposite to that in which it was sent by the said spacing-rod.

5. In a printing-machine, the combination with a laterally-movable paper-supporting carriage, of spacing-rod located near said carriage, an electromagnet for imparting lateral reciprocating motion to one of said rods, means for automatically energizing said magnet, operative connection between said carriage and said rod whereby the reciprocating motion of one of said rods imparts a step-by-step motion to the carriage, means for releasing the operative connection between the carriage and said rod by the operation of said rod, and means for shifting the carriage in a direction opposite to that in which it was sent by the spacing-rod, substantially as described.

6. In a printing-machine, the combination with a laterally-movable paper-supporting carriage, of toothed spacing-rod located near said carriage, means for imparting lateral reciprocating motion to one of said rods, pawls mounted upon said carriage and adapted to engage the teeth of said rod, whereby the reciprocating motion of one of said rods imparts a step-by-step motion to said carriage, means for retaining said rods whereby the teeth thereof are disengaged from said pawls, and means for shifting the carriage in a direction opposite to that in which it was sent by the said spacing-rod after the pawls have been so released.

7. In a printing-machine, the combination with a laterally-movable paper-supporting carriage, of spacing-rod located near said carriage, means for imparting lateral reciprocating motion to one of said rods, operative connection between said carriage and said rod whereby the reciprocating motion of one of said rods imparts a step-by-step motion to said carriage, an electromagnet, an armature operated by said magnet and adapted to rotate said spacing-rod and thereby release the operative connection between the said rods and said carriage, and means for shifting the carriage in a direction opposite to that in which it was sent by the said spacing-rod, substantially as described.

8. In a printing-machine, the combination with a laterally-movable paper-supporting carriage, of toothed spacing-rod located near said carriage, means for imparting lateral reciprocating motion to one of said rods, pawls carried by said carriage and adapted to engage the teeth of said rod, a pinion carried by each of said rods, a rack engaging both of said pinions, an electromagnet adapted to shift said rack whereby the teeth of said rods are disengaged from said pawls, and means for shifting the carriage in a direction opposite to that in which it is sent by the spacing-rod, substantially as described.

9. In a printing-machine, the combination with a horizontal shaft, of a sleeve adapted to slide on said shaft, a paper-supporting carriage suspended from said sleeve, spacing-rod located near said carriage, means for imparting lateral reciprocating motion to one of said rods, operative connection between said carriage and said rod whereby the reciprocating motion of one of said rods imparts a step-by-step motion to the said carriage, means for retaining the operative connection between said carriage and said rod by the operation of said rod, and means for shifting the said carriage in a direction opposite to that in which it is sent by the said spacing-rod, substantially as described.

10. In a printing-machine, the combination with a horizontal shaft, of a sleeve adapted to slide upon said shaft, a paper-supporting carriage suspended from said sleeve, toothed spacing-rod located near said carriage, means for imparting lateral reciprocating motion to one of said rods, pawls mounted upon said carriage and adapted to engage the teeth of the said rod, means for retaining said rods whereby the teeth thereof are disengaged from said pawls and means for shifting the carriage in a direction opposite to that in which it is sent by the said spacing-rod, substantially as described.

11. In a printing-machine, the combination with a laterally-movable paper-supporting carriage, of toothed spacing-rod located near said carriage, means for imparting lateral reciprocating motion to one of said rods, pawls carried by said carriage and adapted to engage the teeth of said rod, electromagnetically-operated means for rotating said rods whereby the teeth thereof are disengaged from said pawls, an electrical contact carried by one of said rods, and an electrical contact carried by the said carriage, the said contact on the said rod being shifted into alignment with the contact on the said carriage upon the rotation of the said rod and means for shifting the carriage in a direction opposite to that in which it was sent by the said spacing-rod, whereby the electrical contact on the said carriage is brought into engagement with the contact carried by the said rod, an electric circuit completed by the said contacts and a relay operated by the said circuit for restoring the electromagnet means for rotating the said spacing-rod to its normal position, substantially as described.

12. In a printing-machine, the combination with a laterally-movable paper-supporting carriage, of a spacing-rod located near said carriage, means for imparting lateral reciprocating motion to said rod, operative connection between said carriage and said rod whereby the reciprocating motion of said rod imparts a step-by-step motion to said carriage, means for retaining said rod for releasing the operative connection between said carriage and said rod, a spring-controlled wheel and flexible connection between said wheel and said carriage for shifting the said carriage in a direction opposite to that in which it is sent by the said spacing-rod, substantially as described.

13. In a printing-machine, the combination with a laterally-movable paper-supporting carriage, of toothed spacing-rod located near said carriage, means for imparting lateral reciprocating motion to one of said rods, pawls carried by said carriage and adapted to engage the teeth of said rod, whereby the reciprocating motion of one of said rods imparts a step-by-step motion to said carriage, means for retaining said rods for releasing the pawls from engagement with the teeth of said rod, a spring-controlled wheel and flexible connection from said wheel to said carriage for shifting the said carriage in a direction opposite to that in which it is sent by the said spacing-rod, substantially as described.

14. In a printing-machine, the combination with a laterally-movable paper-supporting carriage, of spacing-rod located near said carriage, means for imparting lateral reciprocating motion to one of said rods, pawls carried by said carriage and adapted to engage the teeth of said rod, whereby the reciprocating motion of one of said rods imparts a step-by-step motion to said carriage, means for retaining said rods for releasing the operative connection between said carriage and said rod, and means for shifting the said carriage in a direction opposite to that in which it is sent by the said spacing-rod, substantially as described.

15. In a printing-machine, the combination with a laterally-movable paper-supporting carriage, of spacing-rod located near said carriage, means for imparting lateral reciprocating motion to one of said rods, pawls carried by said carriage and adapted to engage the teeth of said rod, whereby the reciprocating motion of one of said rods imparts a step-by-step motion to said carriage, means for retaining said rods for releasing the operative connection between said carriage and said rod, and means for shifting the said carriage in a direction opposite to that in which it is sent by the said spacing-rod, substantially as described.

16. In a printing-machine, the combination with a laterally-movable paper-supporting carriage, of spacing-rod located near said carriage, means for imparting lateral reciprocating motion to one of said rods, pawls carried by said carriage and adapted to engage the teeth of said rod, whereby the reciprocating motion of one of said rods imparts a step-by-step motion to said carriage, means for retaining said rods for releasing the operative connection between said carriage and said rod, and means for shifting the said carriage in a direction opposite to that in which it is sent by the said spacing-rod, substantially as described.

17. In a printing-machine, the combination with a laterally-movable paper-supporting carriage, of spacing-rod located near said carriage, means for imparting lateral reciprocating motion to one of said rods, pawls carried by said carriage and adapted to engage the teeth of said rod, whereby the reciprocating motion of one of said rods imparts a step-by-step motion to said carriage, means for retaining said rods for releasing the operative connection between said carriage and said rod, and means for shifting the said carriage in a direction opposite to that in which it is sent by the said spacing-rod, substantially as described.

18. In a printing-machine, the combination with a laterally-movable paper-supporting carriage, of spacing-rod located near said carriage, means for imparting lateral reciprocating motion to one of said rods, pawls carried by said carriage and adapted to engage the teeth of said rod, whereby the reciprocating motion of one of said rods imparts a step-by-step motion to said carriage, means for retaining said rods for releasing the operative connection between said carriage and said rod, and means for shifting the said carriage in a direction opposite to that in which it is sent by the said spacing-rod, substantially as described.

19. In a printing-machine, the combination with a laterally-movable paper-supporting carriage, of spacing-rod located near said carriage, means for imparting lateral reciprocating motion to one of said rods, pawls carried by said carriage and adapted to engage the teeth of said rod, whereby the reciprocating motion of one of said rods imparts a step-by-step motion to said carriage, means for retaining said rods for releasing the operative connection between said carriage and said rod, and means for shifting the said carriage in a direction opposite to that in which it is sent by the said spacing-rod, substantially as described.

section from said wheel to said body for shifting the same in a direction opposite to that in which it is sent by the said spacing-rod.

699,576. SIGNAL-LANTERN. C. A. R. BAKER, St. Louis, Mo., assignor of one-half to R. E. R. Green, Terrell, Tex. Filed Aug. 9, 1901. Serial No. 71,001. (No model.)

Claim.—1. The combination with a rotatable signal-lantern, of a slot formed in the bottom of said lantern between the axis of rotation and the side of the lantern, a stationary gas-supply pipe projecting through said slot, and a shield carried by said supply-pipe and closing said slot.

2. In a signal-lantern, the combination with a lantern-body, of a movable top carried by said body, and an opening in said top adapted to be put into communication with the atmosphere by the movement of said top.

3. In a signal-lantern, the combination with a lantern-body, of a movable top carried by said body, an opening in said top adapted to be put into communication with the atmosphere by the movement of said top, and a spring for returning said top to its normal position.

4. In a signal-lantern, the combination with a lantern-body, of a flange carried at the top of said body, a movable lantern-top projecting into said body and provided with openings adapted to be put into communication with the atmosphere by the movement of said top, and a flange carried by said top and resting on the flange on said body.

5. In a signal-lantern, the combination with a lantern-body, of a flange carried by said body, a movable top projecting into said body and provided with openings adapted to be put into communication with the atmosphere by the movement of said top, a flange carried by said top and resting on the flange on said body, and a spring for returning said top to its normal position.

699,577. PROJECTILE AND TIME-FUSE THEREFOR. WILHELM KRAUS, Bamberg, Germany. Filed Jan. 2, 1902. Serial No. 90,321. (No model.)

Claim.—1. In a time-fuse for projectiles, a fuse-holder arranged in the direction of the axis of the projectile, a time-fusing composition extending in the direction of the axis of the projectile and arranged in said holder, a band extending in the holder surrounding said composition and provided with a hole for the passage of fire from said composition when it is ignited, and a time-fusing composition arranged in said holder and adapted to be ignited by the passage of fire from the time-fusing composition through the opening in said band.

2. In a time-fuse for projectiles, a fuse-holder arranged in the direction of the axis of the projectile, a time-fusing composition extending in the direction of the axis of the projectile and arranged in said holder, an adjustable band extending in the holder surrounding said composition and provided with a hole for the passage of fire from said composition when

it is ignited, and a time-fusing composition arranged in said holder and adapted to be ignited by the passage of fire from the time-fusing composition through the opening in said band.

3. In a fuse for projectiles, a time-fusing composition and a time-fusing composition suitably arranged within the projectile, a band surrounding the time-fusing composition for separating the same from the time-fusing composition, said band provided with an opening to permit of the passage of fire from the time-fusing composition to the time-fusing composition, and means for igniting the time-fusing composition.

4. In a fuse for projectiles, a time-fusing composition and a time-fusing composition suitably arranged within the projectile, an adjustable band surrounding the time-fusing composition for separating the same from the time-fusing composition, said band provided with an opening to permit of the passage of fire from the time-fusing composition to the time-fusing composition, and means for igniting the time-fusing composition.

5. In a fuse for projectiles, a time-fusing composition and a time-fusing composition suitably arranged within the projectile, a band surrounding the time-fusing composition for separating the same from the time-fusing composition, said band provided with an opening to permit of the passage of fire from the time-fusing composition to the time-fusing composition, means for adjusting the said band, and means for igniting the time-fusing composition.

6. In combination with a projectile, a compressed powder-strip suitably arranged therein and extending in the direction of the axis of the projectile, a band surrounding the said strip and provided with an opening for the passage of fire therefrom, a conical mass of combustible material arranged in the projectile and extending in the direction of the axis thereof and adapted to be ignited by the passage of fire through said opening in said band, and means for igniting the said strip.

7. In combination with a projectile, a time-fusing composition arranged therein, a time-fusing composition arranged in the projectile and adapted to be ignited by said time-fusing composition, means for igniting the latter, means extending in the projectile and separating the time-fusing composition from the time-fusing composition and provided with an opening to permit of the passage of fire from the time-fusing composition to the time-fusing composition when the former is ignited.

8. In combination with a projectile, a time-fusing composition arranged therein and extending in the direction of the axis thereof, a time-fusing composition arranged in the projectile and extending parallel with the time-fusing composition, means for igniting the time-fusing composition, and means arranged in the projectile to permit of the passage of fire from the time-fusing composition to the time-fusing composition.

9. In combination with a projectile, of a holder arranged therein and extending in the direction of the axis thereof, said holder communicating by an opening at its lower end with the explosion-chamber of the projectile, a time-fusing composition arranged in the said holder, a time-fusing composition arranged in said holder and communicating with the opening in the bottom thereof, means for igniting the time-fusing composition, and means extending in the holder for separating the time-fusing composition from the time-fusing composition and to permit of the passage of fire from the time-fusing composition to the time-fusing composition for igniting the latter.

10. In combination with a projectile, a time-fusing composition strip arranged therein, a conical mass of combustible material arranged in the projectile, an adjustable band extending between the said mass and strip and provided with an opening to permit of the passage of fire from said strip to said mass, and means connected with the projectile to permit of suitably adjusting the said band.

11. In combination with a projectile, a time-fusing composition arranged therein, a time-fusing composition arranged parallel with the time-fusing composition, both of the said compositions extending in the direction of the axis of the projectile, and means for adjusting the burner period of said time-fusing composition, the displacement of the said means being effected parallel to the longitudinal axis of the projectile.

699,578. GAS-BURNER FOR FIRING BARRICA. HENRY C. BAKER, St. Louis, Mo. Filed Dec. 7, 1901. Serial No. 90,307. (No model.)

Claim.—1. In a barrel-loading apparatus, the combination with a barrel-support, of a burner projecting above the support and located within a barrel placed upon said support, a supply-pipe leading to the burner, a valve controlling the passage-way through the pipe, and operating means for the valve connected thereto and normally projecting above the barrel-support, said means being engaged and moved by a barrel when placed upon said support.

2. In barrel-loading apparatus, the combination with a barrel-supporting platform, of a burner arranged above the platform and located within a barrel placed on said platform, a supply-pipe leading to the burner, a valve controlling the passage-way through the pipe, and a valve-operating arm extending across the platform and having a connection with the valve, said arm being moved by a barrel when placed upon the platform.

3. In barrel-heating apparatus, the combination with a barrel-support, of a burner, a supply-pipe leading to the burner, a valve controlling the passage-way through the pipe, and a valve-operating arm hinged at one end to the support and extending across the upper face of the same, said arm having a connection at its free end with the valve, and being moved by a barrel placed upon the platform.

4. In barrel-heating apparatus, the combination with a barrel-support having a groove, of a burner projecting above the platform and having a valve, and an operating-arm for the valve connected thereto and located at one end of and below the burner, said arm being movable in the groove of the support.

5. In barrel-heating apparatus, the combination with a platform having a depressed barrel-rest, said rest being provided with a groove, of a burner, a valve for the burner, and an operating-arm for the valve pivoted to the platform at the inner end of the groove and located in the groove of the rest, said arm being connected at its outer end to the valve.

6. In barrel-heating apparatus, the combination with a barrel-supporting platform, of a burner located upon the platform, said burner comprising a body that tapers toward its lower end and having openings in its side walls, said body constituting a deflector to throw the heat against the side of a barrel placed thereover.

7. In barrel-heating apparatus, the combination with a barrel-support and burner, of a cover for the barrel comprising spaced facing-plates, and barrel-engaging devices for supporting the plates in spaced relation to the barrel-walls to permit the escape of the products of combustion.

8. In barrel-heating apparatus, the combination with a barrel-support, of a burner, a deflector for the barrel comprising spaced facing-plates, and upwardly and outwardly projecting barrel-engaging hooks secured to one of the plates.

9. In barrel-heating apparatus, the combination with a barrel-supporting platform, of a burner located thereon and disposed within a barrel placed upon the platform, and a deflector arranged to be supported within the barrel and spaced from the walls thereof to allow the heat to escape only about the edges of said cover.

10. In barrel-heating apparatus, the combination with a barrel-supporting platform, of a burner comprising inner and outer conical walls spaced from each other and moved together at their outer peripheral edges, the inner conical wall being open at its base, and a deflector arranged to be supported within a barrel in spaced relation to the walls thereof.

11. In a barrel-heating apparatus, the combination with a barrel-supporting platform, of a burner located upon the platform and comprising inner and outer conical walls spaced apart from each other and secured together at their outer peripheral edges, said edges being arranged upwardly, and the inner conical wall being open at its base.

12. In a barrel-heating apparatus, the combination with a barrel-support, of a burner located upon an intermediate portion of the support, barrel-positioning means arranged upon the support in spaced relation to the burner, a controlling-valve for the burner, and actuating means for the valve connected thereto and arranged contiguous to the barrel-positioning means, whereby said actuating means will be moved by a barrel placed upon the support and in coacting relation with the positioning means.

699,579. **BRAKE** HENRY L. SHAFER, Florence, Italy. Filed Oct. 24, 1901. Serial No. 78,000. (No model.)

Claim.—1. The combination of the wheel, brake-levers pivoted on opposite sides thereof, and brake-chains carried by said levers; with a connection composed of a short and a long member respectively connected to the free ends of the opposite levers, the joint between one member of the connection and one lever being adjustable, and means for extending the connection, substantially as described.

2. The combination of the wheel, the brake-levers pivoted on op-

posite sides thereof, the stops for limiting the releasing movement of the levers, the link pivoted to one lever, a rod pivotally connected to the link and transmitting the other lever, an adjusting-rod on the rod, a spring interposed between the rod and lever, a pull connected to the link, and a spring for separating the levers, substantially as described.

3. The combination of the wheel, the clamps on opposite sides thereof, the brake-levers pivoted on the clamps limiting the releasing movement of the levers, the brake-chains attached to the levers above their pivots, a link pivoted to one lever, an adjustable rod pivotally connected to the link and connecting it with the other lever, and a spring for separating the levers, substantially as described.

699,580. **SARKIS-FASTNER** JAMES H. SHIVERS, Cleveland, Ohio. Filed June 15, 1901. Serial No. 84,706. (No model.)

Claim.—In a cash-fastener, the combination with the base-plate having side and front walls, of the locking dog or member pivoted between the side walls, a locking or latching block sliding upon the base-plate between the side walls, and a screw passing through the front wall and adapted to engage the locking or latching block for the purpose of moving the same into or out of engagement with the pivotal end of the locking dog or member, substantially as described.

699,581. **INDIGO-DIAZOTIC ACID AND PROCESS OF MAKING SAME** PAUL SEIGEL, Ludwigshafen, Germany, assignor to Badische Anilin & Soda Fabrik, Ludwigshafen, Germany, a Corporation of Baden. Filed Feb. 28, 1901. Serial No. 48,578. (Specimens.)

Claim.—1. The process of making indigo-diazotie acid which consists in treating anthranilic acid with two (2) molecular proportions of mono-haloid-acetic acid and then treating this product successively with caustic alkali, water and air.

2. The process of making indigo-diazotie acid which consists in treating anthranilic-acetic acid successively with caustic alkali, water, and air.

3. The process of making indigo-diazotie acid which consists in treating indoxyl-acetic-carboxylic acid in the presence of caustic alkaline solution with air.

4. The process of making indigo-diazotie acid which consists in treating anthranilic acid successively with mono-haloid-acetic acid, caustic alkali, water, and air.

5. The process of making indigo-diazotie acid which consists in treating anthranilic acid successively with mono-chlor-acetic acid, caustic potash, water, and air.

6. As a new article of manufacture the new indigo coloring-matter, namely, indigo-diazotie acid which is soluble in hot water yielding crystals upon cooling, which upon heating melts and decomposes and which is readily soluble in alcohol and in ether, substantially as described.

699,582. **ISSEAL APPARATUS** SAMUEL C. SHAFER, Hobbs, Ala. Filed Jan. 9, 1902. Serial No. 90,002. (No model.)

Claim.—1. In a signal apparatus, the combination with the electric street-lighting system, of the street telephone or signal system, and a switch operated by the latter for affecting the former.

2. In a signal apparatus, the combination with the electric street-lighting system, of the street telephone or signal system, and a switch op-

erated by the latter for affecting the former, and mechanical means for resetting the switch.

3. In a signal apparatus, the combination with the electric street-lighting system, a street signal-box, an electrically-operated switch therein for affecting the street-lighting system, and a mechanical connection between said box and switch for resetting the latter.

4. In a signal apparatus, the combination with the electric street-lighting system, a street signal-box, an electrically-operated switch therein for affecting the street-lighting system, and a mechanism controlled by the opening of the box-door for resetting the switch.

5. In a signal apparatus, the combination with the street-lighting system, a street signal-box, an electrically-operated switch therein, controlling mechanism for said switch, a street-lamp in the street-check, a signal-lamp in check therewith, electrical connections between said switch and signal-lamp so that the operation of the switch will extinguish the street-lamp and ignite the signal-lamp, and mechanical connections between said box and switch for resetting the latter.

6. In a signal apparatus, the combination with the street-lighting system, a central office, the street-signal controlled therefrom, a series of street signal-beams thereon, switches within the beams electrically operated from the central office, the said switches affecting the street-lighting system, and mechanical connections between said beams and switches for resetting the latter.

7. In a signal apparatus, the combination with the street-lighting system, a central office, a two-wire street signal system controlled therefrom, a series of street signal-beams, some of said beams being connected with one wire and the other wire and the ground, and other beams being connected with both wires, switches within the beams electrically operated from the central office, the said switches affecting the street-lighting system, and mechanical connections between said beams and switches for resetting the latter.

8. In a signal apparatus, the combination with the street-lighting system, a central office, a two-wire street signal system controlled therefrom, a series of street signal-beams, some of said beams being connected with the first wire and the ground, other of said beams being connected with the second wire and the ground, and the remainder being connected with both wires, switches within the beams electrically operated from the central office, the said switches affecting the street-lighting system, and mechanical connections between said beams and switches for resetting the latter.

9. In a signal apparatus, the combination with the street-lighting system, a central office, a two-wire street signal system controlled therefrom, a series of street signal-beams, some of said beams being connected with the first wire and the ground, other of said beams being connected with the second wire and the ground, and the remainder being connected with both wires, switches within the beams electrically operated from the central office, the said switches affecting the street-lighting system, and mechanical connections between said beams and switches for resetting the latter.

10. In a signal apparatus, the combination with the street-lighting system, a central office, a street signal system controlled therefrom, a series of street signal-beams thereon, switches within the beams for affecting the street-lighting system, a polarized actuating device for each switch in circuit with the street-signal system, a condenser in each box, means for passing a suitable actuating-current of electricity over the signal system for energizing the actuating device, and mechanical connections between each box and switch for resetting the latter.

11. In a signal apparatus, the combination with the street-lighting system, a central office, a street signal system controlled therefrom, signal-beams thereon, a switch and an audible alarm within the box, both being electrically operated from the central office, the said switch affecting the lighting system, and mechanical connections between said box and switch for resetting the latter.

12. In a signal apparatus, a signal-box, a door, a switch, the said switch having a movable arm, a latch, electrically-operated means for actuating the latch to release the arm, and mechanical connections actuated by the door for returning the arm to engagement with the latch.

13. In a signal apparatus, a signal-box, a door, a switch, the said switch having a movable arm, a latch, electrically-operated means for actuating the latch to release the arm, a rod actuated by the door having an offset or lug for returning the arm to engagement with the latch.

14. In a signal apparatus, a signal-box, a door thereon, a switch-box, a switch thereover, said switch having a movable arm, and an electrically-operated latch therefor, and mechanical connections between said box-door and switch-arm for returning it to engagement with the latch.

15. In a signal apparatus, a signal-box, a door thereon, a switch-box, a switch thereover, said switch having a movable arm and an electrically-operated latch therefor, a movable rod connecting the two boxes, and engaging with the switch-arm, and a bell-crank lever within the signal-box actuated by the door of the latter.

16. In a signal apparatus, the combination with the street-lighting system, a street signal-box, a switch therein for affecting the street-lighting system, a latch for holding the switch in signaling inoperative position, polarized means for tripping the latch, and mechanical means for resetting the switch.

699,583. **MEANS FOR AUTOMATIC CONTROL OF MOTOR-VEHICLES** HENRY E. SHAFER, Pasadena, Cal. Filed Nov. 6, 1901. Serial No. 81,170. (No model.)

Claim.—1. In a motor-vehicle, the combination with a movable seat and a plunger device operated thereby, of means for causing the said plunger device to press against the said seat, means for regulating the above-said means, means for guiding the said plunger device, means for keeping the plunger device from turning, and means connected to and actuated by the said plunger device to turn on the power when the plunger device is depressed and to automatically shut off the power when the plunger device is raised, substantially as set forth.

2. In a motor-vehicle, the combination with a movable seat and a plunger device operated thereby, of means for causing the said plunger device to press against the said seat, means for regulating the above-said means, means for guiding the said plunger device, means for keeping the plunger device from turning, means connected to and actuated by the said plunger device to turn on the power when the plunger device is depressed and to automatically shut off the power when the plunger device is raised, and means independent of the seat for holding the plunger device down in operative position, substantially as set forth.

3. In a motor-vehicle, the combination with a movable seat and a plunger device operated thereby, of means for causing the said plunger device to press against the said seat, means for regulating the aforesaid means, means for guiding the said plunger device, means for keeping the plunger device from turning, means connected to and actuated by the said plunger device to turn on the power when the plunger device is depressed and to automatically shut off the power when the plunger device is raised, means independent of the seat for holding the plunger device down in operative position, and means connected to and actuated by the said plunger device to operate a brake, substantially as set forth.

4. In a motor-vehicle, the combination with a movable seat and a plunger device operated thereby, of means for causing the said plunger device to press against the said seat, means for regulating the aforesaid means, means for guiding the said plunger device, means for keeping the plunger device from turning, means connected to and actuated by the said plunger device to turn on the power when the plunger device is depressed and to automatically shut off the power when the plunger device is raised, means independent of the seat for holding the plunger device down in operative position, means connected to and actuated by the said plunger device to operate a brake, and means for locking the seat when the same is raised, substantially as set forth.

5. In a motor-vehicle, the combination with a movable seat and a tubular casing attached to the seat-frame, of a plunger device passing through the casing and bearing upon and actuated by the said seat, a spring within the said casing to keep the plunger against the seat, means for varying the tension on said spring, means for adjusting the length of the said plunger device, and means connected to and actuated by the said plunger device to connect the power with the motor when the plunger device is depressed and to disconnect the power from the motor when the plunger device is raised, substantially as set forth.

6. In a motor-vehicle, the combination with a movable seat and a tubular casing attached to the seat-frame, of a plunger device passing through the said casing and bearing upon and actuated by the said seat, a spring within the said casing to keep the plunger against the seat, means for varying the tension on said spring, means for adjusting the length of the said plunger device, means for keeping the plunger device from turning, and means connected to and actuated by the said plunger device to connect the power with the motor when the plunger device is depressed and to disconnect the power from the motor when the plunger device is raised, substantially as set forth.

7. In a motor-vehicle, the combination with a movable seat and a tubular casing attached to the seat-frame, of a plunger device passing through the said casing and bearing upon and actuated by the said seat, a spring within the said casing to keep the plunger against the seat, means for varying the tension on said spring, means for adjusting the length of the said plunger device, means for keeping the plunger device from turning, means connected to and actuated by the said plunger device to connect the power with the motor when the plunger device is depressed and to disconnect the power from the motor when the plunger device is raised, and means independent of the seat for holding the plunger device down in operative position, substantially as set forth.

8. In a motor-vehicle, the combination with a movable seat and a tubular casing attached to the seat-frame, of a plunger device passing through the said casing and bearing upon and actuated by the said seat, a spring within the said casing to keep the plunger against the seat, means for varying the tension on said spring, means for adjusting the length of the said plunger device, means for keeping the plunger device from turning, means connected to and actuated by the said plunger device to connect the power with the motor when the plunger device is depressed and to disconnect the power from the motor when the plunger device is raised, means independent of the seat for holding the plunger device down in operative position, and means connected to and actuated by the said plunger device to cut a brake when the plunger device is raised, substantially as specified.

9. In a motor-vehicle, the combination with a movable seat and a tubular casing attached to the seat-frame, of a plunger device passing through the said casing and bearing upon and actuated by the said seat, a spring within the said casing to keep the plunger against the seat, means for varying the tension on said spring, means for adjusting the length of the said plunger device, means for keeping the plunger device from turning, means connected to and actuated by the said plunger device to connect the power with the motor when the plunger device is depressed and to disconnect the power from the motor when the plunger device is raised, means independent of the seat for holding the plunger device down in operative position, means connected to and actuated by the said plunger device to cut a brake when the plunger device is raised, and means for locking the seat when it is raised, substantially as specified.

10. In a motor-vehicle, the combination with a movable seat and a tubular casing attached to the seat-frame, of a plunger device passing through said casing and bearing upon and actuated by the said seat, a

spring within said casing and acting upon the plunger device to cause the same to bear against the said seat, a washer within the said casing, a screw-closure through which the plunger device passes, and by which the tension of said spring is regulated, means for keeping the plunger device from turning, means for varying the length of the plunger device, means connected to and actuated by the plunger device for setting a brake when the plunger device is raised, means independent of the seat for holding the plunger device in its operative position, and means for locking the seat when the same is raised, substantially as specified.

11. In a motor-vehicle, the combination with a movable seat and a tubular casing attached to the seat-frame, of a plunger device passing through said casing and bearing upon and actuated by the said seat, a spring within said casing and acting upon the plunger device to cause the same to bear against the said seat, a washer within the said casing, a screw-closure through which the plunger device passes and by which the tension of said spring is regulated, a bar connected to the said casing, a collar surrounding the said plunger device and connected to the said bar, a pin in said collar passing into a slot in said plunger device to keep the latter from turning, means for varying the length of the plunger device, means connected to and actuated by the plunger device for setting a brake when the plunger device is raised, means independent of the seat for holding the plunger device in its operative position, and means for locking the seat when the same is raised, substantially as set forth.

12. In a motor-vehicle, the combination with a movable seat and a tubular casing attached to the seat-frame, of a plunger device passing through said casing and bearing upon and actuated by the said seat, a spring within said casing and acting upon the plunger device to cause the same to bear against the said seat, a washer within the said casing, a screw-closure through which the plunger device passes and by which the tension of said spring is regulated, a bar connected to the said casing, a collar surrounding the said plunger device and connected to the said bar, a pin in said collar passing into a slot in said plunger device to keep the latter from turning, a coupling within which the plunger device is divided, whereby the length of the same may be varied, means connected to and actuated by the plunger device for setting a brake when the plunger device is raised, means independent of the seat for holding the plunger device in its operative position, and means for locking the seat when the same is raised, substantially as specified.

13. In a motor-vehicle, the combination with a movable seat and a tubular casing attached to the seat-frame, of a plunger device passing through said casing and bearing upon and actuated by the said seat, a spring within said casing and acting upon the plunger device to cause the same to bear against the said seat, a washer within the said casing, a screw-closure through which the plunger device passes, and by which the tension of said spring is regulated, a bar connected to the said casing, a collar surrounding the said plunger device and connected to the said bar, a pin in said collar passing into a slot in said plunger device to keep the latter from turning, a coupling within which the plunger device is divided whereby the length of the same may be varied, a ball-crank lever pivoted to bracket-legs under the floor of the vehicle and actuated by the plunger device to operate a brake when the plunger device is raised, means independent of the seat for holding the plunger device in its operative position, and means for locking the seat when the same is raised, substantially as specified.

14. In a motor-vehicle, the combination with a movable seat and a tubular casing attached to the seat-frame, of a plunger device passing through said casing and bearing upon and actuated by the said seat, a spring within said casing and acting upon the plunger device to cause the same to bear against the said seat, a washer within the said casing, a screw-closure through which the plunger device passes and by which the tension of said spring is regulated, a bar connected to the said casing, a collar surrounding the said plunger device and connected to the said bar, a pin in said collar passing into a slot in said plunger device to keep the latter from turning, a coupling within which the plunger device is divided whereby the length of the same may be varied, a ball-crank lever pivoted to bracket-legs under the floor of the vehicle and actuated by the plunger device to operate a brake when the plunger device is raised, a slide-plate, through which the plunger device passes, attached to a plate under the floor of the vehicle, a foot-actuated post, a lever pivoted to the said post and in a bracket integral with the said plate, an end of the said lever being adapted to fit into an opening in the said slide-plate whereby when the plunger device is down the slide-plate may be moved along by the depression of the post to engage with a notch in the plunger device to hold the same in operative position, and means for locking the seat when the same is raised, substantially as specified.

15. In a motor-vehicle, the combination with a movable seat and a tubular casing attached to the seat-frame, of a plunger device passing through said casing and bearing upon and actuated by the said seat, a spring within said casing and acting upon the plunger device to cause the same to bear against the said seat, a washer within the said casing, a screw-closure through which the plunger device passes and by which the tension of said spring is regulated, a bar connected to the said casing, a collar surrounding the said plunger device and connected to the said bar, a pin in said collar passing into a slot in said plunger device to keep the latter from turning, a coupling within which the plunger device is divided whereby the length of the same may be varied, a ball-crank lever pivoted to bracket-legs under the floor of the vehicle and actuated by the plunger device to operate a brake when the plunger device is raised, a slide-plate, through which the plunger device passes, attached to a plate under the floor of the vehicle, a foot-actuated post, a lever pivoted to the said post and in a bracket integral with the said plate, an end of the said lever being adapted to fit into an opening in the said slide-plate whereby when the plunger device is down the slide-plate may be moved along by the depression of the post to engage with a notch in the plunger device to hold the same in operative position, and means for locking the seat when the same is raised, substantially as specified.

699,584. IMPLEMENT FOR CUTTING PAPER OR THE LIKE. HARRY J. SMITH, New York, N. Y. Filed Apr. 19, 1901. Serial No. 69,154. (No model.)

Claim.—1. An implement for cutting paper and the like comprising

ing a handle, a circular cutter-blade mounted in one end of the said handle, a ratchet-wheel connected to the said cutter-blade, a pawl mounted in connection with the handle and engaging said ratchet-wheel whereby to hold the cutter-blade rigidly or immovably to the handle when drawn in one direction and to permit it to turn in the opposite direction.

2. An implement for cutting paper and the like comprising a handle, an arm projecting therefrom, a circular cutter-blade provided with a spindle which passes through the end of the said arm, a ratchet-wheel mounted upon the said spindle between the blade and the arm and rigidly connected to each disk, a spring-pawl comprising a single piece of wire passing through the arm of the handle and bearing upon the said ratchet-wheel, and a milled nut mounted upon the spindle upon the opposite side of the arm of the handle.

699,585. VISE. WILLIAM E. SCHUBERT, Camden, N. J. Filed Apr. 8, 1901. Serial No. 54,028. (No model.)

Claim.—1. In a vise and in combination with jaws carried by fixed and movable arms and a link insuring said arms, of a bolt having surfaces forming a right angle adapted to engage with a rack on said fixed arm, a key for holding said bolt in position, a bolt-head having a segmental recess and a pin carried by said link engaging with said bolt-head substantially as described.

2. In a vise and in combination with jaws carried by fixed and movable arms and a link insuring said arms, of legs on the movable arm above and below said link, a spring secured to said movable arm tending to draw the back end of the link down, and a spring placed below the fixed arm of the movable lever tending to keep the jaws separated, substantially as described.

3. In a vise and in combination with jaws carried by fixed and movable arms pivoted together at their lower ends, of an adjustable jaw-then having legs carrying a rod, a clamp secured to said movable arm, a projection on said clamp curved to fit the surface of the adjustable jaw-then and adapted to hold said jaw-then in place and allow it to turn freely, substantially as described.

699,586. CAP FOR PUMPS. CHARLES E. SHRYVER, Loveland, Nev. Filed Nov. 13, 1901. Serial No. 69,500. (No model.)

Claim.—A cap for pumps, comprising a shell having a body portion, a pointed end, an offset on its interior to limit the insertion of a stem therein, and prongs struck up from said cylindrical portion to engage a stem, substantially as set forth.

699,587. ARTIFICIAL BUILDING-STONE. CHARLES W. SHRYVER, North Harvey, Ill. Filed Jan. 7, 1902. Serial No. 69,600. (No model.)

Claim.—1. An artificial building-stone comprising two outer walls spaced apart and connected together by posts formed integrally therewith, substantially as described.

2. An artificial building-stone comprising two oppositely-disposed walls spaced apart and connected together, the space between said walls being unobstructed on four sides, substantially as described.

3. An artificial building-stone comprising outer parallel walls spaced apart and connected together, the space therebetween being open on all sides not limited by said outer walls, substantially as described.

4. An artificial building-stone comprising two outer walls and an intermediate wall, said walls being spaced apart and connected together by posts formed integrally therewith, substantially as described.

5. An artificial building-stone comprising three walls, spaced apart and connected together, the space between two of said walls being open on three sides, substantially as described.

6. An artificial building-stone comprising three walls spaced apart and connected together, the space between two of said walls being open on four sides, substantially as described.

7. An artificial building-stone comprising two walls, spaced apart and connected together by posts, substantially as described.

8. An artificial building-stone comprising three walls spaced apart and connected together by posts, substantially as described.

699,588. PROCESS OF MAKING ARTIFICIAL STONE. CHARLES W. SHRYVER, North Harvey, Ill. Filed Mar. 21, 1901. Serial No. 62,100. (No specimens.)

Claim.—1. The process of making artificial stone, which comprises pouring a wet artificial-stone compound into a mold and around a bottomless core-box, said box containing a core of dry sand or similar material, and in withdrawing said core-box, while said compound is still in a flowing condition, in such a manner that said flowing compound will follow the lower ends of said core-box and fill in after it as the same is withdrawn, and in then allowing the stone compound to set, substantially as described.

2. The process of making artificial stone, which comprises pouring a wet artificial-stone compound into a mold and around a core-box surrounding a plurality of relatively dry sand cores, and in withdrawing said core-box so that said stone compound will flow into and fill the spaces previously occupied by the walls and partitions of said core-box, and in then allowing the stone compound to set, substantially as described.

3. The process of making artificial stone, which consists in forming a layer of sand in the bottom of a mold, in pouring liquid stone compound upon said layer of sand, in placing a core-box containing a plurality of bottomless core-chambers upon said layer of stone compound, in filling relatively dry sand into said core-chambers, in then pouring plastic stone compound into said mold and around said core-box, and in then withdrawing said core-box so that the stone compound will flow into the spaces surrounding said cores, and in then allowing said stone compound to set, substantially as described.

4. The process of making artificial stone, which consists in forming a dry-sand core in a mold, said core being surrounded and supported by removable walls, in then pouring artificial-stone compound, in a plastic or semifluid condition, into said mold and around said core, in then removing the supporting-walls surrounding said core, while said stone compound is still sufficiently plastic to flow into the spaces previously occupied by said removable walls, and in then allowing said stone compound to set, substantially as described.

5. The process of making artificial stone, which consists in forming a mold containing a plurality of dry-sand cores, said cores being initially supported and separated by removable partition-boards, in then pouring wet artificial-stone compound into said mold, in then removing said partition-boards, while said compound remains sufficiently plastic to flow into

the space between and surrounding said end cores, and is then allowing the stone compound to set, substantially as described.

3. The process of making artificial stone, which consists in forming a mold containing a plurality of dry sand cores, said cores being laterally supported by removable parting-boards and separated by parting-boards so disposed as to provide a space between the opposing faces of said parting-boards, in then pouring wet artificial-stone compound into said mold around and between said parting-boards, in withdrawing said parting-boards while the stone compound is still sufficiently plastic to flow into the space previously occupied by the parting-boards, and is then allowing the compound to set, substantially as described.

699,589. BATHING APPARATUS. WILLIAM J. STOFFER, San Francisco, Cal. Filed Dec. 21, 1899. Serial No. 41,569. (No model.)

Claim.—1. In a receptacle of the class described, a collapsible body comprising a flexible bottom and an upstanding flexible rim, and a plurality of handle elements secured at the sides of the receptacle and extending across the same, said handle elements being arranged in interlocking relation.

2. A receptacle of the class described, comprising a collapsible body having a flexible bottom and a continuous flexible upstanding rim, and a plurality of flexible handle elements, the ends of said elements being secured to the edge of the receptacle, the distance between the points of attachment of the several ends being equal.

3. In a receptacle of the class described, a collapsible body comprising a flexible bottom having a continuous flexible upstanding rim, and a plurality of flexible handle elements, the ends of each handle element being secured to diametrically opposite portions of the body, whereby said handle elements will be located in intersecting relation.

4. In a receptacle of the class described, a collapsible body comprising a bottom made of flexible waterproof material having a flexible continuous upstanding side rim, one secured to the edge of the body at diametrically opposite points and having eyes at their terminals which project above the side walls, and a plurality of independent flexible handle elements secured respectively at their ends to the oppositely-disposed projecting eyes and arranged across the body in intersecting relation.

699,590. ELECTRIC RAILWAY. ALBERT A. STOLLER, New York, N. Y. Filed Oct. 25, 1901. Serial No. 79,512. (No model.)

Claim.—1. In an electric-railway crossing, the combination with a conductor of one line having a vertical side face adapted to receive a con-

tact member and having a gap at the point where it crosses the other line, of means for closing said gap including a movable bridge-piece supported upon one part of said conductor, extending along the vertical contact-face thereof, and having a similar side contact-face and means for moving the same into or out of position to form a connection across said gap.

2. In an electric-railway crossing, the combination with a conductor of one line having a vertical side face adapted to receive a contact member and having a gap at the point where it crosses the other line, of means for closing said gap including a movable bridge-piece supported upon one part of said conductor, extending along the vertical contact-face thereof and having a similar side contact-face and means automatically moving the same into or out of position to form a connection across said gap as a car passes over said crossing.

3. In an electric-railway crossing, the combination with a conductor of one line having a gap at the point where it crosses the other line, of means for closing said gap including a movable bridge-piece slidably connected to said conductor at one side of said gap, and means automatically moving the same into position to form a connection across said gap as a car passes over said crossing, and means for automatically returning said bridge-piece to its original position.

4. In an electric-railway crossing, the combination with a conductor of one line having a gap at the point where it crosses the other line, of means for closing said gap including a movable bridge-piece slidably connected to said conductor at one side of said gap, and means attached directly to the bridge-piece in position to be engaged by the contact member of a car for moving said bridge-piece with said contact member to maintain the connection of said contact member with the conductor as said contact member crosses said gap.

5. In an electric-railway crossing, the combination with a conductor of one line having a gap at the point where it crosses the other line, of means for closing said gap including a movable bridge-piece slidably connected to said conductor at one side of said gap, and means attached directly to said bridge-piece in position to be engaged by a car for moving said bridge-piece to a position to form a connection across said gap as a car passes over said crossing, and means for automatically returning said bridge-piece to its original position.

6. In an electric-railway crossing, the combination with a conductor of one line having a gap at the point where it crosses the other line, of means for closing said gap including a movable bridge-piece slidably connected to said conductor at one side of said gap, and means connected to said bridge-piece adapted to be engaged by a car for moving said bridge-piece to a position to form a connection across said gap as a car passes over said crossing, means for automatically disengaging said bridge-piece when the car has passed said crossing, and means for automatically returning said bridge-piece to its original position.

7. In electric railways, means for closing a gap in a conductor comprising a movable bridge-piece, a projecting member connected to said bridge-piece, and means whereby said projecting member is automatically engaged by a car moving in one direction and withdrawn from the path of a car moving in the opposite direction.

8. In electric railways, means for closing a gap in a conductor comprising a movable bridge-piece, a hook connected to said bridge-piece, and means whereby said hook is automatically engaged by a car moving in one direction and withdrawn from the path of a car moving in the opposite direction.

9. In electric railways, the combination with a conductor adapted to receive a contact member on its vertical side face and formed in two parts separated by a gap, of a bridge-piece supported upon one part of said conductor extending along the vertical contact-face thereof and adapted to be moved in a direction to close said gap.

10. In electric railways, the combination with a conductor adapted to receive a contact member on its vertical side face and formed in two parts separated by a gap, of a bridge-piece supported slidably upon one of said parts extending along the vertical contact-face thereof and adapted to be moved in a direction to close said gap.

11. In electric railways, the combination with a pair of opposite conductors A A' each adapted to receive a contact member on its vertical side face and formed in two parts separated by a gap, of a bridge-piece supported upon one part of said conductors extending along the vertical contact-face thereof and adapted to be moved in a direction to close said gaps.

12. In an electric-railway crossing, the combination with a pair of conductors of one line having vertical side faces between and in contact with which the contact member of the car travels and which have gaps at the point where they cross the other line, of means for closing said gaps including a movable bridge-piece supported upon said conductors, extending along the vertical contact-face thereof and having similar side contact-faces and means for moving the same into or out of position to form connection across said gaps.

699,591. FILE. JAMES F. SULLIVAN, Philadelphia, Pa., assignor of one-half to James Richardson, Philadelphia, Pa. Filed Apr. 11, 1899. Serial No. 55,292. (No model.)

Claim.—1. In a file, a base, a detachable filing-epistle thereon and a transfer-epistle having means at one end whereby it may be attached to the lower end of the filing-epistle to the end that the papers from the first-mentioned epistle may be transferred to the other by the jolting of the epistles.

2. A file comprising a base, a epistle removably held therein, and a second epistle of less diameter, and means for detachably uniting the two epistles to form a continuous one.

3. A file comprising a base, a epistle removably held therein, a removable point to said epistle, and a second epistle of less diameter than the first-mentioned epistle and provided with a removable hook and designed to receive the first-mentioned epistle when said hook is removed.

4. In a file, a base, a epistle having lower threaded end, and with an opening transversely through said threaded end, and a nut on said threaded end covering the epistle to the base and covering said opening to exclude dust, &c., therefrom.

699,592. PROCESS OF REINFORCING JOINTS OF SUBMERGED VESSELS HERMETICALLY TIGHT. WALTER THOMPSON, Toronto, Canada, assignor to John Murphy, Brooklyn, N. Y. Filed Mar. 28, 1898. Serial No. 100,004. (No specimens.)

Claim.—1. The process of forming an hermetic joint or seal between laminated layers having flexible metallic coatings, which consists in immersing said layers, with their coatings protruding, in a bath composed of a suitable fluid having a temperature higher than the fusing-point of said coatings, until said portions fuse and form one integral body, and then removing the same from the bath and allowing the fused portions to set, substantially as described.

2. The process of sealing the joints of sheet-metal vessels having a coating formed of flexible material which consists in immersing the joints to be treated in a bath composed of a suitable fluid and having a temperature higher than the fusing-point of said coating until the coating is fused and then removing the joints from the bath and allowing their fused portions to set, substantially as described.

3. The process of forming an hermetic seal in the joints of sheet-metal vessels having a flexible coating which consists in immersing the joint to be treated in a bath of molten oil heated to a temperature higher than the fusing-point of said coating and maintaining said joints therein until said coating is fused and forms one integral body and then removing the joints from the bath and allowing their fused portions to set, substantially as described.

699,593. BAKING-HANDLE. HARRY THOMAS, Boston, N. Y. Filed Nov. 12, 1899. Serial No. 51,095. (No model.)

Claim.—1. A baking-handle, formed in two sections of spring material, each section having a grip at one end and a hook at the other end,

and a shoulder intermediate the ends of the sections, the said sections being arranged to enter the sides of the basket and the shoulders to bear on the top thereof, and the hooks being capable of interlocking to connect the sections together and also to place them under tension, whereby to cause the shoulders to bear down firmly on the cover.

2. A basket-handle formed in two sections of yielding material, each section having an intermediate part to bear on the basket-top and also having at its lower end means for engaging the basket, the upper ends of the sections being capable of interengagement whereby to connect the ends together and also to place them under tension whereby to cause the said intermediate parts of the sections to bear down firmly on the top of the basket.

699,594. APPLICATOR. GEORGE J. VAN SICK, French, N. J. Filed Oct. 23, 1899. Serial No. 79,471. (No model.)

Claim.—1. An instrument of the character described, comprising a curved tubular shell, an applicator for insertion in the shell, said applicator comprising a perforated cap, a curved tubular stem extending from the cap, and a cap secured to the stem and engaging the shell to close the end thereof, and a curved tubular follower having a perforated end and adapted to be inserted in said applicator, as set forth.

2. An applicator, comprising a cap, a segmental tube carrying the cap, and a segmental follower for insertion into the tube to pass with it forward and into the said cap, as set forth.

3. An applicator, comprising a perforated cap, a segmental tube carrying the cap, and a segmental tubular follower for insertion into the said tube and having its inner end perforated, and through which a medicament is adapted to be forced by pressure, as set forth.

4. An applicator, comprising a cap for engaging the cervix uteri, a segmental tube carrying the cap and opening into the same at the bottom thereof, and a segmental tubular follower for insertion into the said tube and cap and having its forward end perforated, as set forth.

5. An applicator, comprising a cap for engaging the cervix uteri, a segmental tube carrying the cap and opening into the same at the bottom thereof, and a segmental tubular follower for insertion into the said tube and cap and having its forward end perforated, the follower having a longitudinal inlet-channel and a longitudinal outlet-channel, as set forth.

6. An applicator, comprising a segmental shell for insertion in the vagina and formed at its outer end with recesses, a perforated cap for insertion in the said shell to engage the cervix uteri, a segmental tube carrying the said cap and opening into the bottom thereof, and a cap on the outer end of the said tube and having lugs for slidably engaging the said shell-recesses, as set forth.

7. In an applicator, a segmental shell, a perforated cap, a segmental tube carrying the cap and opening into the same at the bottom thereof, and a cap on the outer end of the tube and having a locking engagement with the shell, as set forth.

699,595. STOPPING-ONE FOR PHOTOGRAPHIC PLATES. ALFRED WAGNER, Munich, Germany. Filed Jan. 11, 1898. Serial No. 39,204. (No model.)

Claim.—1. In a receptacle for photographic plates and the like, a leaf having a means in its face to receive the plates, said means extending to the lower edge of the leaf and exposing the entire surface of the plates.

2. In a receptacle for photographic plates and the like, a book consisting of a number of leaves hinged together each of which has a recess in its face extending to its lower edge and exposing the entire surface of the plates.

3. In a receptacle for photographic plates, a leaf consisting of a substantially U-shaped frame, and a thin backing covered upon both sides of the frame and extending into the open portion of the same to form a plate-supporting recess extending to the lower edge of the leaf and exposing the entire surface of the plate.

4. In a receptacle for photographic plates, a number of leaves hinged together in a book form, said leaves consisting of frames open at the hinge and a thin backing covered upon and over the frame forming therewith a recess for the plate.

5. In a receptacle for photographic plates and the like, a leaf consisting of a frame open at one side and having thin covering-sheets attached to the front and back thereof, one of said sheets being stretched tight, while the other is depressed through the frame to form a recess, the two sheets being pasted or fastened together.

6. A book for holding photographic plates composed of a number of leaves hinged together, each of said leaves being composed of a frame open at the hinged side, and a thin sheet covered on the frame, stretched over the back thereof and drawn over the front of the same and pressed therethrough and onto the stretched sheet, whereby a recess with an open lower end is formed in the face of the leaf to support the plate with its lower edge resting on the back of the book.

699,596. REVERSING-GEARING. CLAREN W. WALKER, Camden, N. J. Filed July 31, 1901. Serial No. 70,289. (No model.)

Claim.—1. In a reversing-gearing, the combination of an expandable and contractible bearing, a frame adapted to rotate and having a journal mounted in said bearing, a driven shaft extending through said journal, a drive-shaft journaled in the frame in longitudinal alignment with said driven shaft, means for clamping the frame to the drive-shaft, gearing between the drive and driven shafts, and means for simultaneously causing the bearing to grip the frame-journal and the clamping means to release the drive-shaft, and vice versa, substantially as described.

2. In a reversing-gearing, the combination of an expandable and contractible bearing, a frame provided at one end with a journal mounted in said bearing and at its other end with a clamp, a drive-shaft mounted in the frame and adapted to be engaged and released by said clamp, a counter-shaft mounted in said journal, gearing between the two shafts, a screw mounted upon the expandable bearing and clamp, and means for operating said screw to simultaneously contract the bearing and expand the clamp, and vice versa, substantially as described.

699,597. LOCKING SYSTEM FOR MAIL-BOXES. JOHN E. WALKER, Washington, D. C. Filed Feb. 10, 1902. Serial No. 90,346. (No model.)

Claim.—1. In a locking system for a series of receptacles, the combination with a portable carrier adapted to hold the keys of said receptacles, of means located at each of said receptacles for releasing the key to the next succeeding receptacle in the series.

2. The combination with a portable carrier adapted to hold the keys of a series of receptacles, of unlocking means located within each of said receptacles for releasing the key to the next succeeding receptacle of the series.

3. In a locking system for a series of receptacles, the combination with portable means adapted to hold the key of each of said receptacles in an inoperative position, of means located within each of said receptacles for releasing the key to the next succeeding receptacle of the series.

4. The combination with a portable carrier for holding the keys of a series of receptacles in an inoperative position, of a key located within each receptacle of the series for releasing the key to the next succeeding receptacle.

5. In a mail-box-locking system the combination with portable means for securing the keys of a series of boxes, of independent locking and unlocking means for each key located within each box of the series for releasing the key to the next succeeding box.

6. In a mail-box-locking system, the combination with a portable carrier for holding the keys for a series of mail-boxes in an inoperative position, of means located at each box for releasing the key to the next box of the series, and means for returning the preceding key of the series to an inoperative position.

7. In a mail-box-locking system, the combination with portable means for holding the keys of a series of boxes, of unlocking means for each key located at each box, and means for locking the preceding key in an inoperative position upon the release of the key to the next box of the series, substantially as set forth.

8. In a mail-box-locking system, the combination with portable means for securing the keys of a series of boxes in an inoperative position, of means located within each box for releasing the key of the next succeeding box of the series, and means for locking the preceding key of the series in an inoperative position whereby the entire series of boxes must be opened in their regular order before the first box can again be opened.

9. In a mail-box-locking system, the combination with a key-carrier having a separate key for each box in the system, of means for retaining said keys normally in an inoperative position, and means located at each box for releasing the key of the next succeeding box.

10. In a mail-box-locking system, the combination with a key-carrier having a separate key for each box in the system, of means for retaining said keys normally in an inoperative position, means located at each box for releasing the key to the next succeeding box, and a connection between each key and the preceding key by which one key is retracted as the other is released.

11. The combination in a device of the character described, of a key-carrier comprising a casing, a number of keys pivoted therein, a series of key-operated bolts each pivoted to one of the keys, tumblers pivoted in the casing and engaging the bolts, means on each tumbler engaging the preceding tumbler and means for retracting the bolts.

12. The combination in a device of the character described, of a key-carrier comprising a casing, a number of keys pivoted therein, a series of key-operated bolts each pivoted to one of the keys, tumblers pivoted in the casing and engaging the bolts, a pin on each tumbler engaging the preceding tumbler and springs bearing on the keys, substantially as described.

699,598. BURNER AND INHALER. WILLIAM E. WALKER, Verona, N. J. Filed July 28, 1901. Serial No. 90,350. (No model.)

Claim.—1. A burner and inhaler, comprising a shell having a hinged bottom, a dome, a discharge-spout extending from the apex of the dome, a flexible tube for carrying off the generated fumes, and a burner on the upper side of said hinged bottom, for receiving and burning the drugs, said burner being formed by a central solid portion of the bottom and by an annular flange rising from said bottom and surrounding said central portion, the bottom being provided with air-inlets outside said flange and leading into the shell, to furnish the necessary air for proper combustion of herbs or drugs placed in the burner, as set forth.

2. A burner and inhaler, consisting of a shell having a dome-shaped upper portion terminating in a spout, and a hinged bottom having a combined catch and handle, the bottom being provided with an annular vertical flange on its inner face and of less diameter than the shell and with perforations in the space intervening the flange and shell, as set forth.

699,599. CORNER-GRASP-GETTING MACHINE. MARTIN B. WATSON, Ansonia, Conn. Filed Feb. 27, 1902. Serial No. 90,397. (No model.)

Claim.—1. In a tipping-machine, the combination with "three-high" compression-rolls, of means for feeding stock with tips upon the ends between two of the rolls, means for placing the stock in line with the other rolls, tipping the stock and passing each tipped stock between the other rolls, substantially as set forth.

2. In a tipping-machine, the combination with a reciprocating feed device, a chute for tips between the feed device and compression-rolls, a second reciprocating feed device below the plane of the first one, a second chute for tips between the second feed device, and compression-rolls arranged "three high," substantially as shown and for the purpose set forth.

3. In combination with three rolls arranged one above the other, reciprocating feeds on opposite sides of the rolls and tip-holders between the reciprocating feeding means and the intake-faces of the rolls, for the purpose set forth.

4. In a tipping-machine, a chute, means for taking stock successively therefrom, a reciprocating feed which engages the stock, a chute to receive tips which if open is in the path of the stock the chute being positioned adjacent to the intake-face of the compression-rolls, a second feed to which the stock with tips on one end are fed by the upper compression-rolls, a chute for tips between said feed and the intake-faces of the lower compression-rolls, the compression-rolls being "three high," substantially as shown and for the purpose set forth.

5. In a corner-grasp-getting machine, the combination with the "three-high" rolls, stop-supports on opposite sides of the rolls on different planes, reciprocating carriages which engage the stops and feed them to the intake sides of the rolls, and chutes for tips opposite the intake-faces of the rolls, substantially as shown.

6. In a tipping-machine, compression-rolls having their intake-faces on different planes, a reciprocating feed for presenting stock with tips thereon to the intake-faces of a pair of the rolls, means for effecting an engagement of the partially-tipped stock with a second feed which when reciprocated presents the stock to the lower rolls, substantially as shown.

7. In a day-tipping machine, the combination of a hopper, means

for feeding stock therefrom, a two-part carrier between which a steel is clamped, and means for reciprocating the carrier, substantially as shown.

8. The combination in a tip-attaching machine, of a carriage having parts which are movably connected, a slide upon which one part of the carriage is mounted, means for reciprocating the carriage connected to its upper movable part, substantially as shown, whereby when the carriage is moved in one direction the upper part will be raised, and when moved in an opposite direction the upper part will be lowered.

9. The combination in a tip-attaching machine, of rolls, tip-carriers adjacent to the rolls, reciprocated carriages on each side of the rolls, a hopper for the stops, and means for feeding the stops from the hopper to one of the carriages, substantially as shown.

10. In a tip-attaching machine, a two-part reciprocating carrier, the parts being connected so that as the carrier is moved in one direction the parts will be separated and when moved in the other direction the parts will be brought together to clamp a steel and feed it into compression-rolls.

699,600. WOOD-GRINDING MACHINE. EDWARD WOODRUM, Glasgow, Austria-Hungary. Filed Nov. 2, 1902. Serial No. 90,398. (No model.)

Claim.—1. A wood-grinding machine, comprising a cylindrical housing, a multiplicity of parallel-pipedal boxes for the reception of the wood to be ground, disposed in the vertical walls of said housing and projecting radially therefrom, said boxes open at their inner ends, a feed-piston in each of said boxes having a toothed rod, a vertical shaft revolvable in axially-disposed bearings in the base and cover of the housing and a grinding-stone of the form of an inverted truncated cone secured to said shaft; in combination with a spindle revolvable in bearings in brackets secured to the outer face of each box, a piston secured to said spindle and gearing with the toothed piston-rod, a rope-drum also secured to said spindle and a weighted rope wound on said drum to revolve the piston so as to move the piston inwardly, substantially as set forth.

2. A wood-grinding machine comprising a cylindrical housing, a multiplicity of parallel-pipedal boxes for the reception of the wood to be ground, disposed in the vertical walls of said housing and projecting radially therefrom, said boxes open at their inner ends, a feed-piston in each of said boxes having a toothed rod, a vertical shaft revolvable in axially-disposed bearings in the base and cover of the housing and a grinding-stone of the form of an inverted truncated cone secured to said shaft; in combination with a spindle revolvable in bearings in brackets secured to the outer face of each box, a piston secured to said spindle and gearing with the toothed piston-rod, a rope-drum also secured to said spindle and a weighted rope wound on said drum to revolve the piston so as to move the piston inwardly and means for revolving the drum by hand is a second claim.

verse direction and locking the same against rotation, substantially as and for the purpose set forth.

2. A wood-grinding machine comprising a circular base, a plurality of vertical frames removably secured thereto so as to form between them rectangular open-ended spaces, the inner, narrower ends of said frames constituting the vertical wall of the housing, one or more of the inner ends of the frames of each group having a vertical recess for the reception of a perforated pipe, a parallelepipedal box for the wood to be ground removably secured to the base of the housing and to proximate walls of the frames in the spaces between them, said boxes open at their inner end and having a double charging-aperture in their upper wall and a head or cover bolted to the inner end of the vertical frames and boxes; in combination with a vertical shaft revolvable in bearings in the cover and base of the housing, a grinding-stone of the form of a truncated cone secured to said shaft with its periphery proximate to the inner end of the above-said boxes, and means for automatically feeding the wood in the boxes to the stone, for the purpose set forth.

4. A wood-grinding machine, comprising a circular base provided with a depression for the collection of the fiber, a plurality of vertical frames removably secured thereto so as to form between them rectangular open-ended spaces, the inner, narrower ends of said frames constituting the vertical wall of the housing, one or more of the inner ends of the frames of each group having a vertical recess for the reception of a perforated pipe, a parallelepipedal box for the wood to be ground removably secured to the base of the housing and to proximate walls of the frames in the spaces between them, said boxes open at their inner end and have a double charging-aperture in their upper wall and a head or cover bolted to the inner end of the vertical frames and boxes; in combination with a vertical shaft revolvable in bearings in the cover and base of the housing, a grinding-stone of the form of a truncated cone secured to said shaft with its periphery proximate to the inner end of the above-said boxes, and means for automatically feeding the wood in the boxes to the stone, for the purpose set forth.

699,601. CORN HARVESTING AND HOOKER. THOMAS P. WHEAT and IRON WHEAT, Plymouth, Ind. Filed Sept. 25, 1901. Serial No. 74,408. (No model.)

Claim.—1. A corn harvester and hooker, comprising a pair of driving-rolls for drawing the stalks downward, the said rolls being arranged horizontally and spaced apart, the space between the rolls decreasing in width from the front to the rear thereof, a pair of pulling-rolls similarly spaced for pulling the ear off the stalk at the time the latter is drawn downward, the pulling-rolls being inclined and extending from in front of the driving-rolls upwardly and rearwardly over the same, means for elevating the pulled-off ear, and a hooking device for receiving the ear from the elevating means to remove the husk from the ear, as set forth.

2. A corn harvester and hooker, comprising a pair of driving-rolls for drawing the stalks downward, the said rolls being arranged horizon-

tally and spaced apart, the space decreasing in width from the front to the rear thereof, a pair of pulling-rolls similarly spaced apart and arranged for pulling the ear off the stalk at the time the latter is drawn downward, the pulling-rolls being inclined and extending from in front of the driving-rolls upwardly and rearwardly over the same, means for elevating the pulled-off ear, a hooking device for receiving the ear from the elevating means to remove the husk from the ear, and an elevator for receiving the husked ear from the said hooking device to discharge the ear from the machine, as set forth.

3. A corn-harvester, comprising a main frame, an inclined elevator-frame mounted thereon and having a slot in its middle, the forward ends of the frame being provided with chutes for guiding the stalk into the slot, elevator-frames mounted to travel on the elevator-frame at each side of the slot, similarly-inclined pulling-rolls journaled on the frame at each side of the slot and extending into the same, the pulling-rolls being spaced apart and the space between the rolls decreasing in width from the front or lower end to the rear end thereof, and a horizontally-arranged driving device for the stalks, the pulling-rolls extending from in front of the driving device upwardly and rearwardly over the same, as set forth.

4. A corn-harvester, comprising a main frame, an inclined elevator-frame made in two parts spaced apart and having chutes at their forward ends to guide the stalk into the space between the members of the frame, a pair of driving-rolls for drawing the stalk downward and arranged below the elevator-frame and extending horizontally, brackets carried by the main frame to which the driving-rolls are journaled, the said driving-rolls being spaced apart, the space decreasing in width from the front of the rolls to the rear thereof, curvilinearly-bent chutes at the forward ends of the brackets to guide the stalks between the driving-rolls, and pulling-rolls arranged above and at an inclination to the driving-rolls for pulling the ear in a direction opposite to that in which the stalk is drawn by the driving-rolls, the inclination of the pulling-rolls corresponding with that of the elevator-frame, as set forth.

5. A corn-harvester having a driving device comprising a pair of driven rolls horizontally arranged and spaced apart for engaging the stalk and drawing the same downward, and a pulling device comprising a pair of inclined rolls extending from in front of the driving-rolls upwardly and rearwardly above the same, and likewise spaced apart, the space between the said pairs of rolls being in vertical alignment, the pulling-rolls operating in unison with the driving-rolls to pull the ear off the stalk while the latter is drawn downward, as set forth.

6. A corn-harvester having a driving device comprising a pair of driven rolls, horizontally arranged and spaced apart, the space decreasing in width from the forward to the rear ends of said rolls, the said rolls being arranged to engage the stalk and draw the same downward, a pulling device comprising a pair of inclined pulling-rolls extending from in front of the driving rolls upwardly and rearwardly above the same and similarly spaced apart, the pulling-rolls operating in unison with the driving-rolls to pull the ear off the stalk while the latter is drawn downward, and an elevator for receiving the pulled-off ear from the said pulling device and moving it upward and rearward away from the pulling device, as set forth.

7. A corn-harvester, having a pair of driven driving-rolls for engaging the stalk and drawing the same downward, the driving-rolls extending in a horizontal direction and a pair of driven pulling-rolls for pulling the ear off the stalk engaged at the time by the driving-rolls, the pulling-rolls being inclined and extending from in front of the driving-rolls upwardly and rearwardly over the same, as set forth.

8. A corn-harvester, having a pair of driven driving-rolls for engaging the stalk and drawing the same downward, the driving-rolls extending in a horizontal direction and rotating toward each other in a downward direction, and a pair of driven pulling-rolls rotating toward each other in an upward direction and adapted to pull the ear off the stalk engaged at the time by the driving-rolls, the pulling-rolls being inclined and extending from in front of the driving-rolls upwardly and rearwardly over the same, as set forth.

9. A corn-harvester having a pair of horizontally-arranged driven driving-rolls for engaging the stalk and drawing the same downward, and a pair of inclined driven pulling-rolls extending from in front of the driving-rolls upwardly and rearwardly over the same, the pulling-rolls being smooth and the driving-rolls being fluted, and the rolls in each pair being spaced apart and arranged obliquely one to the other, as set forth.

10. A corn-harvester, having a pair of horizontally-arranged driven driving-rolls for engaging the stalk and drawing the same downward, the driving-rolls being fluted and rotating toward each other in a downward direction and a pair of inclined driven pulling-rolls rotating toward each other in an upward direction, the pulling-rolls being smooth and extending from in front of the driving-rolls upwardly and rearwardly over the same, the rolls in each pair being spaced apart and arranged obliquely one to the other, the forward ends of the rolls in each pair being spaced furthest apart, as set forth.

11. A corn-harvester, comprising a wheeled frame, an inclined elevator-frame mounted thereon and having a slot in its middle extending longitudinally, horizontally-arranged driving-rolls journaled in brackets carried by the main frame, pulling-rolls journaled in the elevator-frame, and inclined to correspond therewith, the pulling-rolls extending from in front of the driving-rolls upwardly and rearwardly over the same, and elevating devices mounted to travel in the elevator-frame on opposite sides of said pulling-rolls, as set forth.

12. A corn harvester and hooker, comprising a wheeled frame, an inclined elevator-frame mounted thereon, and having a slot in its middle, elevator-frames mounted to travel on the elevator-frame at each side of the slot, pulling-rolls inclined to correspond with the elevator-frame and journaled thereon at each side of the slot, horizontally-arranged driving-rolls for drawing the stalks downward, and arranged below the inclined pulling-rolls, brackets carried by the main frame in which the said driving-rolls are journaled, a hooking device for receiving the ear from the elevator-frames, and means for discharging the husked ears from the machine, as set forth.

699,602. SIA. GEORGE F. WHITE, Peabody, Tenn. Filed Apr. 20, 1901. Serial No. 77,000. (No model.)

Claim.—1. A stove-top of the body portion, the roof and the base of the roof connected to the top of the body and composed of a series of overlapping sections.

2. A stove-top of the body portion, the roof and the base of the roof made of sections and connected to the top of the body.

3. The stove-top shown and described, consisting of the vertical standards or supports, the rectangular strips interposed between said supports and having their lower edges stacked snugly, the horizontal rods passing through the supports and interposed strips to bind the lower edges of the strips and supports firmly together and leave the outer edges open or flaring, the top portion mounted upon the body and consisting of the ends of overlapping curved strips secured together and permitting contraction and expansion, the top or cap secured upon said top portion, and the flaps in the body and top to permit access to the fire.

4. The stove-top shown and described, consisting of the vertical supports, the interposed rectangular strips having their lower edges meeting and their outer edges apart, means for clamping the supports and strips firmly together, said strips being made in sections secured together to permit contraction and expansion, the flaps in the body, the vertical chutes adjacent to said flaps, the doors in the sides of the body and chime, and a top portion connected to the body to have a slight movement or play.

699,603. STOVE-TOP. FRANK E. WILSON, Indianapolis, Ind., assignor to the National Malleable Castings Company, Cleveland, Ohio, a Corporation of Ohio. Filed July 28, 1901. Serial No. 68,022. (No model.)

Claim.—1. A stove-top composed of metal castings, each forming one side of the top and having depending edge flanges, one flange upon each casting extending around an outer corner of the top, the inner flange of said member being cut away at each end to form a side joint with the end of the next member, the other end of each member forming an end joint with the side of the adjacent member; substantially as described.

2. A stove-top composed of metal members having depending side flanges, each member forming one side of the top and having an end joint at one end and a side joint at the other end, the inner flange of each member being cut away at its side joint, and the members being secured together by fastenings extending transversely to the plane of the stove-top; substantially as described.

3. A back strip for stove-tops, having an end joint at one end, and a side joint at the other end, said strip having a central opening larger than the fire-opening, and a plate adjustably secured to the back strip over this hole, and containing a fire-opening; substantially as described.

4. A back strip, having an end joint at one end and a side joint at the other end, said strip having a large central hole, a plate adjustably secured over the hole and having a depending part adjustable within said hole, said plate having a fire-opening and flange surrounding it; substantially as described.

699,604. COFFEE-POT. FRANK E. WILSON and JOHN S. GARDNER, New Orleans, La. Filed Feb. 27, 1902. Serial No. 95,000. (No model.)

Claim.—1. The combination with a coffee-pot, of a hollow strainer, for dividing the pot into two compartments, comprising an enlarged perforated base portion, a reduced perforated top portion and an intermediate impervious portion.

2. The combination with a coffee-pot composed of two receptacles, of a strainer, separating the two receptacles, comprising an enlarged perforated base portion, a reduced perforated top portion and an intermediate impervious portion.

3. The combination with a coffee-pot, composed of two receptacles, of a hollow substantially tapering strainer, separating said receptacles, provided with an impervious band centrally disposed circumferentially around the same.

4. The combination with a coffee-pot, composed of two receptacles, of a hollow substantially tapering strainer, separating said receptacles, provided with a removable impervious band centrally disposed circumferentially around the same.

5. The combination with a coffee-pot composed of two receptacles, of a strainer, separating the same, comprising an enlarged perforated base portion, a reduced perforated top portion and an intermediate impervious portion, and provided at its base with an inwardly-projecting conical flange.

699,805. EXTENSION-TABLE. JOHN F. WILSON, Detroit, Mich. Filed Oct. 24, 1901. Serial No. 79,763. (No model.)

Claim.—1. In an extension-table, the combination of a frame, a receptacle for loose leaves having an end thereof open, a table-section connected thereto by slide-rails and a section of the table-top hinged to said frame intermediate the ends of the frame, said section being provided with shirring arranged to drop in front of the receptacle, and being adapted to swing upward carrying the shirring with it to give access to the receptacle, substantially as described.

2. In an extension-table, the combination of an extensible frame containing a receptacle for loose leaves, a table-top in sections arranged to separate, a hinge secured to one of said sections extending under the adjacent section and secured to the frame behind the edge of said section, whereby on lifting the free edge of the hinged section the adjacent edges engage and extend the frame to produce an initial extension thereof, substantially as described.

3. In an extension-table, in combination with extensible slides, a receptacle for loose leaves arranged between the slides and having an end thereof open, a hinged section of the table-top having shirring attached thereto and arranged to swing upward and carry the shirring and thereby give access to the end of the receptacle, substantially as described.

4. In an extension-table, the combination of a frame, a table-top in sections, a swinging section of said top being arranged with its hinge connection at an intermediate line of said table and with its free edge at an end thereof, a fixed section arranged to shut against the hinged edge, a hinge projecting from the swinging section and fixed to a part of the frame behind the abutting edge of the fixed section of the table-top, substantially as described.

5. In an extension-table, in combination with extensible slides, a receptacle for loose leaves arranged between the slides and having an end thereof open, a hinged section of the table-top having shirring attached thereto and arranged to swing upward and carry the shirring and thereby give access to the end of the receptacle, and means for locking the top in its closed position, substantially as described.

699,806. NECK AND COVER FOR CLOSING BOTTLES OR JARS. ALLEN F. WILSON, Dayton, E. J., assignor of one-half to John Wesley Webb, Dayton, E. J. Filed Oct. 1, 1901. Serial No. 77,596. (No model.)

Claim.—In a device for closing bottles and jars, a neck having three substantially cylindrical segmental projections and a free-poleball lip, in combination with a clip having a packing and corresponding longer internal ball-like projections, adapted to engage said short projections and enter the top of the neck and compress the packing into fluid-tight contact with the lip, substantially as set forth.

699,807. GRASP-HANDLIFE. JAMES F. WILSON, York, Pa. Filed June 29, 1902. Serial No. 82,982. (No model.)

Claim.—1. In a machine of the character described, a supporting or rolling table formed of a series of independently-removable slats, and interchangeable forms of different shapes on which the slats are removably seated, substantially as set forth.

2. In a machine of the character described, a supporting or rolling

table formed of a series of parallel independently-removable slats extending lengthwise of the machine, and interchangeable forms of different shapes secured to the machine upon which the slats are removably seated, substantially as set forth.

3. In a machine of the character described, the combination with the frame of the machine, the top of which is provided with an opening having grooves formed in the walls thereof, of interchangeable forms of different shapes secured to the top of the machine, and a supporting or rolling table composed of a series of independently-removable slats having their ends fitting in said grooves and supported by said frame, substantially as set forth.

4. In a machine of the character described, the combination with the frame of the machine, the top of which is provided with an opening having grooves formed in the side walls thereof and flanges projecting inwardly from the side walls and provided with notches, of interchangeable forms of different shapes placed transversely of the opening and having their ends seated in said notches, but secured to the under side of the top of the machine and supporting the ends of said frame, and a table composed of a series of parallel longitudinally-extending independently-removable slats seated in said grooves and supported by said frame, substantially as set forth.

5. In a machine of the character described, a rolling or supporting table formed of a series of independently-removable slats spaced apart and interchangeable forms of different shapes on which said slats are removably seated, substantially as set forth.

6. In a machine of the character described, a rolling or supporting table formed of a series of longitudinally-extending parallel independently-removable slats spaced apart and interchangeable forms of different shapes on which said slats are removably seated, substantially as set forth.

7. In a machine of the character described, the combination with the frame and its rolling-table, of an apron secured to said frame and arranged over said table, a carriage provided with a bunching-roller adapted to coast with the apron and table in forming the bunch, and means located inside of the edges of the apron and projecting therefrom for automatically trimming the rolled work, substantially as set forth.

8. In a machine of the character described, the combination with the frame and its bunching mechanism, of trimming mechanism consisting of cutters located between the two edges of the apron and projecting therefrom and means for actuating said cutters, and a connection between the movable parts of the bunching mechanism and the cutters for actuating the latter to trim the work, substantially as set forth.

9. In a machine of the character described, the combination with the frame and its rolling-table, a forming-apron and a reciprocating carriage provided with a shaping-roller, of cutting mechanism located between the edges of the apron and projecting therefrom supported by the frame, means for adjusting the cutting mechanism, and a connection between the cutting mechanism and the carriage for actuating said cutting mechanism, substantially as set forth.

10. In a machine of the character described, the combination with the frame provided with a rolling-table, an apron, and a carriage provided with a shaping-roller, of a cutter consisting of two blades provided with oppositely-disposed cam-edges, a sliding rod extending through said slats, and a connection between the sliding rod and the carriage for actuating the blades by the movement of the carriage, substantially as set forth.

11. In a machine of the character described, a supporting or rolling

table, the combination with the frame of the machine, of a shaft extending transversely of the frame, cutting mechanism pivoted to said shaft and provided with oppositely-disposed cam-edges, and a rod extending through said slats and having its ends held in guiding-slits in which the rod is moved back and forth and connected with some movable part of the machine for actuating the blades of the cutting mechanism, substantially as set forth.

12. In a machine of the character described, the combination with the frame and its rolling-table, of cutting mechanism arranged at one end of the frame and consisting of two oppositely-disposed blades arranged between the two edges of the apron and projecting through suitable openings therein and one of which projects above the surface of the rolling-table and the other of which fits with or below the surface and in advance of the first-named blade, and connections between some movable part of the machine for actuating the blades by the movement of the machine, substantially as set forth.

13. In a machine of the character described, the combination with the frame, the top piece of which is provided with a rolling-table, depressions arranged at the top forwardly and rearwardly of the rolling-table, of an apron extending over the rolling-table and depressions and fixed at its ends, a reciprocating carriage provided with a shaping-roller to travel over said table, cutting mechanism located in the depressions at the rear end of the table, and connections between the cutting mechanism whereby the cutting mechanism is actuated by the movement of the carriage to trim the ends of the rolled work, substantially as set forth.

14. In a machine of the character described, the combination with the frame provided with journal-brackets having a lag projecting therefrom, of a longitudinally-divided shaft, an apron clamped between the divided parts of said shaft, a wheel mounted to one end of the shaft and adapted to coast with the lag projecting from the journal-brackets, and a spring confined between a fixed part of the machine and a shoulder on said shaft entering in co-operation to hold the notched wheel into engagement with the fixed lag, substantially as set forth.

15. In a machine of the character described, the combination with the frame consisting of front and rear pieces and a top connecting the two together, the front and rear pieces being provided with roller-bearings, of a rolling-table secured to the top, track-rolls connecting the front and rear pieces, a carriage mounted to slide upon said track, an apron secured to said frame over the rolling-table, and a rope secured to said carriage having one end passed around a pulley carried by the front end piece and having both its ends then passed around a pulley carried by the rear end piece and connected to a tensioner, substantially as set forth.

16. In a machine of the character described, the combination with a rolling or supporting table formed of a series of interchangeable parallel slats, of interchangeable bunching-rollers of different shapes operating over said table and provided with a periphery of varying diameter.

17. In a machine of the character described, a rolling or supporting table having a curved upper surface formed of a series of interchangeable slats, combined with a bunching-roller operating over said table and having different diameters at different points in its length.

18. In a machine of the character described, a rolling or supporting table having a curved upper surface formed of a series of interchangeable parallel slats spaced apart, combined with a bunching-roller operating over said table, the periphery of the roller having a curvature opposite that of the upper surface of the table to produce a shape of a shape opposite that of the roller.

699,808. REEFL-PAD FOR GUNS. JAMES E. WILSON, Clinton, Mo. Filed July 25, 1901. Serial No. 69,368. (No model.)

Claim.—1. The reepl-pad herein described, comprising the air-chamber composed of inner and outer flexible walls united directly together at their outer edges, whereby the air-chamber will form an substantial projection beyond the end of the gun-stock at the upper and lower edges thereof, the sleeve extending from the outer edge of the air-chamber, and adapted to embrace the stock, and the filling-tube arranged within

the said sleeve and connected with the inner wall of the air-chamber, substantially as set forth.

2. A reepl-pad for guns, having an air-chamber composed of inner and outer walls, and a sleeve extending from the outer edge thereof and adapted to embrace the rear end of the gun-stock, and the filling-tube located within said sleeve and connected with the inner wall of the air-chamber, substantially as set forth.

3. A reepl-pad for guns, comprising the air-chamber having inner and outer walls, said walls being united directly together at their outer edges, that is to say without any intervening connecting portions whereby to avoid any substantial projection beyond the end of the stock at the edges thereof, and the sleeve projecting from the outer edge of the pad and adapted to embrace the rear end of the gun-stock, substantially as set forth.

4. A reepl-pad for guns, comprising an air-chamber composed of inner and outer walls united directly together at their outer edges that is to say without any intervening connecting portions and provided along said edges with means whereby the pad may be secured to the butt-end of the gun-stock, substantially as set forth.

5. The combination of the gun-stock, the reepl-pad having inner and outer walls united directly together at their edges and provided at each edge with a projecting sleeve to embrace the butt-end of the stock, and a cover fitting over said pad and stock, and held in position, substantially as set forth for the purposes set forth.

699,809. NON-REFILLABLE BOTTLE. JAMES E. WILSON, Clinton, Mo., assignor of one-half to William A. Jacobs and George L. Sloan, Baltimore, Md. Filed July 15, 1901. Serial No. 67,402. (No model.)

Claim.—1. A non-refillable bottle, comprising a valve-actuating lever having a valve-seat, a flap-valve on the said casing to close and open the said seat, a weighted ball flexibly connected with the said valve and extending within the valve-casing, and a spring connected with the said valve for drawing the latter to its seat, as set forth.

2. A non-refillable bottle, comprising a valve-actuating lever having a valve-seat and provided with a yoke, a flap-valve on the said casing to close and open the said seat, a weighted ball flexibly connected with the said valve and extending within the valve-casing, and a spring connected with the said valve for drawing the latter to its seat, the said spring extending downwardly through the valve-seat to connect with a yoke carried by the said casing, as set forth.

3. A non-refillable bottle, comprising a bottle having an annular recess in the neck thereof, a valve-actuating lever having an inclined ring adapted to engage the annular recess in the neck of the bottle, a bar depending from the said casing and having an aperture for engaging a projection in the neck of the bottle, and a valve in the said casing normally held to its seat adapted to open on tilting the bottle, as set forth.

4. A non-refillable bottle, provided with a casing, having a valve-seat, a valve for the said valve-seat and provided with a resilient-plate, a spring for normally holding the valve closed, and a weighted ball having a flexible connection with the said valve to open the same on tilting the bottle, the said ball being adapted to rest on a resilient-plate of the valve, as set forth.

5. A non-refillable bottle having a valve-actuating lever having a valve-seat and provided in its top with an aperture near its periphery, the said casing having a film top provided with a central aperture, the wall of the casing being provided with cut-out portions in its periphery and between the said top with apertures leading to the cut-out portions forming spaces between the upper end of the casing and the inner surface of the neck of the bottle, as set forth.

6. A non-refillable bottle having a spring-pressed valve in its neck,

and a weight connected with the valve for opening the same when the bottle is tilted, as set forth.

7. In a non-refillable bottle, a casing held in the neck of the bottle and having a valve-out in its lower portion and a circular outlet at its top, a spring-pressed valve on said valve-out, and a spherical weight within the casing and loosely connected with the valve, as set forth.

699,610. FOOT-CLIP FOR TREADLES OF SEWING-MACHINES.
ARTHUR EYRE, Providence, R. I. Filed Sept. 14, 1901. Serial No. 78,411.
(No model.)

Claim.—1. In combination with a treadle of a machine, of a foot-clip consisting of a metallic strip, of resilient material, having a flat central portion provided with a square-shaped opening with two extensions from said flat portion, each of which extensions is curved in the arc of a circle, with a bolt having one portion of its shank square-shaped to fit in the opening of said foot-clip and its opposite portion diametrically cross-threaded to receive a washer and nut, respectively, to hold said clip in position upon the treadle, substantially as shown and described.

2. The herein-described foot-clip A having a central flat portion with outwardly-curved wings or extensions b b therefrom, said flat portion provided with a square-shaped opening, the bolt d having an enlarged head d' and having its shank provided with a square-shaped portion d'' having a head, of a size to enter the opening of said foot-clip, and the opposite end of said bolt provided with an exterior cross-threaded surface, with a washer and nut, respectively, to engage upon the threaded portion of said bolt, as shown and described.

699,611. BAG-MACHINE. LEONARD B. BROWN, Perth, N. J., assignor to Lester G. Fisher, Chicago, Ill. Filed Aug. 2, 1900. Serial No. 725,000. (No model.)

Claim.—1. In a paper-bag machine, in combination with the feed-rolls and knife-edge thereof, an electrically-actuated covering device consisting with said knife-edge, of a commutator rotatably carried on a swinging shaft which is actuated by suitable intermeshing gears from the roller-shaft, and of suitable adjustable contact-points, with said commutator, arranged to regulate the action of said covering device, for the purpose described.

2. In a paper-bag machine, the combination with the feed-rolls and knife-edge thereof, a covering device consisting with said knife-edge, and actuated by a suitable electromagnetic device, a commutator substantially as described rotatably carried on a swinging shaft adapted to carry differential gearing for regulating the speed of said shaft, a series of contact-points with the said commutator adjustably carried on the machine, and means for alternately throwing into circuit suitable electromagnets which actuate the covering device, substantially in the manner described.

3. In a device of the character described comprising the feeding device and covering device, the electromagnet for actuating the covering device, the circuit containing the magnet, devices for controlling the circuit through the magnet carried by an adjustable support and means operated by the paper-feeding device for actuating the circuit-controlling device, substantially as described.

699,612. COATING-MACHINE. GEORGE A. BROWN, Newark, N. J., assignor to the Whitehead & Berg Company, Newark, N. J., a Corporation of New Jersey. Filed July 12, 1901. Serial No. 67,000. (No model.)

Claim.—1. In a coating-machine, a supply-tank and coating-roller movable thereon, in combination with an adjustable deflector plate or bar for forcing the article to be coated into contact with the roller.

2. In combination with a supply-tank, coating-roller and means for feeding the article to be coated to the upper face of the coating-roller, an additional roller above the coating-roller for feeding the coated article from the coating-roller, and stripper-fingers for deflecting the coated article from the coating-roller to the latter feeding-roller.

3. In combination with a supply-tank, coating-roller and means for feeding the article to be coated to the coating-roller, additional means for feeding the coated article from the coating-roller and a scraper-gage between the coating-roller and latter feeding means for evening the coated surface of the article.

4. In combination with a supply-tank, coating-roller and means for feeding the article to be coated to the coating-roller, additional means for feeding the coated article from the coating-roller and a scraper-gage between the coating-roller and latter feeding means for evening the coated surface of the article, and a guide or pressure bar for forcing the coated surface of the article against the scraper-gage.

5. In combination with a supply-tank, coating-roller and means for feeding the article to be coated to the coating-roller, additional means for feeding the coated article from the coating-roller and a scraper-gage between the coating-roller and latter feeding means for evening the coated surface of the article, and an adjustable guide or pressure bar engaged with the coated surface of said article for forcing the coated surface against the scraper.

6. The combination with a coating-roller and feed-roller arranged to feed the article to and from the coating-roller, a scraper-gage between the coating-roller and feed-roller for scraping the coated surface, and stripper-fingers between the gage and coating-roller for the purpose set forth.

7. The combination with a tank for the coating material, coating-roller having its lower face movable in the tank; feed-rollers arranged to feed the article to and from the upper face of the coating roller, and independently-movable scraper-fingers beneath said article for deflecting the coated article from the coating-roller to the feed-roller.

8. The combination with a coating-roller and feed-rollers arranged to feed the article to and from the coating-roller, a scraper-gage between the coating-roller and an outfeed-roller for scraping the coated surface, and stripper-fingers adjustably mounted on the scraper-gage for the purpose described.

9. The combination with a coating-roller and feed-rollers arranged to feed the article to and from the coating-roller, a scraper-gage between the coating-roller and an outfeed-roller for scraping the coated surface, independently-movable scraper-fingers between the gage and coating-roller for the purpose set forth, and a guide or pressure bar engaging the coated surface for forcing the coated surface against the scraper-gage.

10. The combination with a coating-roller and feed-rollers arranged to feed the article to and from the coating-roller, the outfeed-roller being in a plane above the coating-roller, a deflector-plate for feeding the article

downwardly from the infeed against the coating-roller, and stripper-fingers for deflecting the coated article upwardly from the coating-roller to the outfeed.

11. The combination with a coating-roller and feed-rollers arranged to feed the article to and from the coating-roller, the outfeed-roller being in a plane above the coating-roller, a deflector-plate for feeding the article downwardly from the infeed against the coating-roller, and independently-movable scraper-fingers for deflecting the coated article upwardly from the coating-roller to the outfeed.

12. The combination with a coating-roller and feed-rollers arranged to feed the article to and from the coating-roller, a deflector-plate for feeding the article from the infeed against the coating-roller, and stripper-fingers for deflecting the coated article from the coating-roller to the outfeed, and a scraper-gage between the strippers and outfeed-roller for equalizing the thickness of the coating.

13. The combination with a tank for the coating material, a coating-roller having its lower portion movable in the tank, feed-rollers arranged to feed the article to and from the coating-roller, a scraper having a beveled edge inclining downwardly away from the coating-roller and arranged to regulate the thickness of the coating on the coating-roller before being applied to the article and to break the air-bubbles in the coating, a plate or bar for deflecting the article downwardly from the infeed to the coating-roller, and stripper-fingers for deflecting the coated article upwardly from the coating-roller to the outfeed.

14. The combination with a coating-roller and feed-rollers arranged to feed the article to and from the coating-roller, of a drive belt or conveyor to receive the coated article from the outfeed-roller, and a stripper arranged to deflect the coated article from the latter roller to the belt.

15. A coating-machine comprising a coating-supply tank, means for maintaining a predetermined level of coating material in said tank, a coating-roller having a portion thereof movable in the coating material of the tank, infeed-rollers for feeding the article to be coated to the coating-roller, an adjustable scraper-bar arranged to regulate the thickness of the coating adhering to the coating-roller before being applied to the article, an adjustable deflector-plate between the infeed and coating rollers for forcing the article into contact with the coating-roller, stripper-fingers for deflecting the coated article from the coating-roller to the outfeed-roller, a scraper-gage for evening and regulating the thickness of the coating on the article after leaving the stripper-fingers, a drive-belt, and a second stripper for deflecting the coated article from the outfeed-roller to the belt.

699,613. MACHINE FOR FINISHING METAL ARTICLES.
HENRY H. DAVIS, Hastings, Mich., assignor to the Rustic Creek Iron Works Company, Limited, Bathurst, Mich. Filed June 12, 1900. Serial No. 64,490. (No model.)

Claim.—1. The combination of a chuck-carrier, a chuck provided with a jaw actuator, a clutch arranged to engage therewith, a positively-

driven clutch-actuator, and friction-gearing between the clutch and its driver, substantially as described.

2. The combination of a chuck-carrier, a plurality of chucks, jaw-actuators on the chucks, a clutch adapted to engage the jaw-actuators, and also the jaws, friction-gearing adapted to allow the clutch to stop while in driving means it is in action, and means for regulating the tension of the friction-gearing, substantially as described.

3. The combination of a chuck-carrier, driving mechanism therefor, a stop mechanism acting alternately with the driving mechanism, non-rotatable chucks or collets on said carrier, actuators adapted to operate the jaws of said collets, and a clutch arranged to engage said actuators to operate the jaws of the chuck during the period of rest of said carrier.

4. The combination of a chuck-carrier, non-rotatable chucks or collets thereon, means for operating the jaws of said chucks, a driving mechanism for said carrier arranged to act intermittently, a stop mechanism acting alternately with the driving mechanism, a gang of rotatable tool-spindles mounted in a reciprocating carriage and so arranged that the tools therein shall operate upon the work in said chucks, at one end of the reciprocation of the reciprocating carriage, and means for reciprocating the tool-carriage.

5. The combination of a chuck-carrier arranged to rotate, chucks provided with jaw-actuators adapted to operate by rotating, mounted in the chuck-carrier, a rotating shaft mounted in a stationary bearing, and means for engaging and disengaging said shaft with said jaw-actuators.

6. The combination of a chuck-carrier arranged to rotate, chucks provided with jaw-actuators adapted to operate by rotating, mounted in the chuck-carrier, two rotating shafts mounted in stationary bearings and rotating in opposite directions and means for engaging and disengaging said shafts alternately with said jaw-actuators.

7. A means for actuating the jaws of a chuck, comprising a spindle, a clutch-head secured to said spindle, a disk secured to said spindle, a driving-wheel journaled on the spindle, and adapted to have frictional engagement with the disk, a spring arranged to produce longitudinal movement of the spindle in its bearings, a cam-driver arranged to produce longitudinal movement of the spindle in its bearings against the tension of said spring, substantially as described.

8. A means for actuating the jaws of a chuck, comprising a spindle, a clutch-head secured to said spindle, a disk secured to said spindle, a driving wheel journaled on the spindle, and adapted to have frictional engagement with the disk, a spring arranged to produce longitudinal movement of the spindle in its bearings, a cam-driver arranged to produce longitudinal movement of the spindle in its bearings against the tension of said spring, a spring arranged to hold said disk and wheel in frictional contact, and means adjusting the tension of said spring, substantially as described.

699,614. BALL-BEARING. HERBERT E. CLARK, Worcester, Mass. Filed Jan. 22, 1900. Serial No. 607,004. (No model.)

Claim.—1. In a ball-bearing device, the combination with a journal, of outer and inner sleeves surrounding the journal, a series of balls interposed between the sleeves, a housing on the journal adapted to slide thereon when the rolling friction is interrupted, rings at either end of the journal whereby to retain the ball-bearings and act as stops therefor, and a flanged nut at the free end of the journal to maintain the parts in proper relation to one another.

2. In a ball-bearing device, the combination of a journal, a chamber in which balls may run around the journal, said chamber consisting of an inner sleeve and an outer sleeve, and a series of balls interposed between said inner and outer sleeves, and an intermediate housing adapted to slide around said journal when rolling friction is interrupted, substantially as set forth for the purpose set forth.

3. In a ball-bearing device, the combination with a journal, of an outer and an inner sleeve surrounding said journal and forming a cham-

bar, balls arranged within said chamber, rings arranged within said chamber and dividing the balls into smaller rows, an intermediate bushing arranged to slide when rolling friction is interrupted, and a washer provided with balls to receive the end thrust of the bar, substantially as and for the purpose set forth.

4. In a ball-bearing, the combination with a journal, a hard bushing surrounding the journal, and a plurality of sleeves surrounding the bushing, of rows of balls interposed between the sleeves, rings of varying width between each two rows of balls, hardened rings at either end of the sleeves, packing for receiving the end thrust of the journal, ball-bearing washers at either end of the journal, packing for excluding foreign material, and a nut removably secured on the outer end of the journal, the nut provided with a flange designed to retain the parts in place.

5. In a ball-bearing, the combination with a journal, a hard bushing surrounding the journal, and a plurality of sleeves surrounding the bushing, of rows of balls interposed between the sleeves, rings of varying width between each two rows of balls, hardened rings at either end of the sleeves, packing for receiving the end thrust of the journal, ball-bearing washers at either end of the journal, rollers removably secured at either end of the outer sleeve, a dust-cap removably secured by the collar on one end of the outer sleeve, for excluding foreign material, and a nut removably secured on the outer end of the journal, the nut provided with a flange designed to retain the parts in place.

6. In a ball-bearing, the combination with a journal, a hard bushing surrounding the journal, and a plurality of sleeves surrounding the bushing, of rows of balls interposed between the sleeves, rings of varying width between each two rows of balls, hardened rings at either end of the sleeves, packing for receiving the end thrust of the journal, ball-bearing washers at either end of the journal, packing for excluding foreign material and a nut removably secured on the outer end of the journal, the nut provided with a flange designed to retain the parts in place, the outer end of the journal provided with an aperture to receive a cotter-pin whereby to prevent the accidental displacement of the nut.

7. In a ball-bearing, the combination with a journal, of a bushing, a plurality of sleeves spaced apart from each other, the innermost sleeve secured on the bushing against rotation thereon, rows of balls interposed between the sleeves, means for separating the rows of balls, ball-bearing washers and a flanged nut fitting upon the journal for retaining the parts in place.

8. In a ball-bearing, the combination with a journal, of a bushing surrounding the journal, the bushing capable of being made to fit any size of journal, sleeves surrounding the bushing, the inner sleeve secured on the bushing against rotation thereon, rows of balls interposed between the sleeves, means interposed between the rows of balls to retain them in predetermined lines of travel, and means secured on the journal for retaining the parts in place.

9. In a ball-bearing, the combination with a journal, of a bushing surrounding the journal, the bushing capable of being made to fit any size of journal, sleeves surrounding the bushing, the inner sleeve secured on the bushing against rotation thereon, rows of balls interposed between the sleeves, means interposed between the rows of balls to retain them in predetermined lines of travel, rings located at either end of the sleeves, collars to which the outer sleeve is secured, means secured on the journal for retaining the parts in place, and a dust-cap removably secured to the outer collar.

699,615. WARPING-MACHINE. JEREMIAH W. DUNN, JR., and JAMES JACOB, Ritten, N. Y. Filed Jan. 27, 1902. Serial No. 91,268. (No model.)

Claim.—1. In a warping-machine, a beam-frame, warp-beams mounted upon said beam-frame, hand-wheels secured to said warp-beams, friction-drums secured to said warp-beams, friction-ropes engaging said drums, clamp-levers connected to said clamps and carrying adjustable weights to form tension devices for said warp-beams, a winding-frame mounted adjacent said beam-frame, a winding-beam mounted in said winding-frame, a worm-wheel secured to said winding-beam, driving-gear including a hand-wheel, engaging said worm-wheel, a presser to cooperate with said winding-beam, a cutting-table mounted on said winding-frame and provided with cutting-grooves and a loop-dot, a winding-clamp mounted adjacent said cutting-table, cringing clamping-tables mounted on said beam-frame to cooperate with said cutting-table, and leashes to secure either of said clamping-tables to said cutting-table, each of said clamping-tables being provided with a rod and a table-clamp.

2. In a warping-machine, a beam-frame to support a plurality of warp-beams, a winding-frame carrying a winding-beam and means to rotate said winding-beam, a cutting-table secured to said winding-frame, said cutting-table being formed with a series of parallel transverse cutting-grooves and with a transverse loop-dot adjacent said cutting-grooves to form a series of equal loops in warp-threads and a winding-clamp on said winding-frame adjacent said cutting-table.

3. In a warping-machine, a beam-frame carrying warp-beams, a winding-frame carrying a winding-beam, means to rotate said winding-beam, a cutting-table secured to said winding-frame, movable clamping-tables mounted on said beam-frame to cooperate with said cutting-table and means to clamp a series of warp-threads upon said cutting-table and said clamping-tables.

4. In a warping-machine, a beam-frame, a plurality of warp-beams revolvably mounted in said beam-frame, a winding-frame, a winding-beam mounted in said winding-frame, a cutting-table secured to said winding-frame, a plurality of clamping-tables secured to said beam-frame, each of said clamping-tables being adapted to cooperate with said cutting-table and means to clamp a series of warp-threads upon said cutting-table and upon said clamping-tables.

5. In a warping-machine, a beam-frame, a plurality of warp-beams mounted in said beam-frame, a winding-frame mounted adjacent said beam-frame, a winding-beam in said winding-frame, driving mechanism for said winding-beam, a presser to cooperate with said winding-beam and a clamp secured to said winding-frame to clamp a series of warp-threads.

6. In a warping-machine, a beam-frame having bearings for a plurality of warp-beams, a winding-frame to support a winding-beam, a clamp upon said winding-frame to engage a series of warp-threads and means to rotate said winding-beam to alternately wind threads from each of said warp-beams.

7. In a warping-machine, a beam-frame, a plurality of warp-beams revolvably mounted in said beam-frame, movable clamping-tables mounted on said beam-frame, means to clamp a series of warp-threads upon said clamping-tables, a winding-frame mounted adjacent said beam-frame, a winding-beam in said winding-frame and driving mechanism for said winding-beam.

8. In a warping-machine, a beam-frame, a plurality of warp-beams mounted in said beam-frame, movable clamping-tables mounted on said beam-frame, means to clamp a series of warp-threads from said beams upon said clamping-tables and a winding-frame having a winding-beam mounted therein adjacent said beam-frame.

9. In a warping-machine, a beam-frame, a plurality of warp-beams mounted in said beam-frame, movable clamping-tables mounted on said beam-frame, each of said clamping-tables being provided with a rod and a table-clamp to engage warp-threads from said warp-beams.

10. In a warping-machine, a beam-frame to carry a plurality of warp-beams and clamping-tables being provided with a rod and a table-clamp to engage warp-threads from said warp-beams.

11. In a warping-machine, a beam-frame to carry warp-beams, a winding-frame mounted adjacent said beam-frame, means to rotate said winding-beam, a cutting-table provided with cutting-grooves and with a

loop-dot secured to said winding-frame and a winding-clamp mounted adjacent said table.

12. In a warping-machine, a winding-frame to carry a winding-beam, means to rotate said winding-beam, a cutting-table provided with cutting-grooves and with means to form loops in warp-threads mounted on said winding-frame and a winding-clamp adjacent said table.

13. In a warping-machine, a winding-frame to carry a winding-beam and a cutting-table provided with a loop-dot mounted on said winding-frame.

699,616. VELVET CARPET AND PROCESS OF MAKING SAME. JAMES W. DUNN, JR., and JAMES JACOB, Ritten, N. Y. Filed Jan. 27, 1902. Serial No. 91,268. (No model.)

Claim.—1. The process of making carpet comprising printing warp-threads with a quarter-section design and with knotting-sections at the ends of said quarter-section design, spreading and bending the part of said warp-threads to form a direct warp, spreading and bending another part of said warp-threads to form a reverse warp, covering and knotting said knotting-sections of said direct and reverse warps to form a compound warp composed alternately of direct and reverse warp-sections, weaving a velvet carpet with said compound warp as a pattern-warp, inserting a loop-rod under the knots in said compound warp at the center of the pattern to raise said knots from the surface of the fabric, cutting out said loop-rod and removing the upstanding ends of said knotting-sections to form a full-length strip comprising two symmetrical quarter-section patterns; in reversing said compound warp from right to left and in weaving a similar full-length strip therefrom to produce a second strip symmetrical to the first.

2. The process of making carpet which comprises printing pattern-warps with a quarter-section design and with knotting-sections at the ends of said quarter-section design, covering said pattern-warps at said knotting-sections, cutting and assembling said pattern-warps to form a compound pattern-warp having a full-length symmetrical design comprising two of said quarter-section designs and weaving said compound warp as the pattern-warp of a carpet to produce a strip comprising two of said quarter-section designs.

3. The process of making carpet which comprises printing warp-threads with a quarter-section design, covering, joining and assembling said warp-threads to form a compound warp comprising two of said quarter-section designs and weaving said compound warp as the pattern-warp of a carpet to produce a strip comprising two of said quarter-section designs symmetrical about the middle of said strip.

4. The process of making carpet which comprises printing warp-threads with a quarter-section design and producing a fabric from said warp-threads after joining the same, said fabric comprising a design formed of two of said quarter-section designs symmetrical arranged.

5. The process of making fabric which comprises printing warp-threads with a section design and with knotting-sections, covering said warp-threads at said knotting-sections, cutting and assembling said warp-threads to form a compound warp embodying a series of said section design and weaving said compound warp to produce a pattern fabric embodying a multiple design.

6. The process of making fabric which consists in producing colored warp-threads, cutting and assembling said warp-threads to produce a compound warp embodying a compound design and in weaving said compound warp to produce a fabric embodying said compound design.

7. The process of making fabric which consists in printing warp-threads with a section design, cutting and assembling said warp-threads to form a compound warp embodying a multiple design and in weaving said warp.

8. The process of making fabric which comprises printing warp-threads with a section design, cutting said warp-threads to form a multiple warp and producing a fabric from said multiple warp embodying a multiple design formed of a plurality of said section design.

9. A carpet formed of right and left hand strips said strips comprising symmetrical pattern-warps formed of united section warps printed with a section design and united symmetrically.

10. A carpet comprising compound pattern-warps symmetrical about the center of the same, said compound warps being formed of section pattern-warps symmetrically united.

11. A carpet comprising compound pattern-warps symmetrical about the center of the same, said compound warps being formed of two quarter-section pattern-warps symmetrically united.

12. A carpet comprising symmetrical pattern-warps formed of section warps printed with a quarter-section design and united symmetrically.

13. A fabric comprising compound pattern warp-threads, said compound warp-threads being formed of joined section warp-threads.

14. A fabric comprising compound pattern warp-threads said compound warp-threads being formed of joined colored section warp-threads.

15. A compound warp composed of section warp-threads printed with a quarter-section design and with knotting-sections and united at said knotting-sections to form compound warp-threads having a symmetrical design formed of two of said quarter-section designs.

16. A compound warp formed of a plurality of section pattern-warps united to form a compound design comprising said section designs.

17. The process of forming a compound warp which consists in printing warp-threads with a quarter-section design and with knotting-sections, in covering said warp-threads and uniting said knotting-sections to form a compound warp having symmetrically-arranged quarter-section designs.

18. The process of forming a compound warp which consists in printing warp-threads with a quarter-section design, in covering and uniting said warp-threads to form a compound warp having symmetrically-arranged quarter-section designs.

19. The process of producing a compound warp which consists in printing warp-threads with a section design, in covering and uniting said warp-threads to produce a warp having a compound design composed of said section designs.

20. The process of producing a compound warp which consists in producing colored warp-threads, in cutting and in assembling said warp-threads to produce a warp having a compound design.

21. The process of producing a compound warp which consists in printing warp-threads with a section design and in uniting said warp-threads to produce a warp having a compound design composed of said section designs.

699,617. RAIL. OLIVER C. RAIL, Allegheny, Pa. Filed Sept. 22, 1902. Reissued Oct. 12, 1901. Serial No. 73,493. (No model.)

Claim.—In a device of the character described, a round shank, a head on one end thereof, said head having formed on opposite sides of its free end a single pair of inclined cut away portions, a single pair of shoulders on said portions, and a single arrow-shaped projection made integral with said free end, in combination with a round shank, a head on one end thereof, the other end having formed therein a single pair of inclined recesses, a single pair of shoulders for the reception of the said arrow-shaped projection whereby the two members are driven into positive locking engagement with one another and when in this position the said round shanks are of uniform thickness throughout, substantially as described.

699,618. RAIL-ROAD. AXEL H. RAIL, Philadelphia, Pa., assignor to the Protected Rail Road Company, Philadelphia, Pa., a Corporation of Pennsylvania. Filed Mar. 2, 1902. Serial No. 92,008. (No model.)

Claim.—1. A rail head consisting of two heads united by a body formed in two divisions of unequal transverse dimensions or mass.

2. A rail head the body of which is formed in two divisions one of said divisions being of greater height than the other.

3. A rail head having a body arranged in two divisions each consisting of a series of ribbons like strands arranged face to face, one of said divisions having a series of such strands in excess of the number present in the other division.

4. In combination, a pair of meeting rail ends, a pair of splices here mounted on said rail ends in such manner that a head space exists between a splice bar and the side flange of the rails, bolts extending through said bar and rails, and unequally dividing vertically, the head space, and a rail head mounted in said space and making connection with the rail ends, the body of said head being formed of strands, arranged in two divisions of unequal diametric mass, the smaller of said divisions being located in the smaller portion of the head space and the larger of said divisions being located in the larger portion of said head space, substantially as set forth.

699,619. COMBINATION DROP AND JACK FOR TELEPHONE-LINES. SWITZERLAND. HENRY H. FINE, Weston, N. H. Filed June 20, 1900. Serial No. 21,200. (No model.)

Claim.—1. In a combined indicator and jack for telephone-lines, the combination of a socket, a suitable plug adapted to enter said socket, a drop-chamber in close proximity to said socket and a slide adapted to engage with the tip of said plug to be moved horizontally thereby and adapted to cooperate with the said drop-chamber to restore the same; said slide being so formed that a vertical movement is imparted to the end cooperating with the drop-chamber when said slide actuated by said plug rises horizontally over a suitable bearing, whereby the drop-chamber is restored to its normal position with greater certainty.

2. The combination of a drop, a device constructed and arranged to be moved bodily by and travel with a plug and means for simultaneously raising said device to close the drop.

3. The combination with a jack-socket and a drop, of a longitudinally-movable slide having a portion to be engaged by a plug, and a cam for causing the slide to rise and restore the drop when the plug is moved longitudinally in the jack-socket.

4. The combination with a drop, a jack socket and a front piece having a slot, of a slide adapted to be moved by a plug, projecting through the slot and having a cam to engage the wall of the slot and raise the slide to restore the drop.

5. The combination with a drop and jack-socket, of a slide projecting beyond the drop and adapted to receive it when it falls, as are depending from the slide into the jack-socket and adapted to be actuated by a plug and a cam to effect the elevation of the slide to restore the drop.

6. In a combined indicator and jack device for telephone-lines, the combination with the jack having a socket, of a suitable plug adapted to enter said socket, a drop-chamber pivoted upon the front of said device above the socket and in close proximity thereto, a longitudinally-movable slide mounted in said device above the socket and having a downwardly-turned end extending into the path of the plug when the plug is inserted in the socket, the outer end of said slide being turned upwardly so as to stand in front of said drop-chamber, whereby when the drop-chamber is down and the plug is inserted in the socket, its tip engages the downwardly-turned end of the slide and causes the slide to travel inwardly with the plug while the said outer upward end of the slide engages the drop-chamber and restores the same, substantially as described.

699,620. VAULT OR GRAVE. THOMAS B. HARKINS and F. J. VINTAGE, New Haven, Ind. Filed Jan. 11, 1902. Serial No. 20,202. (No model.)

Claim.—1. A burial-vault or grave comprising a socket-bar having cross-bars on its top, and a wall surrounding the said bar, the ends of the cross-bars projecting beyond the sides of the bar and being embedded in the wall.

2. A burial-vault or grave comprising a socket-bar, cross-bars permanently secured on the top of the bar, permanent loops or rings rising from the cross-bars, and an impervious wall surrounding said bar in which said cross-bars and loops or rings are embedded.

3. The combination with an impervious wall and a socket-bar surrounded closely by said wall, of cross-bars on the top of said bar having loops at their ends embedded in said wall, and rings rising from the cross-bars and likewise embedded in the said wall.

4. In a burial-vault, the combination with an impervious wall, and a socket-bar surrounded thereby and having openings in its bottom near its ends, of tubes inserted in said openings and having ends on their lower ends beneath the bar embedded in the said wall, the openings of the tubes extending through the said ends and the said ends having horizontal openings through which the material of the wall passes.

699,621. LIQUID-MEASURING DEVICE. SYLVEN R. BARNETT, Kansas City, Mo., assignor to Edgar J. Barnette, individually and as trustee, Patrons, Kans. Filed June 20, 1901. Serial No. 20,203. (No model.)

Claim.—1. A measuring device, comprising a cylindrical casing, a partition dividing the same horizontally and provided with a depending funnel, a valve-opening depending from said funnel through the bottom of the casing, having openings, caps of varying capacity arranged one within the other and surrounding the valve-opening, the topmost cap communicating with the two uppermost openings, and the remaining caps and the cylindrical casing each with one of the remaining openings, and a tubular valve fitting snugly in the valve-opening and provided with openings, and an internal partition between the topmost and the remaining openings, the topmost opening being adapted to register with the corresponding opening of the valve-opening non-concurrently with the registration of the remaining valve-openings and valve-opening openings; said remaining openings, beginning at the top, registering successively with the said remaining valve-opening openings, substantially as described.

2. A measuring device, comprising a cylindrical casing, a partition dividing the same horizontally and provided with a depending funnel, a valve-opening depending from said funnel through the bottom of the casing, having openings, caps of varying capacity arranged one within the other and surrounding the valve-opening, the topmost cap communicating with the two uppermost openings, and the remaining caps and the cylindrical casing each with one of the remaining openings, a tubular valve fitting snugly in the valve-opening and provided with openings, and an internal partition between the topmost and the remaining openings, the topmost opening being adapted to register with the corresponding opening of the valve-opening non-concurrently with the registration of the remaining valve-openings and valve-opening openings; said remaining openings, beginning at the top, registering successively with the said remaining valve-opening openings, a wrench or lever secured to operate the valve, a dog carried thereby, and a band or ring provided with notches to receive the dog accordingly as the device is to be filled or varying quantities are to be discharged therefrom, substantially as described.

3. A measuring device, comprising a cylindrical casing having a horizontal partition and provided with caps of varying capacity below said partition, and valve mechanism whereby said caps may be charged or relieved of their charge, a pipe for supplying liquid to the casing above said partition, an indicator, comprising a transparent cylinder, caps secured upon its opposite ends and provided with longitudinal passages, a reciprocity valve conveying the passage of the upper cap, a tube connecting the passage of the lower cap with the upper end of the lower chamber of the cylindrical casing, a notched flange surrounding the upper end of said lower cap, and a float within the transparent cylinder normally resting upon said notched cap without interfering with the passage of the air, but adapted when liquid enters said cylinder to rise and seat said reciprocity valve, and adapted as the discharge from the de-

vice taken place to descend and permit said valve to open, substantially as described.

699,622. MANUFACTURE OF PLAYING-BALLS. BRADMAN KEMPSTALL, Boston, Mass., assignor to The Kempshall Manufacturing Company, a Corporation of New Jersey. Filed Jan. 20, 1902. Serial No. 21,201. (No model.)

Claim.—1. A process in producing a playing-ball, consisting in curing a thick rubber envelop upon a compressible core, so that the expansion of the rubber in the curing process condenses said core, and also so that when the ball is removed from the mold said core recovers at least partially its original bulk and places said envelop under tension.

2. A process in producing a playing-ball, consisting in curing a rubber envelop upon a compressible core of gutta-percha, so that the expansion of the rubber in the curing process condenses said core, and also so that when the ball is removed from the mold said core recovers at least partially its original bulk and places said envelop under tension.

699,623. MANUFACTURE OF GOLF-BALLS. BRADMAN KEMPSTALL, Boston, Mass., assignor to The Kempshall Manufacturing Company, a Corporation of New Jersey. Filed Mar. 12, 1902. Serial No. 21,202. (No model.)

Claim.—1. A process in producing a playing-ball, consisting in forming a rubber sphere, covering said sphere with a gutta-percha shell, applying plastic or fluid coating to said shell, and hardening said coating so as to form a casing upon said shell.

2. A process in making a playing-ball, consisting in forming a yielding core, covering said core with hemispherical segments of gutta-percha, covering the latter with a plastic or fluid coating, hardening said coating so as to form a casing, and compressing said casing upon the ball.

3. A process in making a playing-ball, consisting in placing a yielding core within a gutta-percha shell, covering the whole with a celluloid solution, and effecting a hardening and compression of said coating under heat, so as to form a casing upon the shell.

4. A process in making a playing-ball, consisting in covering a soft core with a gutta-percha shell, covering the shell with successive layers of celluloid, hardening one layer before the next is applied, and applying thereto simultaneously heat and compression, so as to compact the same into a stiff, springy casing.

5. A process in making a playing-ball, consisting in applying a gutta-percha shell to a rubber core, covering said shell with successive layers of plastic or fluid material, and hardening each layer before the casing is applied, then subjecting the whole to heat and compression and maintaining the compression while the ball cures.

6. A process in making a playing-ball, consisting in applying upon a compressed core whereof the outer portion consists of a distended rubber envelop, a shell consisting of at least partially of compressed gutta-percha, adding a plurality of layers, one after another, of fluid or plastic material, drying or partially curing one layer before another is applied, and subjecting the whole to heat and compression to an extent to weld said layers and place said rubber envelop under compression, and maintaining the compression while the ball cures.

699,624. GOLF-CLUB. BRADMAN KEMPSTALL, Boston, Mass., assignor to The Kempshall Manufacturing Company, a Corporation of New Jersey. Filed Apr. 2, 1902. Serial No. 21,203. (No model.)

Claim.—1. A club having a head, and a flange upon said head consisting of celluloid and fabric.

2. A club having a head, and a flange upon said head consisting of plastic material and fibrous material, the latter being embedded in the plastic material.

3. A club having a head, and a flange upon said head consisting of at least one layer of plastic material and at least one layer of open-mesh woven fabric embedded therein.

4. A club having a head, and a flange upon said head consisting of a plurality of layers of celluloid and at least one layer of fabric, the latter intervening between the celluloid layers.

5. A club having a head, and a flange upon said head consisting of a plurality of pieces of celluloid and a plurality of pieces of fabric, the latter alternating with the celluloid and being embedded therein.

6. A club having a head, and a flange upon said head consisting of a plurality of pieces of celluloid and a plurality of alternating pieces of fabric; the inner and outer layers of said flange consisting of celluloid.

7. A club having a head, and a flange upon said head consisting of three layers of celluloid and two layers of fabric embedded therein and alternating therewith, the outer and inner layers of said flange consisting of celluloid.

8. A club having a head, and a flange upon said head consisting of open-mesh fabric embedded in celluloid.

9. A club having a head, and a flange dovetailed into said head and consisting of celluloid in which fabric is embedded.

699,625. MOLD FOR CONCRETE STRUCTURES. CHARLES F. LAMBERT, Potomac, Md., assignor of one-half to Fred S. Davis, Potomac, Md. Filed Nov. 14, 1901. Serial No. 20,272. (No model.)

Claim.—1. In a mold for concrete work, the combination with the side plates, a cross-bar and posts or standards secured to the side plates one directly connected at its upper end to the cross-bar and the other pivotally connected to said cross-bar, of means for moving one side plate toward and away from the other, said means comprising a lever pivoted

to the cross-bar and a link connected to the movable side piece, substantially as set forth.

2. In a mold for concrete work, the combination with an inner set of side pieces and an outer set of side pieces, posts or standards secured to said sets of side pieces, cross-bars to which the upper ends of the posts of one set of side pieces are fixed and the upper ends of the posts of the other set of side pieces are pivoted, of levers pivoted to said cross-bars and links pivoted to said levers and to the movable sets of side pieces, substantially as set forth.

3. In a mold for concrete work, the combination with an inner set of side pieces and an outer set of side pieces, posts or standards secured to said sets of side pieces, cross-bars to which the upper ends of the posts of one set of side pieces are fixed and the upper ends of the posts of the other set of side pieces are pivoted, of levers pivoted to said cross-bars, links pivoted to said levers and to the movable sets of side pieces, and a handle connecting said levers, substantially as set forth.

699,626. NON-REFILLABLE BOTTLE. JAMES R. LATHAM, New York, N. Y., assignor of one-half to Robert M. Hunt, New York, N. Y. Filed May 10, 1902. Serial No. 14,129. (No model.)

Claim.—1. The combination with the neck of a bottle provided with a passage-way for opening communication between the interior of the neck and the interior of the body of the bottle, of a float-valve for closing said passage-way, guides for directing the float-valve to its seat, a pivoted weight for holding the valve closed under the influence of gravity and a pivoted gravity-catch for locking the weight in position to close the valve, substantially as set forth.

2. The combination with the neck of a bottle provided with a passage-way opening communication between the interior of the neck and interior of the body of the bottle, of a float-valve, guides for directing the float-valve toward and away from its seat to close the above-mentioned passage-way, a weight for holding the valve closed under the influence of gravity, the said weight being pivoted to swing vertically, a horizontally-acting piece forming a support for the vertically-acting weight and a swinging gravity-catch for locking the weight, substantially as set forth.

3. The combination with the neck of a bottle provided with a passage-way for opening communication between the interior of the neck and the interior of the body of the bottle and means for automatically closing said passage-way, of a guard located between said closing means and the neck of the bottle, the said guard comprising a perforated support and a glass plate loosely held on said perforated support, substantially as set forth.

699,627. GUANO-DISTRIBUTER. ROBERT H. NIXON, Columbus, Ga., assignor to Felt & Harris, Columbus, Ga. Filed Mar. 6, 1902. Serial No. 24,962. (No model.)

Claim.—1. A vibrating guano-distributor, comprising in combination with the beam, handles coated in recesses in the opposite faces of the beam and secured therein, angle-bars fastened to said handles, a hopper pivotally mounted on said bars, a wheel journaled in suitable bearings on said beam, a disk on the face of said wheel and provided with laterally-projecting pins, a pivoted arm, carried by said beam and disposed in the path of said pins, pivoted link-and-lever connections between said arm and the hopper, as set forth.

2. A vibrating guano-distributor, comprising, in combination with the beam, the wheel carried thereby, the disk rotating with said wheel laterally-projecting pins on said disk, a standard on the beam, an arm pivoted to said standard, and having its free end disposed in the path of said pins, handles coated in inclined recesses in the opposite faces of said beam, angle-bars, fastened to said handles, a hopper pivotally mounted on said bars, a cross-piece fastened to the lower rear edge of said hopper, the ends of which cross-piece are adapted to strike against the forward edges of the upright inclined portions of said angle-bars, to limit the rearward throw of the hopper, a lever pivoted to the hopper, means for holding the lever in different positions, a bar pivotally connecting said

lever with said pivotal arm, and the pivotal point mounted on the rear end of the beam, as set forth.

699,628. METHOD FOR POLISHING PARTS OF BOOTS OR SHOES. JOHN R. HORN, Lynn, Mass. Filed Jan. 17, 1902. Serial No. 1,708. (No model.)

Claim.—A medium for polishing the worn surfaces of boots and shoes comprising a carrier arranged for movement relatively, flangeless members projecting tangentially from the periphery of the carrier, and a flexible covering over the outer ends of said members.

699,629. KNEADING-BOARD. LORENZO D. FAYNE, Mansfield, Ohio. Filed Sept. 21, 1901. Serial No. 78,078. (No model.)

Claim.—1. As an improved article of manufacture, a kneading-board consisting of a body or filling having heated upon the bottom or under side thereof, a metal bottom provided with a right-angled portion formed of a width to correspond with the thickness of the body or filling, and an extension formed integral with the bottom, a metal top located over the body or filling and over the extension, and said top folded at its sides and ends, substantially as and for the purpose specified.

2. As an improved article of manufacture, a kneading-board consisting of a body or filling, a metal bottom provided with a metal extension, a metal top secured to the body and metal bottom and to the forward extension, and said forward extension and metal top located upon

mid metal extension formed into a U-shape molding, said U-shaped molding extended above the top of the board, and the forward edge thereof extended below the bottom of the board, and located away from the end of the body, substantially as and for the purpose specified.

699,630. METHOD OF RECORDING MESSAGE SIGNALS. DR. PETER O. PEDERSEN, Copenhagen, Denmark, assignor, by mesne assignments, to the American Telegraph and Telephone Company, a Corporation of New Jersey. Filed Mar. 2, 1902. Serial No. 8,017. (No model.)

Claim.—1. The method of storing a plurality of messages or signals for subsequent reproduction, which consists in establishing in a paramagnetic body a series of magnetic conditions corresponding to a message or signal and then superposing or establishing another series of magnetic conditions in said paramagnetic body within the range of the first series of magnetic conditions and corresponding to a second message or signal and so on superposing series of magnetic conditions corresponding to respective messages or signals.

2. The method of storing a plurality of messages or signals for subsequent reproduction, which consists in establishing in a paramagnetic body two series of magnetic conditions similar in all respects to each other and corresponding to one message or signal and then superposing or establishing two other series of magnetic conditions in said paramagnetic body within the range of the first-mentioned two series, the second two series being similar to each other in every respect and corresponding to a second message or signal, and so on superposing or establishing two corresponding series of magnetic conditions for each message all within the same range on the paramagnetic body, substantially as described.

3. The method of storing a plurality of messages or signals for subsequent reproduction which consists in establishing in a paramagnetic body two series of magnetic conditions similar in all respects to each other and corresponding to the message or signal, then superposing or establishing two other series of magnetic conditions in said paramagnetic body similar in all respects to each other but differing in relation to each other from the relation existing between the two series first mentioned, said second two series being established in the said paramagnetic body within the range of the two series first mentioned and so on superposing or establishing two corresponding series of magnetic conditions for each message all within the same range on the paramagnetic body and the relation between each two series differing from that between every other two, substantially as described.

4. The method of storing a plurality of messages or signals for subsequent reproduction which consists in simultaneously causing a plurality of electromagnets to establish like magnetic conditions at a plurality of different locations on a moving magnetic body, said magnetic conditions corresponding to and being produced by one message, then altering the relation of the electromagnets and again causing them to establish like magnetic conditions at a plurality of different locations on said moving body, said magnetic conditions corresponding to and being produced by a second message, and so on, for each message altering the relation between the magnets and then establishing the magnetic conditions therein, substantially as described.

5. The method of storing a plurality of messages or signals and subsequently reproducing the same which consists in establishing in a paramagnetic body a series of magnetic conditions corresponding to a message or signal and then superposing or establishing another series of magnetic conditions in said paramagnetic body within the range of the first series and corresponding to a second message or signal and so on superposing different series of magnetic conditions corresponding to respective messages or signals, and then causing any one of said respective series of magnetic conditions to influence a receiving apparatus sensitive thereon.

6. The method of storing a plurality of messages or signals and subsequently reproducing the same, consisting in establishing in a paramagnetic body two series of magnetic conditions similar in all respects to each other and corresponding to one message or signal and then superposing or establishing two other series of magnetic conditions in said paramagnetic body within the range of the first-mentioned two series, the second two series being similar to each other in every respect and corresponding to a second message or signal, and so on superposing or establishing two corresponding series of magnetic conditions for each message all within the same range on the paramagnetic body and then causing any one of said pairs of series of magnetic conditions to influence a receiving apparatus sensitive thereon.

699,631. RUNNING-GEAR FOR VEHICLES. EDWARD J. FRIEDBERG, London, England. Filed June 10, 1901. Serial No. 64,698. (No model.)

Claim.—In a vehicle, the combination of a fixed wheeled axle at one end thereof; an axle at the opposite end of the vehicle carrying steering knuckles and wheels adapted to be shifted in position in steering; a block or support attached centrally to the fixed axle; a pulley mounted in said block or support, and a flexible connection having one end secured to an arm on the steering-knuckle of the running-gear adapted to be shifted in position in steering, then passing around said pulley and having its opposite end fastened to the other and coincidentally-operated steering-knuckle of said running-gear, substantially as set forth.

699,632. MANUFACTURE OF GOLF-BALLS OR OTHER ARTICLES. FRANK E. REINHARDT, Hartford, Conn., assignor to The Knapshall Manufacturing Company, a Corporation of New Jersey. Filed Feb. 14, 1902. Serial No. 98,312. (No specimens.)

Claim.—1. A process in producing playing-balls, consisting in molding a core within a shell of plastic material and causing said shell to harden.

2. A process in producing playing-balls, consisting in molding a springy core within a shell of celluloid.

3. A process in producing playing-balls, consisting in molding a gutta-percha core within a shell of celluloid.

4. A process in molding playing-balls, consisting in placing a shell of plastic material within the mold, forcing heated material into the shell so as to cause the latter to conform to the mold, and causing the shell and core to harden.

5. A process in molding playing-balls, consisting in placing a celluloid shell within plastic within a figured mold, forcing a fluent mass into the shell so as to cause the shell to expand and become embraced by the mold, and causing the shell and core to harden while confined in the mold.

6. A process in molding playing-balls, consisting in placing an undischarged celluloid shell within a mold and causing the same and cause it to fit the mold, and hardening the shell while in the mold.

7. A process in molding playing-balls, consisting in placing within a figured mold a shell consisting partially or wholly of celluloid, causing the mold tightly, forcing gutta-percha, forcing the gutta-percha into said shell so as to cause the same to fit the mold, and causing the celluloid to harden while the mold remains closed.

8. A process in molding an article of celluloid, consisting in forcing a blank undischarged but approximately conforming to the shape of the mold, inserting the blank within the mold, heating the blank, and expanding the blank by internal pressure so as to fit the mold.

9. A process in molding an article of celluloid, consisting in forcing the article undischarged but approximately conforming to the shape of the mold, inserting the blank within the mold, heating the mold, expanding the blank by internal pressure so as to fit the mold, and causing said article to harden while confined in the mold.

10. A process in molding an article of celluloid, consisting in forcing the article undischarged but approximately conforming to the shape of the mold, inserting the blank within the mold, heating the mold, expanding the blank by internal pressure so as to fit the mold, causing said article to

harder while confined in the mold, and maintaining such internal pressure until the article hardens.

11. A process in producing playing-balls, consisting in reducing hard material to fluent condition, forcing it into a hollow sphere of plastic material so as to cause the latter to conform to a mold, causing the sphere and the filling to harden, and plugging up the hole through which the fluent mass is introduced.

12. A process in producing playing-balls, consisting in forcing into a shell consisting partially or wholly of malleable material a heated mass of gutta-percha too great for the capacity of said shell, so as to expand the latter, and causing the gutta-percha to harden and form a permanent core.

13. A process in producing playing-balls, consisting in forcing a hollow malleable sphere with a vent, inserting a funnel into said sphere, heating said sphere, heating gutta-percha, causing said gutta-percha to flow through said funnel and force out the air through said vent, subjecting the gutta-percha to pressure so as to distend said sphere, preventing escape of gutta-percha through said vent during the application of pressure, allowing the gutta-percha and the shell to harden under pressure, withdrawing the funnel, and plugging the shell.

14. A process in producing playing-balls, consisting in introducing a fluent mass into a hollow sphere of plastic material, permitting the air to escape from said hollow sphere, closing the air-vent, forcing more fluent mass into the sphere so as to expand the latter, and causing said sphere and filling to harden.

15. A process in producing playing-balls, consisting in introducing heated gutta-percha into a heated hollow sphere consisting partially or wholly of malleable material, permitting the air to escape from said hollow sphere at a point near the point of introduction of said gutta-percha, closing the air-vent, forcing more gutta-percha into the sphere so as to distend the latter, and causing said sphere and said gutta-percha to harden.

16. A process in producing playing-balls, consisting in forcing a seamless shell of plastic material, molding a core within said shell, and causing the shell to harden.

17. A process in producing playing-balls, consisting in reducing hard, springy material to a fluent condition, introducing it within a seamless shell of malleable material, and causing the core to harden.

18. A process in producing playing-balls, consisting in heating gutta-percha, introducing it into a seamless shell of malleable material, and causing the gutta-percha to harden under pressure.

19. A process in molding playing-balls, consisting in placing a seamless malleable shell within the mold, forcing heated material through a hole formed in the shell so as to cause the latter to conform to the mold, and causing the shell and core to harden.

20. A process in molding playing-balls, consisting in placing a fluent mass into the shell so as to cause the latter to conform to the mold, and causing the shell and core to harden while confined in the mold.

21. A process in molding playing-balls, consisting in placing an undistended seamless malleable shell within a figured mold, forcing heated gutta-percha into the shell so as to expand the same to fit the mold, and hardening the shell while in the mold.

22. A process in producing playing-balls, consisting in introducing core material under pressure within a shell of plastic material, and causing said shell and core to harden gradually from the exterior while the pressure is continued.

23. A process in producing playing-balls, consisting in compressing a springy core within an entire shell consisting partially or wholly of malleable material.

24. A process in producing playing-balls, consisting in compressing gutta-percha within a shell of malleable material by forcing into said shell extra gutta-percha while in a fluent condition, and causing it to harden while under pressure.

25. A process in molding playing-balls, consisting in placing a malleable shell within the mold, forcing heated material into the shell so as to cause the shell to conform to the mold, forcing extra material into said shell so as to compress the shell and compress the core, and causing the shell and core to harden while the pressure is continued.

26. A process in molding figured playing-balls, consisting in placing an entire malleable malleable shell within a figured mold, forcing a fluent mass into the shell so as to cause the same to conform to the mold, and causing the shell and core to harden while confined in the mold.

27. A process in molding playing-balls, consisting in placing an undistended malleable shell within a mold and causing the mold, forcing heated gutta-percha into the shell so as to expand the same to fit the mold, and forcing extra gutta-percha into the shell so the shell and core gradually harden.

28. A process in molding playing-balls, consisting in placing within a mold a shell consisting partially or wholly of malleable material, closing the mold tightly, heating gutta-percha, forcing the gutta-percha into said shell so as to cause the same to fit the mold, causing the shell and core to harden

gradually while the mold remains closed, and forcing an extra quantity of gutta-percha into the shell during said hardening.

29. A process in producing playing-balls, consisting in reducing hard material to fluent condition, forcing it into a seamless hollow sphere of malleable material so as to cause the latter to conform to a mold, forcing extra fluent material into the sphere, causing the sphere and the filling to harden, and plugging up the hole through which the fluent mass was introduced.

30. A process in producing playing-balls, consisting in forcing into a seamless shell consisting partially or wholly of malleable material a heated mass of gutta-percha too great for the capacity of said shell, so as to expand the latter, and causing the shell and gutta-percha to harden while confined in the mold.

31. A process in producing playing-balls, consisting in forcing a seamless hollow malleable sphere with a vent, inserting a funnel into said sphere, heating said sphere, heating gutta-percha, causing said gutta-percha to flow through said funnel and force out the air through said vent, subjecting the gutta-percha to pressure so as to distend said sphere, preventing escape of gutta-percha through said vent during the application of pressure, allowing the gutta-percha and the shell to harden under pressure, withdrawing the funnel, and plugging the shell.

32. A process in producing playing-balls, consisting in introducing a fluent mass into a hollow sphere of plastic material, permitting the air to escape from said hollow sphere, closing the air-vent, forcing more fluent mass into the sphere so as to expand the latter, and causing said sphere and filling to harden gradually from the exterior while extra material is forced into the shell.

33. A process in producing playing-balls, consisting in introducing heated gutta-percha into a heated seamless hollow sphere consisting partially or wholly of malleable material, permitting the air to escape from said hollow sphere at a point near the point of introduction of said gutta-percha, closing the air-vent, forcing more gutta-percha into the sphere so as to distend the latter, and causing said sphere and said gutta-percha to harden, while extra gutta-percha in a fluent condition is forced therein.

699,683. ELECTRIC CUT-OFF SWITCH. LAWRENCE W. RICHMOND, Durham, Tenn., assignor of one-half to VERNON E. LOCKWOOD, Lawrence County, Tenn. Filed Oct. 10, 1901. Serial No. 71,169. (No model.)

Claim.—1. In combination with the insulating tubes and supporting means therefor, a metallic plug secured within each tube, a threaded wire passing through each plug, a movable guide-plate and a threaded wire passing through each guide-plate and mounted within the tubes, insulating plugs at the ends of said tubes and through which plugs said wires pass, a switch-lever, and insulated connections between said lever and the wires passing through the guide-plates, as set forth.

2. In combination with the glass tubes, the frame supporting the same, the metallic plugs, one secured in the corresponding end of each tube, each plug being centrally apertured and threaded, the inner end of the plugs being chamfered out in conical shape, a headed wire coated in said chamfered portion, with the wire passing through the threaded aperture therein, the guide-plates, one in each tube and centrally apertured, a threaded wire passing through the apertured portion of each guide-plate, a switch-lever, and segment to which it is pivoted, a dog engaging a recess in said segment, an insulating-bar connecting the eyes at the outer ends of the threaded wires engaging said guide-plates, and a connection between the switch-lever and the insulating-bar, substantially as shown and described.

3. In combination with the bracket-arm, the yokes secured therein, the frame secured to said yokes, the glass tubes supported in recessed portions of said yokes, the metallic plugs chambered as described and seated in the ends of said tubes, the threaded wires passing through threaded apertures in said plugs, the movable guide-plates in the tubes, the threaded wires passing through threaded apertures in said movable guide-plates and

having eyes at their outer ends, the switch-lever, the insulating-bar mounted on the eyes of said wires, the insulating-strip connecting the switch-lever with said insulating-bar and the insulating washers and spacers as said bar, as shown and described.

699,684. CAR-GRAT CLEANER. JOHN A. EMM, San Antonio, Tex. Filed Feb. 14, 1901. Serial No. 47,399. (No model.)

Claim.—1. A machine for cleaning car-grats, comprising a continuous flexible, telescopic, movable support having means for moving it and adapted to receive and support the car-grats throughout the width of the latter, and a beater constructed and arranged to strike the support at the opposite side from the car-grats, whereby the force of the blow is distributed over the face of the car-grats.

2. A machine for cleaning car-grats comprising a laterally-extensible carrying-belt adapted to receive and support the car-grats throughout the width of the latter, and a beater constructed and arranged to strike the belt at the opposite side from the car-grats, whereby the force of the blow is distributed laterally over the car-grats.

3. A machine-cleaning machine comprising a carrying-belt adapted to receive and support an article to be treated throughout the width of the latter, and a beater operably connected with the belt-carrying means, and disposed to strike the belt and force it against the article undergoing treatment.

4. A machine of the class described comprising a telescopic belt having supporting-rollers one of which has terminal pins, and a beater pivoted with one end in the path of movement of the pins and having the opposite end thereof disposed to strike against the under side of the belt and force it against the article undergoing treatment.

5. A machine for cleaning car-grats comprising a telescopic, laterally-extensible belt having supporting-rollers and adapted to receive and support car-grats throughout the width of the latter, a strikeer operably connected with one of the rollers and disposed to strike the belt at the opposite side from the car-grats, and brushes disposed beyond the belt to receive the car-grats from the latter and having means for operating them.

6. A machine of the class described comprising a telescopic belt having supporting-rollers and disposed to receive an article to be cleaned, a beater disposed to strike the belt beneath the said article and force it thereagainst, brushes adapted to receive from the belt, supporting-rollers adjacent the brushes for maintaining the article in operative relation to the brushes, a tank in which the brushes dip to take a cleaning fluid therefrom, a drive-shaft, and connections between the drive-shaft, the belt-supporting means and the brushes for operating the apparatus.

699,685. GRABATOR FOR REFUSE. ROBERT R. ROBINSON, Portland, Ore., assignor to Robert R. Robinson, Herbert R. Robinson, and Harsho R. Robinson, Portland, Ore. Filed May 20, 1902. Serial No. 711,364. (No model.)

Claim.—1. The combination in a conveyor of a lower or primary fire-box and burning-chamber, an upper or main burning-chamber extending over the primary fire-box and burning-chamber, a portion of the base of the upper or main chamber over the primary fire-box being a fire floor or table, and the remainder an open grating, a second independent fire-box, a communicating passage-way or flue between the said primary and main burning-chambers, passing under and around each second fire-box, a drying and burning table as G located over the second fire-box, and a branch flue extending around and over said table which branch flue is controlled by

over the primary fire-box and burning-chamber, a portion of the base of the upper or main chamber over the primary fire-box being a fire floor or table, and the remainder an open grating, a second independent fire-box, a communicating passage-way or flue between the said primary and main burning-chambers, passing under and around each second fire-box, a drying and burning table as G located over the second fire-box, and a branch flue extending around and over said table which branch flue is controlled by the main burning-chamber communicating with the smoke-stack, substantially as set forth.

2. The combination in a conveyor of a lower or primary fire-box and burning-chamber, an upper or main burning-chamber extending over the primary fire-box and burning-chamber, a portion of the base of the upper or main chamber over the primary fire-box being a fire floor or table and the remainder an open grating, a second independent fire-box, a communicating passage-way or flue between the said primary and main burning-chambers, passing under and around each second fire-box, a drying and burning table as G located over the second fire-box, and a branch flue extending around and over said table which branch flue is controlled by a damper whereby such branch flue may be closed, the main burning-chamber communicating with the smoke-stack, there being suitable charge-holes in the roof of each burning-chamber, and over the burning-table, through which to throw refuse, substantially as set forth.

3. The combination in a conveyor of a lower or primary fire-box and burning-chamber, an upper or main burning-chamber extending over the primary fire-box and burning-chamber, a portion of the base of the upper or main chamber over the primary fire-box being a fire floor or table and the remainder an open grating, a second independent fire-box, a communicating passage-way or flue between the said primary and main burning-chambers, passing under and around each second fire-box, a drying and burning table as G located over the second fire-box, and a branch flue extending around and over said table, which branch flue is controlled by a damper whereby such branch flue may be closed, the main burning-chamber communicating with the smoke-stack, a series of doors in the working side of the primary burning-chamber for the removal of ashes, and a grating elevated platform, as B, extending beneath, outside of, said doors, there being suitable charge-holes in the roof of each burning-chamber, and over the burning-table, through which to throw refuse, a series of pipes or ducts as 11, the outer ends of which extend beneath said elevated platform and are connected with means causing an air-current through said pipes, for removing the ashes and dust contained by pulling the ashes and unburned refuse out of the primary burning-chamber onto said platform, substantially as set forth.

4. The combination in a conveyor of a lower or primary fire-box and burning-chamber, an upper or main burning-chamber extending over the primary fire-box and burning-chamber, a portion of the base of the upper or main chamber over the primary fire-box being a fire floor or table and the remainder an open grating, a second independent fire-box, a communicating passage-way or flue between the said primary and main burning-chambers, passing under and around each second fire-box, a drying and burning table as G located over the second fire-box, and a branch flue extending around and over said table, which branch flue is controlled by a damper whereby such branch flue may be closed, the main burning-chamber communicating with the smoke-stack, a series of doors in the working side of the primary burning-chamber for the removal of ashes, and a grating elevated platform, as B, extending beneath, outside of, said doors, there being suitable charge-holes in the roof of each burning-chamber, and over the burning-table, through which to throw refuse, a series of pipes or ducts as 11, the outer ends of which extend beneath said elevated platform and are connected with means causing an air-current through said pipes, for removing the ashes and dust contained by pulling the ashes and unburned refuse out of the primary burning-chamber onto said platform, substantially as set forth.

5. The combination in a conveyor of a lower or primary fire-box and burning-chamber, an upper or main burning-chamber extending over the primary fire-box and burning-chamber, a portion of the base of the upper or main chamber over the primary fire-box being a fire floor or table and the remainder an open grating, a second independent fire-box, a communicating passage-way or flue between the said primary and main burning-chambers, passing under and around each second fire-box, a drying and burning table as G located over the second fire-box, and a branch flue extending around and over said table which branch flue is controlled by a damper whereby such branch flue may be closed, a third independent fire-box, as 12, connected by a passage-way with the main burning-chamber and the smoke-stack, there being suitable charge-holes in the roof of each burning-chamber and over the burning-table G through which to throw the refuse, substantially as set forth.

6. The combination in a conveyor of a lower or primary fire-box and burning-chamber, an upper or main burning-chamber extending over the primary fire-box and burning-chamber, a portion of the base of the upper or main chamber over the primary fire-box being a fire floor or table and the remainder an open grating, a second independent fire-box, a communicating passage-way or flue between the said primary and main burning-chambers, passing under and around each second fire-box, a drying and burning table as G located over the second fire-box, and a branch flue extending around and over said table which branch flue is controlled by

a damper whereby each branch flue may be closed, a third independent fire-box, as 18, connected by a passage-way with the main burning-chamber, said third fire-box comprising two contiguous independent compartments connected with each by an intermediate passage-way, one being a coking-chamber, having a closed floor and the other being a burning-chamber with grating floor, and there being a checker-arch within the said burning-chamber, an expansion-chamber 25, connected by passage-ways with the said third fire-box 18, and having a suitable damper-controlled heat-escape, a drying and burning chamber 27 located above said expansion-chamber 25, having a closed floor and connected by passage-ways with the said burning-chamber 2, there being suitable charge-holes for throwing the refuse into the crucible, substantially as described.

7. The combination is a crucible of a lower or primary fire-box and burning-chamber, an upper or main burning-chamber extending over the primary fire-box and burning-chamber, a portion of the base of the upper or main chamber over the primary fire-box being a tile flooring or table, and the remainder an open grating, a second independent fire-box, a communicating passage-way or flue between the said primary and main burning-chambers, passing under and around each second fire-box, a drying and burning table as 6 located over the second fire-box, and a branch flue extending around and over said table, which branch flue is controlled by a damper whereby each branch flue may be closed, a third independent fire-box as 18 connected by a passage-way with the main burning-chamber, said third fire-box comprising two contiguous independent compartments connected with each by an intermediate passage-way one being a coking-chamber, having a closed floor and the other being a burning-chamber with grating floor, and there being a checker-arch within the said burning-chamber, an expansion-chamber 25, connected by passage-ways with the said third fire-box 18 and communicating with chamber as 21, provided with a tank for receiving, and in which to evaporate water drained from the receiving and dumping tanks, said chamber 21 having a suitable damper-controlled heat-escape, a drying and burning chamber 27 located above said expansion-chamber 25 having a closed floor and connected by passage-ways with the main burning-chamber 2, there being suitable charge-holes for throwing the refuse into the crucible, each of said charge-holes being provided with a suitable receiving or dumping tank adapted to discharge its contents through such charge-holes and to drain its contents into a catch-basin, for such purpose provided, the catch-basin having a pipe for conveying the water collected into the evaporating-tank, substantially as described.

8. The combination is a crucible of a lower or primary fire-box and burning-chamber, an upper or main burning-chamber extending over the primary fire-box and burning-chamber, a portion of the base of the upper or main chamber over the primary fire-box being a tile flooring or table, and the remainder an open grating, a second independent fire-box, a communicating passage-way or flue between the said primary and main burning-chambers, passing under and around each second fire-box, a drying and burning table, as 6, located over the second fire-box, and a branch flue extending around and over said table which branch flue is controlled by a damper whereby each branch flue may be closed, a third independent fire-box, as 18 connected by a passage-way with the main burning-chamber, said third fire-box comprising two contiguous independent compartments connected with each by an intermediate passage-way one being a coking-chamber, having a closed floor and the other being a burning-chamber with grating floor, and there being a checker-arch within the said burning-chamber, an expansion-chamber 25, connected by passage-ways with the said third fire-box 18 and communicating with chamber as 21, provided with a tank for receiving, and in which to evaporate water drained from the receiving and dumping tanks, said chamber 21 having a suitable damper-controlled heat-escape, a drying and burning chamber 27 located above said expansion-chamber 25 having a closed floor and connected by passage-ways with the main burning-chamber 2, there being suitable charge-holes for throwing the refuse into the crucible, each of said charge-holes being provided with a suitable receiving or dumping tank adapted to discharge its contents through such charge-holes and to drain its contents into a catch-basin, for such purpose provided, the catch-basins having pipes as 23, 23' for conveying the water collected into the evaporating-tank, and means for producing an air-current through said catch-basins and drain-pipes 23 23' for removal of the offensive gases and conveyance of the same into a burning-chamber to be there consumed, substantially as described.

9. The combination is a refuse-burner in which each hopper rests, and the cover for the hopper, of means for lifting each hopper at an end and simultaneously therewith its cover, substantially as described.

10. In a crucible, or furnace, the combination of the combustion-chamber, a superimposed heating-chamber, and an intermediate, or dividing table or floor consisting of bearing courses, leading courses intersecting the former, and lipped flues covering the openings between such intersecting courses, substantially as described.

699,686. TURNER. ROBERT C. TURNER, Wallen-upton-Thames, England. Filed Jan. 11, 1902. Serial No. 90,216. (No model.)

Claim.—1. A turbine comprising a shaft, a number of flat circular disks spaced apart on the shaft and means for forcing a liquid in a straight line between the disks, whereby said disks and shaft are caused to revolve by the friction of the liquid on the sides of the disks, substantially as described.

2. A turbine having a casing, a shaft carrying flat disks spaced apart, means for passing a fluid through the spaces thus formed to rotate the disks by friction, and an inlet and an outlet both in the circumference of the casing, as described.

3. A turbine having a shaft carrying flat disks, spaced apart, an inlet for the motive fluid to rotate the disks by friction and an outlet in line with said inlet and tangential to the disks, substantially as described.

4. A turbine comprising a shaft carrying disks with chamber spaces between them in combination with an inclosing casing provided with a fluid-inlet and an opposite outlet, in line with the inlet, whereby the fluid passes in contact with the disks in a straight line through the chamber spaces between the disks to the outlet, substantially as described.

5. A turbine comprising a number of shafts, disks on said shafts, said disks being spaced apart, a casing for the shafts and disks and an inlet and an outlet in the casing placed in a line with each other and crossing the disks of more than one shaft, substantially as and for the purpose described.

REISSUES.

11,989. CARTER. ALBERT R. CARTER, Brooklyn, N. Y. Filed Dec. 12, 1901. Serial No. 95,928. Original No. 694,966, dated July 31, 1900.

Claim.—1. The combination with the center-wheel, jaws and pliate, of a disk surrounding the pliate and upon which the tubular leg rests, a spring-frame spanning the pliate, fitting within the tubular leg and acting frictionally against the inner surface of the tubular leg to hold the center in place and prevent the same accidentally dropping out, and means for limiting the compressive movement of the free portion of said frame, substantially as set forth.

2. The combination with the center-wheel, jaws and pliate, of a disk surrounding the pliate and upon which the tubular leg rests, a spring-frame spanning the pliate and having a hole at its folded portion to receive the pliate near its free end, said frame fitting within the tubular leg and acting frictionally against the inner surface thereof to hold the center in place and prevent the same accidentally dropping out, and means for limiting the compressive movement of the free portion of said frame, substantially as set forth.

3. The combination with the center-wheel, jaws and pliate, of a disk surrounding the pliate and upon which the tubular leg rests, a spring-frame spanning the pliate fitting within the tubular leg and acting frictionally against the inner surface of the tubular leg to hold the center in place and prevent the same accidentally dropping out, means for limiting the compressive movement of the free portion of said frame, and means for limiting the central position of the pliate, substantially as set forth.

4. The combination with the center-wheel, jaws and pliate, of a disk

surrounding the pliate and upon which the tubular leg rests, a spring-frame spanning the pliate and having a hole at its folded portion to receive the pliate near its free end, said frame fitting within the tubular leg and acting frictionally against the inner surface thereof to hold the center in place and prevent the same accidentally dropping out, means for limiting the central position of the pliate and means for limiting the compressive movement of the free portion of said frame, substantially as set forth.

5. The combination with the center-wheel, jaws and pliate, a disk surrounding the pliate and upon which the tubular leg rests, and a spring-frame spanning the pliate within the tubular leg and acting outwardly against the inner surface of the tubular leg to maintain the center frictionally in position, of means for limiting the central position of the pliate and means acting in connection therewith and with the spring-frame for limiting the movement of the spring-frame, substantially as set forth.

6. The combination with the center-wheel, jaws and pliate, a disk surrounding the pliate and upon which the tubular leg rests, and a spring-frame spanning the pliate within the tubular leg and acting outwardly against the inner surface of the tubular leg to maintain the center frictionally in position, of a guide-plate surrounding the pliate above the said disk and adapted to pass into the lower end of the tubular leg, said plate having perforations at opposite sides of the pliate and tapers upon the free ends of the spring-frame passing into the perforations of the said plate, substantially as set forth.

7. The combination with the center-wheel, jaws and pliate and a disk surrounding the pliate and upon which the tubular leg rests, of an inverted-U-shaped spring-frame spanning the pliate within the tubular leg and having a central portion through which the pliate passes and the vertical edges of the frame bent outward as wings and which frame acts outwardly against the inner surface of the tubular leg to maintain the center frictionally in position, means for limiting the central position of the pliate and means acting in connection therewith and with the spring-frame for limiting the movement of the spring-frame, substantially as set forth.

11,988. RAILWAY SIGNALING AND SWITCHING APPARATUS. JOHN D. TAYLOR, Buffalo, N. Y., assignor to Taylor Signal Company, a Corporation of New York. Filed May 30, 1901. Serial No. 95,929. Original No. 694,967, dated June 7, 1900.

Claim.—1. In a railway signaling and switching apparatus, a series of operating-levers, primary and secondary locking-bars, connections between the primary bars and levers, yielding connections between the primary and secondary bars, holding-latches for the secondary bars, and electrical means for releasing the latches, substantially as and for the purposes set forth.

2. In a railway signaling and switching apparatus, a series of operating-levers, primary and secondary locking-bars arranged in pairs, one

upon the other, connections between the primary bars and levers, spring-yielding connections between the pairs of bars, and electrically-actuated locking devices for the secondary bars, substantially as specified.

3. In a railway switching apparatus, a series of operating-levers, primary and secondary locking-bars, arranged in pairs, one upon the other, link connections between the primary bars and levers, spring-yielding connections between the primary and secondary bars, two latches for controlling the opposite movements of each secondary bar, spring-pressed pawls, one at each end of each primary bar, adapted to engage notches in the primary bars, and hold said primary bars until released by the secondary bars, and electromagnetic means for lifting the latches and releasing the secondary bars, substantially as specified.

4. A railway switching mechanism, comprising operating-levers, primary and secondary locking-bars, link connections between the primary bars and levers, spring-yielding connections between the primary and secondary bars, holding-latches for the secondary bars, electromagnets for raising the latches, and a switch-operating motor, by means of which the magnets are energized at the proper time by currents generated by the rotation of the switch-motor mechanism, substantially as specified.

5. In a railway-switch-operating mechanism, a series of operating-levers, electric-circuit-carrying levers, primary and secondary locking-bars, link connections between the primary bars and levers, spring-yielding connections between the primary and secondary bars, holding-latches for the secondary bars, spring-pressed pawls for holding the primary bars until the secondary bars have made complete movement, electromagnets for lifting the latches and electric circuits comprising the switch-operating motor, an automatic electric reversing-switch operated by the motor, the circuit-carrying levers attached to the operating-levers, the electromagnets and electrical connections, substantially as specified.

6. In a railway signaling apparatus, a signal, a motor for reversing the same, a counterbalanced lever for restoring the signal to its normal position, and rotating the motor in the reverse direction, a signal-operating lever, a two-position circuit-carrying lever, a primary locking-bar, a secondary locking-bar, a link connection between the primary bar and lever, a spring-yielding connection between the two bars, a latch for controlling the movement of the secondary bar, and an electromagnet for raising said latch, the said magnet being in a circuit leading from the motor and energized by the current generated by the reverse rotation of the motor, substantially as specified.

7. In a railway signaling apparatus, two electromagnets or signals, a motor, chevron levers mounted on the shaft of the motor, a clutch mechanism, between said shaft and the chevrons, the said clutch mechanism operating to rotate the chevrons in opposite directions when the motor is reversed, and connections between said chevrons and electromagnets or signals, substantially as specified.

8. A railway-signal, comprising two swinging signals, a motor for operating the same, two chevrons loosely mounted on the shaft of the motor, a single-tooth ratchet-wheel, arranged at one side of each chevron, pawls carried by the chevrons for engaging the said teeth, counterbalanced levers on the support for the signals, connections between the chevrons and levers, and connections between the levers and signals, substantially as specified.

9. In a railway-signal-operating mechanism, two electromagnets or signals, a reversal electric motor for operating the signals, a clutch mechanism on the shaft of the motor for selecting either one or the other signal, depending on the direction of rotation of the motor, a polarized pole-changing relay for determining the direction of the current through the motor-circuit, a two-position circuit-carrying lever, attached to each of the two signal-operating levers, one for each signal, said circuit-carrying levers acting conjointly to control the circuit through the polarized relay and severally to control circuits through the motor, a generator and the electrical connections, substantially as specified.

DESIGNS.

85,890. BUTTON. BRADLEY T. HARRIS, St. Louis, Mo. Filed Apr. 1, 1902. Serial No. 100,065. Term of patent 14 years.

Claim.—The design for a button, substantially as herein shown and described.

85,891. RACK FOR BRUSHES, BROOMS, OR SIMILAR ARTICLES. HENRY A. KRAMER, New York, N. Y., assignor to Long & Koch, Newark, N. J., a Corporation of New Jersey. Filed Mar. 12, 1902. Serial No. 97,864. Term of patent 14 years.

Claim.—The design for a rack for brushes, brooms or similar articles, substantially as herein shown and described.

85,892. GLASS DISK. WILLIAM S. CLARK, St. Louis, Mo., assignor to Missouri Glass Company, St. Louis, Mo., a Corporation of Missouri. Filed Apr. 14, 1902. Serial No. 100,941. Term of patent 7 years.

Claim.—The design for a glass disk as herein shown and described.

85,893. GLASS DISK. WILLIAM S. CLARK, St. Louis, Mo., assignor to Missouri Glass Company, St. Louis, Mo., a Corporation of Missouri. Filed Apr. 14, 1902. Serial No. 100,942. Term of patent 7 years.

Claim.—The design for a glass disk as herein shown and described.

85,894. BOTTLE. ROBERT H. HUNTER, New York, N. Y. Filed Mar. 21, 1902. Serial No. 100,943. Term of patent 7 years.

Claim.—The design for a bottle substantially as herein shown and described.

85,895. LAMP-GLASS. GEORGE W. BAIN, Pittsburgh, Pa. Filed Mar. 27, 1902. Serial No. 100,944. Term of patent 14 years.

Claim.—The design for a lamp-glass substantially as herein shown and described.

85,896. RING-STRAP FOR HARNESSES. JOHN HENRY ALLEN, Williamsport, Pa. Filed Mar. 29, 1902. Serial No. 100,945. Term of patent 7 years.

Claim.—The design for a ring-strap as herein shown and described.

85,897. FLOWING-TANK. CHARLES SUTHERLAND, Detroit, Mich., assignor to Standard Sanitary Manufacturing Company, Pittsburgh, Pa., a Corporation of New Jersey. Filed Apr. 14, 1902. Serial No. 100,946. Term of patent 7 years.

Claim.—The design for a flowing-tank substantially as herein shown and described.

85,898. FLOWING-TANK. CHARLES SUTHERLAND, Detroit, Mich., assignor to Standard Sanitary Manufacturing Company, Pittsburgh, Pa., a Corporation of New Jersey. Filed Apr. 14, 1902. Serial No. 100,947. Term of patent 7 years.

Claim.—The design for a flowing-tank substantially as herein shown and described.

85,899. FLOWING-TANK. CHARLES SUTHERLAND, Detroit, Mich., assignor to Standard Sanitary Manufacturing Company, Pittsburgh, Pa., a Corporation of New Jersey. Filed Apr. 14, 1902. Serial No. 100,948. Term of patent 7 years.

Claim.—The design for a flowing-tank substantially as herein shown and described.

85,900. SEWING-MACHINE CABINET. THOMAS KIMBLE, Cleveland, Ohio. Filed Apr. 11, 1902. Serial No. 100,949. Term of patent 7 years.

Claim.—The design for a sewing-machine cabinet substantially as herein shown and described.

85,901. CHAIR-BACK. ALBERT WAGNER, Jr., Hoboken, N. J.
Filed Mar. 20, 1902. Serial No. 99,217. Term of patent 14 years.

Claim.—The design for a chair-back as herein shown and described.

85,902. CHAIR-BACK. ALBERT WAGNER, Jr., Hoboken, N. J.
Filed Mar. 20, 1902. Serial No. 99,218. Term of patent 14 years.

Claim.—The design for a chair-back herein shown and described.

85,903. CASKET-BODY. JOHN MATTHEW, Omaha, N. Y. Filed
Apr. 11, 1902. Serial No. 100,482. Term of patent 7 years.

Claim.—The design for a casket-body substantially as herein shown and described.

TRADE-MARKS

REGISTERED MAY 6, 1902.

88,915. GINGER, DRAFTER AND POTTER. Shows Business &
Co., New York, N. Y. Filed June 2, 1901.

A trade mark having a round central field and divergent sections or
petals. Used since April 27, 1900.

88,916. ARTIFICIAL TEETH. CURTIS W. HENSON, Toledo, Ohio.
Filed Apr. 12, 1901.

RIB-ANCHOR.

The compound word "RIB-ANCHOR." Used since April 30,
1900.

88,917. CERTAIN NAMED CARMEN. THE DUNSTON CIGARETTE CO.
Baltimore, W. Va., and New York, N. Y. Filed Mar. 28, 1902.

An Indian represented as standing on a rocky elevation and holding
a bow in hand of outstretched arm and an arrow with the word "DUNSTON"
on the shaft thereof. Used since May 1, 1901.

88,918. RUBBER DUTH AND GROUND. THOMAS CROWLEY, Long
Island, N. Y. Filed Jan. 12, 1902.

The word "TUNNEL" and the pictorial representation of a miner's
cap, lamp, and tools. Used since December 28, 1901.

88,919. LEATHER-LIKE AND WATERPROOF FABRICS AND
CERTAIN CHEMICAL PREPARATIONS. THE NEW YORK LEATHER &
PAINT CO., New York, N. Y. Filed Mar. 14, 1902.

FABRIKOID

The word "FABRIKOID." Used since April 19, 1901.

88,920. MINERAL WATER. AUGUSTE THOMAS WAGNER (KARL-
HEINRICH) AUGUST-GESCHLUSSEN, Als-la-Chapelle, Germany. Filed
Mar. 28, 1902.

A representation of Emperor Charles Magnus and of a shield, as-
sociated with the words "CAROLUS MAGNUS." Used since 1899.

88,921. MINERAL WATER. AUGUSTE THOMAS WAGNER (KARL-
HEINRICH) AUGUST-GESCHLUSSEN, Als-la-Chapelle, Germany. Filed
Mar. 28, 1902.

CAROLUS

The word "CAROLUS." Used since 1899.

May 6, 1902.

88,999. GAS STOVES AND RANGERS. GEORGE W. GAS STOVE CO., New York, N. Y. Filed Apr. 2, 1902.

88,998. STEAM-ENGINE REGISTRATION. RICHARD T. STEAM-ENGINE CO., New York, N. Y. Filed Apr. 2, 1902.

IMPERIAL**Twentieth Century.**

The word "IMPERIAL." Used since September 1, 1900.

The representation of an arrow extending horizontally, with the word "TWENTIETH" adjacent to one end and the word "CENTURY" adjacent to the other end thereof. Used since March 28, 1902.

LABELS

DECISIONS

OF THE
COMMISSIONER OF PATENTS
AND OF
UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

ARBETTER v. LEWIS.

Decided March 20, 1902.

1. INTERFERENCE—TRANSMITTAL OF MOTION TO DISSOLVE.

A motion to dissolve an interference brought after the twenty-day limit allowed by the rule for such motions should be transmitted when the delay is slight and it appears that no testimony has been taken and that a motion to dissolve on another ground is already before the Primary Examiner.

2. SAME—EXCUSE FOR DELAY.

If reasons exist why an interference should not be continued, it is for the interest of all concerned that all such reasons be considered at the same time. Hence the matter submitted in excuse of the delay will not be so closely scrutinized as when presented at a later stage of the proceedings.

APPEAL ON MOTION.

STATE AND METHOD OF MAKING SAME.

Application of Wolf Arbetter filed October 10, 1901, No. 78,177. Renewal application of John G. Lewis filed July 27, 1901, No. 69,990.

Messrs. Crosby & Gregory for Arbetter.

Messrs. Fowler & Fowler and Mr. George H. Evans for Lewis.

ALLEN, Commissioner:

This is an appeal by Arbetter from a decision of the Examiner of Interferences refusing to transmit to the Primary Examiner a motion by Arbetter to dissolve the above-entitled interference.

It appears that a motion to dissolve this interference was brought by Lewis, which motion has not yet been heard by the Primary Examiner. The present motion was brought by Arbetter after the twenty-day limit, within which such motions must be brought under the rule, had expired. As an excuse for the delay an affidavit by a representative of the attorneys for Arbetter is presented, in which it is stated that—

... negotiations were entered into between the parties to the above-named interference with a view of differentiating if possible the construction of the claims of the respective parties, which form the subject-matter of the present interference.

The Examiner of Interferences based his decision refusing to transmit the motion on the fourth paragraph of the syllabus in *Latham v. Force and Parenteau*, (89 O. G., 185,) which is as follows:

The fact that negotiations were pending between the parties with a view to a settlement of the contest without proceeding with the interference is no valid excuse for delay in presenting a motion for dissolution, since the delay which will be excused must be caused by circumstances which have something of a compelling power.

The Examiner of Interferences is of the opinion

99 O. G.—4—11

that this holding is binding upon him, leaving him no discretion as to the transmittal of the motion to dissolve.

It is to be observed that the circumstances in the present case are very different from those in *Latham v. Force and Parenteau*, *supra*. In the case now under consideration no testimony has been taken. There is already before the Primary Examiner for his consideration a motion to dissolve on the ground that Arbetter has no right to make the claims. This motion has not yet come on for hearing. The present interference has not, therefore, progressed beyond the stage which interference proceedings customarily reach within the first twenty days.

This case does not present the same reasons for refusing to consider a motion to dissolve as did that of *Latham v. Force and Parenteau*, *supra*, in which testimony had been taken and a decision on the question of priority rendered. In such a case it would impose hardship on the opposing party by reason of the delay and expense if such a motion were to be considered. When, however, as in the present case, no testimony has been taken and the delay in bringing the motion is slight, no such hardship can arise. If reasons exist why the interference should not be continued, it is for the interest of all concerned that all such reasons be considered at one time, if possible. Hence the matter submitted in excuse of the delay in bringing the motion to dissolve will not be so closely scrutinized as when presented at a later stage of the proceedings. No hard and fast rule can be laid down in these cases, but each one must be considered on its own merits. Reasons which would warrant the transmittal of a motion brought, as was the present one, before the interference has progressed to an advanced stage might not be sufficient if the motion were brought later. This is a matter which, as was stated in *Winter v. Blick v. Vollkommer*, (97 O. G., 1887,) "rests largely within the discretion of the Examiner of Interferences."

In the present case it is desirable that all reasons for dissolution shall be considered by the Primary Examiner when the case comes before him. In view of this fact, therefore, and of the further fact that no hardship will be imposed on the opposing party, Arbetter's motion to dissolve should be transmitted to him.

The decision of the Examiner of Interferences refusing to transmit this motion is reversed.

1893

EX PARTE POWELL.

Decided March 21, 1902.

DIVISION—PROCESS AND ARTICLE OF MANUFACTURE.

Division properly required between a claim for an ax as an article of manufacture and claims for a method of finishing axes, which method is applicable to other articles and does not necessarily result in the particular product.

ON petition.

RECORD BY EXAMINER ALLEN.

Application of Fred T. Powell filed January 6, 1900, No. 88,547.

Messrs. Bakewell & Byrnes for the applicant.

ALLEN, Commissioner:

This is a petition from the action of the Examiner requiring division between the claims of the above-entitled application.

Claims 1 to 3, inclusive, cover a method of finishing axes, and claim 4 covers an ax as an article of manufacture.

Rule 41 permits the joinder in one application of claims for a process and its product. This permission, however, does not go so far as to allow the joinder of a process and its product at the will of the applicant. Due regard must be had for the Office classification and for the relation existing between the two inventions. If it appears that the process and product are classified separately, and, further, if it is clear that the process does not necessarily result in the product or that the product may be made by some other process, the inventions in such a case are independent and should be claimed in separate applications, as provided by Rule 42. (*Ex parte Erdman*, 98 O. G., 2531.)

Applying these tests to the case now under consideration, it is clear that the method covered by claims 1 to 3 is not necessarily confined to axes, but may be used for finishing other edge-tools, such as hatchets, chisels, and the like. Furthermore, the ax covered by claim 4 may be produced by other processes than that described in the other claims. The inventions are therefore independent. The fact that claims 1, 2, and 3 for process are examinable in one division and claim 4 for the ax in another strengthens this conclusion and forms, as above noted, another reason for requiring division. The action of the Examiner requiring division was correct.

The petition is denied.

BENGER & BURSON.

Decided April 15, 1902.

1. INTERFERENCE—THE RESTORATION OF JURISDICTION FOR ONE SPECIFIC PURPOSE DOES NOT OPERATE FOR ALL PURPOSES.

Where a motion is brought to restore jurisdiction to the Examiner of Interferences after the limit of appeal has expired in order that he may consider a motion to transmit a motion for dissolution and the motion is granted for that sole purpose, Held that the jurisdiction of the Examiner of Interferences was not restored for all purposes.

2. SAME—PRIORITY—APPEAL AFTER LIMIT HAS EXPIRED.

Where after the limit of appeal on the question of priority has expired a motion to dissolve is transmitted to the Primary Examiner and decided by him, Held that the party is not entitled thereafter to take an appeal as to priority.

3. SAME—SAME.

While it may have been necessary in justice to both parties to finally determine whether or not an interference in fact existed or whether or not either of the parties had a right to make the claim, the necessity for an appeal to the Examiners-in-Chief from a decision awarding priority on the record is not apparent. Such a course would only operate to delay the final determination of the case.

MOTION to reopen.

TUNULAR EXIT GOODS.

Application of Gottlieb Benger filed December 5, 1899, No. 789,263. Application of William W. Burson filed June 6, 1896, No. 594,485.

Mr. Max Georgitt for Benger.

Messrs. Macleod, Calver & Randall for Burson.

ALLEN, Commissioner:

This is a motion brought by Benger that a new limit of appeal be fixed in order that he may take an appeal to the Examiners-in-Chief on the merits of this interference.

The records show that this interference was declared June 6, 1900.

On August 24, 1900, priority of invention was decided on the record (Rule 114) in favor of Burson and the limit of appeal was set to expire September 14, 1900. On said date a motion was made by Benger to extend the limit of appeal, which was granted on September 15, the time being extended to October 4, 1900.

On October 25, 1900, Benger brought a motion—
to restore jurisdiction of this interference to the Hon. Examiner of Interferences in order that he may consider motions to dissolve said interference made on behalf of said Benger, the motion papers for said motion to dissolve being filed herewith.

In support of this motion certain affidavits were filed setting forth the "reasons why the motion to dissolve was not presented before the expiration of the limit of appeal."

The Commissioner in a decision rendered November 8, 1900, stated:

I have looked into the merits of the case sufficiently to become convinced that Benger should be permitted to file a motion to dissolve the interference. Jurisdiction is therefore restored to the Examiner of Interferences who will exercise his discretion in determining the question whether the motion to dissolve the interference should be transmitted to the Primary Examiner.

It is therefore seen that the motion was brought solely for the purpose of being allowed to file a motion for dissolution and that the Commissioner granted said motion solely for that purpose. While the reasons given for not filing a motion for dissolution within the limits of appeal might very well be held sufficient to excuse the delay, it does not follow that the same reasons would necessarily avail to excuse the same delay in filing an appeal from a decision of the Examiner of Interferences awarding priority on the record under Rule 114. On November 16, 1900, the motion to dissolve the interference was transmitted by the Examiner of Interferences to the Primary Examiner for his determination.

The Primary Examiner held that Burson had a right to make the claims, and that there was an interference in fact, and that there was no such irregularity in declaring the same as to preclude the proper determination of the question of priority.

From the decision on the last two grounds an ap-

peal was taken by Benger to the Commissioner, who in a decision rendered March 4, 1902, affirmed the decision of the Primary Examiner.

On March 12, 1902, the Examiner of Interferences made the following order:

On the 26th day of November, 1901, the Primary Examiner decided a motion to dissolve this interference made on behalf of Benger, and such decision had become final, as has also the decision of priority rendered in favor of Burson on the 14th of August, 1901. It is therefore ordered that this fact be spread upon the interference record, and that the application papers of the respective parties be forthwith transmitted to the Primary Examiner.

Thereupon Benger, on April 1, 1902, brings this motion, which is specified above. The granting of the motion is opposed by Burson.

Benger in his brief states that he believed that—
the restoration of jurisdiction to the Examiner of Interferences was a full restoration for all purposes, and was not to be limited to a specific restoration merely for the purpose of entertaining a motion to dissolve. The question of whether or not this supposition of Benger's was correct is now submitted to the Honorable Commissioner of Patents for his consideration.

It is clear from the record that the supposition of Benger is not correct, for the motion itself is specific in the request that he be allowed to file a motion for dissolution. The decision of the Commissioner is equally specific in granting the motion.

Benger also states that—

the grounds upon which he asks that the motion be granted are fully set forth in the affidavit accompanying the motion to restore jurisdiction granted by the Commissioner of Patents on November 8, 1900.

The grounds then set forth, while undoubtedly sufficient to warrant the grant of the motion at that time and for the specific purpose set forth, are not such as to warrant the grant of this motion now, (nearly one year and five months afterward,) which is brought for a totally different purpose.

While it may have been necessary in justice to both parties to finally determine whether or not an interference in fact existed or whether or not either of the parties had a right to make the claims, the necessity for an appeal to the Examiners-in-Chief from a decision awarding priority on the record is not apparent. Such a course would only operate to delay the final determination of this case.

No reasons now appear to warrant a reopening of this case. The rights of the opposing party as well as those of the moving party should be considered and should have weight in determining a delayed motion, such as the one now under consideration.

The motion is denied.

WHITLOCK AND HUSON v. SCOTT.

Decided April 15, 1902.

1. INTERFERENCE—MOTION FOR DISSOLUTION—NEW FACTS DISCOVERED—PRIORITY.

Upon the discovery of new facts after a motion to transmit a motion for dissolution is granted "the Primary Examiner may consider such facts, provided due and timely notice thereof be given to the party opposing the motion to dissolve." (*Wells v. Fisher*, 90 O. G., 1947.)

2. SAME—SAME—MOTION TO OPPOSE.

If notice of the new facts be served on the opposing party at least five days before the day set for hearing, such notice should be considered as "due and timely."

3. SAME—SAME—SAME—DELAY NOT PERMITTED.

Unless the practice of giving "due and timely notice" on the discovery of new facts is enforced a postponement of the time of hearing becomes necessary, and therefore a delay of proceeding might be obtained by the observance of this practice by the moving party. It is therefore held that such a delay should not be permitted except upon a showing of facts that the new motion could not have been earlier presented. (*Oling Summers v. Hart*, 98 O. G., 2885.)

4. SAME—SECOND MOTION TO DISSOLVE—RESPONSE TO TRANSMIT—DELAY UNNECESSARY.

Where a second motion to transmit a motion for dissolution is brought before the Examiner of Interferences on the ground of the discovery of new references, Held that the consideration of unavoidable delay should be controlling with the Examiner of Interferences, for the granting of the second motion for transmittal necessarily results in a second hearing of the motion for dissolution by the Primary Examiner and the same end would be gained by a different means.

5. SAME—SAME—DELAY NOT UNAVOIDABLE.

Where after a period of three months has elapsed from the date of the decision of priority on the record and it appears that the new references were discovered after a very short search on the morning of the day of hearing among the records of this Office in places where they might be expected to have been found, Held that the delay in discovering the new references was not unavoidable.

APPEAL on motion.

PRINTING PRESS.

Patent granted Sturges Whitlock and Winfield S. Huson November 12, 1900, No. 661,924. Application of Walter Scott filed April 27, 1901, No. 57,739.

Messrs. Seymour & Earle for Whitlock and Huson.

Mr. Richard W. Barkley for Scott.

ALLEN, Commissioner:

This is an appeal by Scott from the decision of the Examiner of Interferences transmitting to the Primary Examiner a second motion for a dissolution of this interference.

The records show that the interference was declared on October 22, 1901, and on November 16, 1901, a judgment of priority was rendered on the record in favor of Scott, the limit of appeal being set for December 7, 1901.

By stipulation of the parties the limit of appeal was extended to December 17, 1901. On said date a motion for dissolution was brought by Whitlock and Huson on the ground that the counts of the issue were not patentable over certain United States patents cited in said motion paper.

On December 23, 1901, the Examiner of Interferences transmitted the motion to dissolve to the Primary Examiner for his determination. Certain motions were subsequently made and proceedings with relation thereto were had, to which it is not now necessary to refer.

The Primary Examiner finally set February 23, 1902, at 10.30 a. m., as the time for hearing the motion to dissolve. It appears that between 10 and 10.30 on the morning of the day of hearing, February 23, 1902, the counsel for the moving party, Whitlock and Huson, together with one of the joint inventors and one of the Assistant Examiners in the division in which this case is pending, found in the Scientific Library of the Patent Office a box of catalogues containing two catalogues published by the Campbell Printing Press Company, in each of which, it is alleged, was illustrated the inking mechanism covered in the issue, and that on the finding of these catalogues it occurred to them that there was a bare possibility that Campbell had taken out an English patent on said inking mechanism, and that upon a search in the files containing the English patents a Patent No. 199 of 1873, which, it is alleged, discloses the inking mechanism of the issue, was readily found.

[Vol. 94. No. 6.]

It also appears that the counsel for the moving party just prior to the time set for the hearing of the first motion and before the argument was begun proposed to the counsel for Scott, who was present, that he accept notice of this additional material which it was desired to cite as further reasons why the interference should be dissolved, and that he agree to a postponement of the hearing, and that times be set for a second hearing, so that the Examiner might consider the new references in rendering his decision.

To this proposition the counsel for Scott did not agree.

The second motion to dissolve was thereupon brought before the Examiner of Interferences on February 26, 1901, who transmitted the same, and from said decision this appeal is taken by Scott.

In the decision of *Wells v. Packer* (90 O. G., 1947) it was held that upon the discovery of new facts after the motion to transmit was granted—the Primary Examiner may consider such facts, provided due and timely notice thereof be given to the party opposing the motion to transmit.

It was also announced in said decision that if notice of the new facts be served on the opposing party at least five days before the day set for hearing such notice should be considered as "due and timely."

In the decision of *Summers v. Hart* (98 O. G., 2665) the decision of *Wells v. Packer*, *supra*, was quoted with approval, and it was further stated that unless the practice of giving "due and timely notice" in such cases was enforced a postponement of the time of hearing would be necessary in order to do justice to the opposing party, and it was pointed out that a delay of the proceedings might thereby be obtained by the observance of this course by the moving party.

It was accordingly held that—such a delay should not be permitted, except upon a showing of facts that the new matter could not have been earlier presented.

It follows, therefore, that this consideration should be controlling upon the Examiner of Interferences in considering the transmittal of a second motion for dissolution, for the granting of the second motion for transmittal necessarily results in a second hearing of the motion for dissolution by the Primary Examiner, and the same end would be gained by a different means.

It is to be determined, therefore, whether or not the delay in this case was unavoidable and whether the new facts could not have been earlier presented. It is to be noticed that a period of over two months was permitted to pass between the date of the first motion and the date of the second motion, and, further, that the moving party took all the time allowed him, a period of one month from the date of the decision of priority, before he brought the first motion.

It also appears that the new references were found in the files of the Patent Office, where they had been during all that time. They were surely not inaccessible, for they were found in the course of a very short search made on the morning of the day of hearing, before the time set for the hearing

[Vol. 29, No. 6.]

had arrived. The only reason which appears why these new references were not found before is that it did not until that morning occur to the parties who made the search to look for them in the way that they did, when their search developed the additional references. The English patents were as accessible at any time during the period of three months as they were on the day that the search was made and the English Patent No. 109 of 1873 found, and the same is true of the catalogues in question.

It is argued that the catalogues were not in the Examiner's room; neither were they placed among the files in the Scientific Library, which are open to the inspection of the public; that they were kept in the alcoves of the library, which are not accessible to the public.

It is true the public is not permitted free access to the alcoves of the Scientific Library; but it does not follow that the public is not permitted to search the books of reference kept therein upon proper request being first made to the librarian or his assistant. The argument could as well be made that none of the many books of reference on file in the alcoves of the Scientific Library were accessible to the public and that therefore it is not necessary to extend a search in said library until one sees fit to do so with the assistance of an employee of this Office.

The facts set forth are not such as to show that these new references could not have been found before.

The records show that counsel for Whitlock and Hason regard the English patent as a better reference for the counts of the issue than the disclosure in the catalogues. It also appears that the counsel for Scott has withdrawn his objections to the consideration by the Primary Examiner of the English patent.

In rendering his decision, therefore, the Primary Examiner may properly consider the English patent referred to in the motion.

Nothing in this decision should be construed to mean that the Primary Examiner should not give due consideration to all anticipating matters of which he may be aware or hereafter discover when the application of Scott comes before him for *ex parte* consideration after the final determination of this interference.

The decision of the Examiner of Interferences is reversed.

EX PARTE RAYMOND.

Decided April 18, 1902.

1. REOPENING REJECTED CLAIMS—SHOWING INSUFFICIENCY.

Where the claims in a case were properly finally rejected and the applicant thereafter sought to amend and as a reason for not amending earlier alleged that prior to final rejection he had been intent in framing claims upon a different view of the invention and references and because the view of the invention contained in the amended claims did not then present itself, *Held* that the showing does not warrant reopening the case for further prosecution before the Examiner. (Citing *ex parte Beckwith*, 91 O. G., 1481.)

2. SAME—ADMISSION OF AMENDMENT FOR PURPOSE OF APPEAL.

Where the new claims sought to be entered after final rejection are not merely those rejected in better form, but differ as to their merits, *Held* that they cannot be admitted under Rule 68 for the purpose of appeal.

3. FINAL REJECTION—NO APPEAL TAKEN WITHIN THE STATUTORY TIME LIMIT—APPLICATION ABANDONED.

Where the final rejection was made on February 27, 1900 and no appeal therefrom was taken within the time limit allowed by the statute, all the intermediate actions being limited to proceedings relative to the admission of an amendment canceling the rejected claims and substituting others in lieu thereof, *Held* that it would be useless to admit claims for the purpose of appeal, as the application is abandoned.

ON petition.

CONFIRMING-MACHINES FOR NEEDS, ETC.

Application of Freeborn F. Raymond, 2d, filed January 18, 1897, No. 619,978.

Messrs. Clarke & Raymond and Mr. Henry Colver for the applicant.

ALLEN, Commissioner.

This is a petition from the action of the Examiner refusing to reopen the above-entitled application after its final rejection and enter and consider certain claims filed in lieu of the finally-rejected claims.

The records show that claims 1, 2, 3, and 4 were finally rejected on certain references on February 27, 1900. This final action was not taken until after two successive arguments had been filed in support of the petitioner's contention that the said claims were patentable.

On February 12, 1901, the petitioner filed an argument and an amendment. The amendment directed the cancellation of the four claims under final rejection and the substitution of four others in lieu thereof. This amendment was properly refused entry by the Examiner on the ground that the petitioner had not complied with the provisions of Rule 68, which relate to the entry of amendments after final rejection.

On July 28, 1901, another amendment was filed similar to that filed on February 12, 1901. To this amendment was attached an affidavit of the petitioner setting forth reasons why the amendment was not earlier presented. The Examiner held that the showing made was not sufficient to warrant a reopening of the case, citing in support of this holding the decisions *ex parte Weller* (91 O. G., 1088) and *ex parte Beckwith*, (95 O. G., 1481). It is from this action that the present petition is taken.

The petitioner has complied with the letter of Rule 68. It is not only necessary that the rule should be complied with in order to warrant a reopening of an application after final rejection, but it is essential that the verified showing required by the rule should be sufficient. This petition presents, therefore, the question of sufficiency of the showing for decision, as the letter of the rule has been complied with.

The showing consists of an affidavit of the applicant setting forth that prior to the final rejection—

"... the applicant had been intent in framing claims upon a different view of the invention and references and because the view of the invention contained in the amended claims did not then present itself."

That the failure to obtain the claims which he considers he is entitled to receive is not due to the relevancy of the references, but to his own inability to properly compare his invention with them and this inability arising largely from the fact that the invention and the references belong to two dissimilar classes thereby making comparison more difficult than it would otherwise be. By his present claims he has attempted to introduce such elements as tend to make the fundamental distinction be-

tween the two types of inventions so apparent that the said references can no longer be urged as containing his invention.

It is further stated that all the amendments have been made in good faith and with no intention of causing delay. This showing does not warrant a reopening of the case for further prosecution before the Examiner.

The record shows that two long and careful arguments were filed without in any way amending the original claims before the final rejection was given by the Examiner. These arguments show that a careful study of the references as they applied to the claims was given by the applicant before the final rejection.

The statements made in *ex parte Beckwith*, *supra*, apply with equal force to this case.

In the brief filed by the counsel for the petitioner it is suggested that the claims should at least be admitted for the purposes of appeal, "as they better define the applicant's invention." This request cannot be granted, for the reason that the new claims are not merely those rejected in better form, but they differ as to their merits. (*Ex parte White*, 98 O. G., 1069.) That the new claims differ from those under final rejection as to their merits is admitted by the applicant in the paper filed October 19, 1901. In this paper it is stated, referring to the new claims, that "we will submit claims which will bring into view an element which has not been before included and that is, &c." This statement clearly shows that in the opinion of the applicant the new claims differ in scope from those under final rejection. The opinion of the applicant in this respect is concurred in.

Furthermore, in this particular case, even though the claims submitted after the final rejection of February 27, 1900, differed from those rejected only as to matters of form, it would be useless to now admit them for the purposes of appeal, because an appeal has not been taken within two years from said date of February 27, 1900.

The petition is denied, and this application is held to be abandoned. (Rules 171 and 68.)

DECISIONS OF THE U. S. COURTS

Court of Appeals of the District of Columbia.

PETRIE & DE SCHWEINITZ.

Decided March 5, 1902.

1. INTERFERENCE—UNSUPPORTED TESTIMONY OF A PARTY.

That the unsupported evidence of a party will not be accepted or acted upon as sufficient proof of the conception of an invention is a well-settled principle, the reasons for which apply with equal force to its reduction to practice.

2. SAME—EVIDENCE AS TO PAST STATEMENTS—CONFESSION.

Evidence that a party at a certain time stated that he had reduced the invention in controversy to practice while admitting as tending to establish the fact of conception is clearly incompetent to prove the independent fact of reduction of that conception to practice.

3. SAME—DILIGENCE.

Where during a delay of six years F. was poor, but concealed his invention and failed to make efforts to interest others in it to assist him in securing a patent or in making practical use of it, *Held* that mere poverty cannot excuse an absence of all effort for such a length of time.

[Vol. 29, No. 6.]

Mr. Cyrus W. Rice, Mr. Clarence K. Chamberlain, and Mr. Harvey S. Knight for the appellant. Messrs. Penne & Goldsborough for the appellee.

SHEPARD, J.:

This is an interference proceeding relating to an improved process for treating tobacco. The issue was declared in the following terms:

1. The process of treating tobacco of inferior quality, consisting, first, in sterilizing the same, under such conditions and sufficiently long continued as to destroy the original bacteria and spores existing thereon, then adding to the sterilized tobacco bacteria or cultures thereof to produce a new and characteristic flavor, and then subjecting the tobacco to fermentation, substantially as set forth for the purpose described.
2. The process of changing the flavor of tobacco, which consists in first treating the tobacco of the species of bacteria originally existing thereon, and then adding in place thereof bacteria or cultures thereof, to produce a new and characteristic flavor, and also a material suitable for bacterial food, substantially as described.

The appellee, De Schweinitz, took no proof, but relied solely upon his application filed in the Patent Office February 4, 1897.

The appellant, Petrie, filed his application August 10, 1899, and introduced evidence under the burden of proof imposed to show conception prior to the record-date of his opponent and actual reduction to practice prior thereto, or else due diligence therein.

The Examiner of Interferences awarded priority to Petrie, but his decision was reversed by the Examiners-in-Chief. Their decision was on appeal to the Commissioner affirmed by him, and further appeal has been prosecuted therefrom.

Petrie's preliminary statement alleged discovery of the invention of count 1 in the summer of 1898, and of that of count 2 not later than June, 1898. He further alleged that he reduced both inventions to actual practice not later than June 15, 1898, and continued his experiments up to the summer of 1899, for the purpose of ascertaining the best method commercially of practicing the process, and produced improved tobacco several times by way of demonstrating the practicability of his process. This was amended subsequently and made to show disclosure to others not later than June 1, 1898, and the production of improved tobacco under both counts prior to June 15, 1898.

The Examiners-in-Chief and Commissioner conceded the early conception of Petrie, but held the evidence insufficient to show either reduction to practice or the exercise of the necessary diligence to that end, before the constructive reduction of his opponent through the application filed.

The process described by Petrie as practiced by him is an elaborate one. He does not claim that even a member of his household saw him conduct one of his numerous experiments. Several witnesses testified that he told them what he had done or was doing in the way of practicing and perfecting his process for improving tobacco, but none saw the process worked. All of his experimentation was secret. This is expressly admitted in his affidavit filed to obtain the amendment of the preliminary statement, in which he says:

During the time that I have been engaged in experimenting and working out my said invention, I have been strongly of the opinion that an inventor, at least until the time of making application for a patent, should not divulge the theory or practice of his invention, but should keep the same within his own knowledge.

Upon the consideration of this evidence, the Commissioner concluded as follows:

The testimony of the witnesses as to what Petrie told them he was doing or intended to do may be taken as showing that he had a conception of the invention at that time, but it cannot be accepted as showing a reduction to practice. Petrie himself is the only one who testifies to an actual performance of the process of the issue. None of the others saw it, and all that they know of it was derived from Petrie's statements. The testimony of these witnesses does not corroborate Petrie's present statement that he successfully performed the process, and his unsupported statement to that effect is insufficient to establish the fact. From the nature of the invention, the result of his experiments performed in secret could not be preserved to show what was done and whether or not it amounted to a reduction to practice of the invention, and his present statement of his conclusion that his experiments were successful and constituted a reduction to practice of the invention is not capable of being rebutted any more than would be the statement of an inventor as to his conception. Considering the natural bias of a party and the incentive to color the testimony in his own interest, it has been repeatedly held that the unsupported testimony of the inventor is insufficient to establish facts of this kind.

In this we fully concur. The evidence of self-serving declarations concerning an invention, while admissible as disclosures tending to establish the fact of conception, are clearly incompetent to prove the independent fact of reduction of that conception to practice.

That the unsupported evidence of a party will not be accepted or acted upon as sufficient proof of the conception of an invention, is a well-settled principle, the reasons for which apply with equal force to its reduction to practice. (*Mergenthaler v. Souder*, 11 App. D. C. 264, 278; *Winslow v. Austin*, 14 Idem, 187, 141; *De Wallace v. Scott*, 15 Idem, 187, 193; *Tyler v. St. Amant*, 17 Idem, 464, 487; *Young v. Donnelly*, C. D. 1898, p. 30.)

The remaining question is whether Petrie, having conceived the invention was exercising diligence in respect of it at the date of De Schweinitz's application.

Without restating the evidence that has been reviewed in the decisions of the Patent Office tribunals, we are content to adopt, as the expression of our opinion on this point, the following extract from the Commissioner's decision:

There is a delay of thirteen years after his alleged conception to be explained. He alleges that for the first seven years, or until 1895, he was searching for the proper "bacterial food," and after that date he was financially unable to apply for a patent. Considering all of the circumstances, these excuses are clearly insufficient. The first rests upon his own statement, and that statement is not consistent with other testimony given by him or with his conduct. He says himself that his invention was complete in 1893, and that the only difficulty was that he was not able to obtain the bacterial food of all times, thus indicating that the trouble, if any, was in his ability to obtain the food easily and not in its character. This view is strengthened by an inspection of the issue and the other claims of Petrie's application, none of which are limited to the particular "bacterial food" obtained from sprouted barley, which is now claimed to be so important. They are broad, and apply to what Petrie claims to have had in 1893. Petrie's own testimony shows that he had ample means to make practical use of the invention or file an application at any time up to 1898.

Even if the time after his discovery of sprouted barley in 1893 is alone considered Petrie did not exercise reasonable diligence. It is true that he seems to have been poor, but there is no showing whatever that he tried to interest others in the invention to assist him in securing a patent or in making practical use of the invention, but, on the contrary, he seems to have intentionally kept it from the public. More poverty cannot excuse an absence of all effort for such a length of time. According to his own showing all that Petrie did between 1893 and 1898 was to make a few experiments in private upon the same lines as his previous experiments, without accomplishing or expecting to accomplish anything further than he had previously accomplished.

This conclusion is amply supported by former decisions of this court where analogous conditions were shown. (*Griffin v. Swenson*, 15 App. D. C. 185, 188; *Platt v. Shipley*, 11 Idem, 878, 888; *Dodge v. Fowler*, 11 Idem, 592, 598; *Marsel v. Decker*, 18 Idem, 532, 534.)

It follows that the decision of the Commissioner must be affirmed. It is so ordered and that this decision be certified to the Commissioner of Patents as the statute requires.

Design Patents.

AN ACT to amend section forty-nine hundred and twenty-nine of the Revised Statutes, relating to design patents.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That section forty-nine hundred and twenty-nine of the Revised Statutes be, and the same is hereby, amended so as to read as follows: "Sec. 4929. Any person who has invented any new, original, and ornamental design for an article of manufacture, not known or used by others in this country before his invention thereof, and not patented or described in any printed publication in this or any foreign country before his invention thereof, or more than two years prior to his application, and not in public use or on sale in this country for more than two years prior to his application, unless the same is proved to have been abandoned, may, upon payment of the fees required by law and other due proceedings had, the same as in cases of inventions or discoveries covered by section forty-eight hundred and eighty-six, obtain a patent therefor."

Approved May 9, 1902.

Attorneys.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., May 8, 1902.

This Office has been advised of the disbarment by the Secretary of the Interior of the following attorney from practice before the Department or any Bureau thereof: James H. Arnold, Ardmore, Ind. Ter., April 20, 1902.

U. H. MILLER,
Chief Clerk.

APPLICATIONS UNDER EXAMINATION.

Conditions of Court of Business May 4, 1902.

Room No.	Divisions and subjects of invention.	Oldest new application and oldest action by applicant awaiting office action.		No. of applications awaiting action.
		New.	Amended.	
	In arrears—Under one month.			
100	II. Farm Stock, Products, etc., Livestock, Poultry, Stationery, etc.	Apr. 17	Apr. 20	205
101	III. Metallurgy, Metal-Founding, Electro-Chemistry, Coating with Metal, etc.	Apr. 16	Apr. 20	161
200	X. Carriages and Wagons.	Apr. 10	Apr. 20	125
201	VIII. Furniture, Store Furniture, Beds, Kitchen and Table Articles, and Clock-Controlled Apparatus.	Apr. 10	Apr. 21	267
211	XXIII. *Optics, *Thermometers, *Lenses and *Prisms, *Optical and *Photography.	Apr. 9	Apr. 20	55
221	XXIII. Acoustics, Electric Signaling, Horology, Recorders, and Registers.	Apr. 9	Apr. 20	109
227	XXX. Paper Manufactures, Lamps and Gas-Fittings.	Apr. 9	Apr. 21	221
44	XXXV. Acoustics, *Lenses, *Prisms, *Optical and *Photography, *Bells, *Gongs, *Chimes, *Harmoniums, *Pianos, *Organs, *Electric and *Magnetic Apparatus, *Pressure Regulators, *Pumps and *Suction Pumps, etc.	Apr. 7	Apr. 24	274
105	XX. Builders' Hardware, Artificial Limbs, Dentistry, Locks and Latches, Safes, and Undertaking.	Apr. 7	Apr. 20	155
120	XXIV. Sewing-Machines, Apparel, Tents, Umbrellas, and Canes, and Toilets.	Apr. 7	Apr. 20	200
206	I. Textiles, etc., and Fumors.	Apr. 7	Apr. 20	130
210	III. Metal-Working, Arms and Projectiles, Making, Boring and Drilling, Hardware-Making, Nails and Spikes, Needles and Pins, Turning, etc.	Apr. 7	Apr. 20	104
207	XV. Plastics, Paper-Making, Paving, Outfitters, Glass, Fuel, Bread-Making, etc.	Apr. 7	Apr. 20	200
200	XIV. Metal-Working, Ornamenting, and Personal Wear, Jewelry, *Watches, *Clocks, *Time-Pieces, *Watches, *Metal Wire Making, etc.	Apr. 7	Apr. 20	240
200	XXVI. Curtains, Shades, and Screens, Drafting, Drifts, Measuring Instruments, and Wind-Wheels.	Apr. 7	Apr. 20	204
200	VI. Chemistry, Explosives, Fertilizers, Medicines, Sugar and Salt, Surgery, etc.	Apr. 7	Apr. 21	200
100	XX. Stoves and Furnaces and Steam-Boiler Furnaces.	Apr. 7	Apr. 21	200
127	XXXI. Gas, Ammonia, Water, and Wood Distillation, Charcoal and Coke, Hides, Skins, and Leather, Oils, Fats, and Glue, Painting, etc.	Apr. 7	Apr. 18	100
	Between one and two months.			
200	XXVII. Brushing and Scrubbing, Grinding and Polishing, Laundry, etc.	Apr. 5	Apr. 20	215
200	XII. Elevators, Journal-Boxes, Pulleys and Shafting, and Machine Elements.	Apr. 5	Apr. 20	200
27	XXVI. Electricity, Generation, Conductors, Motive Power, Medical and Surgical, and Electric Railways.	Apr. 3	Apr. 14	100
20	IV. Cranes and Derricks, Bridges, Fire-Proof Buildings, Excavating, Iron Structures, Conveyors, Hoisting, etc.	Apr. 2	Apr. 10	204
120	XXXII. Bottles and Jars, Carbonating and Dispensing Beverages, *Machineries, *Shipping and *Storing Vessels, Refrigeration, etc.	Apr. 1	Apr. 8	200

Applications Under Examination—Continued.

Room No.	Divisions and subjects of invention.	Oldest new application and oldest action by applicant awaiting office action.		No. of applications awaiting action.
		New.	Amended.	
201	XXXIV. Railways, Railway-Breaks, Draft Applications, and Rolling-Stock, Signals, and Store-Service.	Mar. 21	Apr. 21	200
213	XVII. Printing, Type-Setting, *Lithography, and *Engraving.	Mar. 20	Apr. 11	200
100	XXIII. Fire-Arms, Ordnance, Protection, Navigation.	Mar. 19	Apr. 8	100
120	IX. Hydraulics, Fire-Extinguishers, Baths and Closets, Pumps, Sewerage, and Water Distribution.	Mar. 14	Mar. 20	200
240	VII. Velocipedes, *Clutches, Fire-Engines, *Gears, and Toys, *Ladders, Mechanical Motors, and Fishing and Trapping.	Mar. 6	Apr. 20	200
	Between two and three months.			
120	XXX. Wood-Working Machines, Coopering and Hoisting.	Mar. 5	Apr. 1	210
20	XXVIII. Pneumatics, Air and Gas Engines and Pumps.	Mar. 1	Mar. 15	279
240	XVIII. Steam-Engines, etc., *Spinning, *Weaving, etc.	Mar. 1	Mar. 2	207
20	XXI. Textiles, Carding, Knitting, Spinning, Weaving, etc.	Feb. 20	Feb. 20	240
240	XXV. Artesian and Oil Wells, Butchering, Mills, Stone-Working, Threshing, and Vegetable Cutters and Crushers.	Feb. 24	Feb. 24	200
21	XVI. Telegraphy, Telephony, Electric Lighting, and Special Applications.	Feb. 21	Mar. 2	200

Briefs in Appealed Cases.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., May 4, 1902.

All briefs filed in this Office should have conspicuously printed thereon a statement designating the particular tribunal of the Patent Office to which the brief is addressed.

F. I. ALLEN,
Commissioner.

Correspondence.

1. Communications to the Patent Office must be addressed to the Commissioner of Patents.
2. A double correspondence with the inventor and an assignee, or with a principal and his attorney, or with two attorneys cannot generally be allowed.
3. The assignee of the entire interest of an invention is entitled to hold the correspondence with the Office.
4. Actions by the Office which are wanting in official propriety will be canceled from the files. Communications to the Office in violation of the requirements of decorum and courtesy will not be accepted or will be returned.
5. Separate letters must be written about assignments for record, final fees for patents, orders for copies, abstracts of title, complaints against officials, and every other distinct subject of communication.

PATENTS

GRANTED MAY 13, 1902.

699,687. REFRIGERATOR. ALBERT E. ALDEN, Lexington, Ky.
Filed July 25, 1891. Serial No. 69,724. (No model.)

Claim.—1. In a device of the class specified, a tube containing an agent arranged to move back and forth in said tube longitudinally thereof, said tube having a plurality of legs, an opening for the admission of an air-blast and an orifice between said opening and movable agent.

2. In a device of the class described, a tube containing a movable agent and having a plurality of parallel legs, said tube having an opening for the admission of an air-blast and an orifice between said opening and said movable agent, and a graduated scale coextensive with one of the legs.

3. In a device of the class described, a tube containing a liquid and having a plurality of legs, one of which is of greater diameter than another, said tube having an opening for the admission of an air-blast, and an air-escape orifice between said opening and liquid.

4. In a device of the class described, a tube having a plurality of legs, adapted to contain a body of liquid, and the end of one leg being open to permit the entrance therethrough of a blast of air, said tube having an orifice between the body of liquid and the point at which the air-blast enters the tube.

5. In a device of the class described, a tube bent on itself to form at least three legs, said tube having an orifice at the bend or junction between two of the legs, the opposite ends of the tube being open.

6. In a device of the class specified, a tube containing a movable agent, said tube being arranged to receive an air-blast and having an air-escape orifice between said movable agent and the place at which the air is initially received, a support for said tube, and a gauge.

7. In a device of the class described, a tube having a plurality of substantially parallel legs and an air-escape orifice, one end of the tube being open, and a flexible tube connected with said open end.

8. In a device of the class described, a support and a tube on said support, having a plurality of substantially parallel legs and an air-escape orifice, one of the legs being tapered and having a bulb at its end, and a flexible tube fitted over said bulb, having a manometer.

9. In a device of the class specified, a support and a tube on said support, having at least three legs, the middle one being of greater diameter than the others, and one of the latter being tapered and having a bulb and a flexible tube fitted over said bulb.

10. In a device of the class specified, a bent piece and a chambered two-plate fastened thereon, the latter having an elongated slot, and a tube within the two-plate having a plurality of legs, and a graduated scale observable through said slot and coextensive with one of the legs of said tube.

11. In a device of the class described, a tube containing a movable agent and said tube being arranged to receive an air-blast from the rear, and the tube having means for the escape of air between said movable agent and the place at which the blast is initially received.

699,688. FINE-SEPARATING MACHINE. SAMUEL J. ALLEN,
Galveston, Tex.; C. A. Derricks administrator of said Allen, deceased.
Filed Aug. 13, 1899. Serial No. 237,900. (No model.)

Claim.—1. The combination of a feeding-belt, a feeding-roller having circumferential grooves to embrace and contain the sides of the stems without splitting or crushing them and maintain their parallelism on the moving belt, knives supported centrally with respect to the grooves and in the path of the upper sides of the stems, a hinged support for said knives and springs to hold the knives to their work in a yielding manner.

2. The combination of a feeding-belt with a roller having circumferential grooves to embrace and contain the sides of the stems without splitting or crushing them and maintain their parallelism on the belt, said belt having an elastic support adjacent said roller.

3. The combination of a feeding-belt, a feeding-roller having circumferential grooves to embrace and contain the sides of the stems without splitting or crushing them and maintain their parallelism on the moving belt, knives supported centrally with respect to the grooves and in the path of the upper sides of the stems, a hinged support for said knives and springs to hold the knives to their work in a yielding manner, said knives having cutting edges beveled to the path of the stems.

4. The combination of devices for breaking stalks, plate-faced rollers 8 and 9 acting simultaneously and oppositely on the crushed stalks, a blank provided with a working face curved to correspond to one of the rollers and situated partly between them and extending from near a plane passing through the axis of both rollers to and terminating near a plane passing through the axis of one of the rollers and transversely to the first-named plane, catching devices acting on the material immediately adjacent the termination of said face, and a guide 11 situated in close proximity to the termination of the working face, the rollers and catching device, said guide having a scraping edge contiguous roller 9 and acting oppositely to the direction of the movement of said roller 9 whereby the face is scraped.

5. In a machine for separating fiber, in combination with a slotted reciprocating bar to beat the fiber, a fixed bar correspondingly slotted having tracks bearing on the face of the reciprocating bar to guide said bar in a constant plane and receive the wear, said tracks being removable to provide for renewal.

6. In a machine for separating fiber, in combination with a slotted reciprocating bar to beat the fiber, a fixed bar correspondingly slotted having tracks bearing on the face of the reciprocating bar to guide said bar in a constant plane and receive the wear, said tracks being removable to provide for renewal, and the fixed bar being adjustable.

7. In a machine for separating fiber, the combination of a fixed slotted plate and a reciprocating slotted bar to beat the fiber, said fixed plate having tracks provided with ball-bearings for the reciprocating bar, ball-bearings between the edges of the reciprocating bar and the frame, and said frame.

8. In a machine for separating fiber, a beating-bar, means for reciprocating it, and cushions at its ends to obviate jar and noise.

9. In a machine for separating fiber, a bar in combination with actuating device having a broken connection with the bar alternately acting on each end of the bar to positively reciprocate it.

10. In a machine for separating fiber, the combination of a reciprocating catching-bar, a separating bar, and mechanism for actuating fiber-cleaning tools, and the tools, said tools being carried lengthwise the lower of the two catching-bars in proximity thereto to coast with it to clean the fiber.

11. In a machine for separating fiber, the combination of a reciprocating catching-bar, a separating bar, and mechanism for actuating fiber-cleaning tools, and the tools, said tools being carried in proximity to the lower of the two catching-bars and lengthwise thereof to coast with it to clean the fiber, and the head constituting a continuation of a bar said head having a curved surface conforming to the path of the tools.

12. In a machine for separating fiber, the combination of a reciprocating catching-bar, a separating bar, and mechanism for actuating fiber-cleaning tools, and the tools, said tools being carried in proximity to the lower of the two catching-bars and lengthwise thereof to coast with it to clean the fiber, and the head constituting a continuation of a bar, said head having a curved surface conforming to the path of the tools, and made adjustable to and from the path.

13. In a machine for separating fiber, a scraper for the material, and an elastic holder for said scraper, said holder consisting of an elastic stretched band.

14. The splitting-blades, in combination with means for feeding and guiding the material in parallel lines, and means for holding both the guides and the blades to their work in a yielding manner.

699,680. PAPER-BAG MACHINE. DANIEL APPEL, Cleveland, Ohio, assignor to the Union Paper Bag Machine Company, Philadelphia, Pa. Filed Dec. 26, 1891. Serial No. 57,178. (No model.)

Claim.—1. In a paper-bag machine, the combination, substantially as set forth, of a table, side grippers thereon adapted to hold the lower ends of a blank to the table, a folding-plate disposed in prolongation of the table and hinged thereto, a clamp-bar mounted upon the folding-plate and adapted to clamp all of the piles of the blank thereto, a bearing-plate disposed parallel with the table and having pivotal connection with the folding-plate and link connection with the table, grippers mounted on the bearing-plate and adapted to grip the upper ends of the blank thereto, a follower disposed over the table and presenting an edge above the table at a transverse folding-line of the blank, mechanism for opening and closing the grippers and clamp and moving the bearing-plate to and from the table and turning the folding-plate upwardly and then downwardly to near the table.

2. In a paper-bag machine, the combination, substantially as set forth, of a table, side grippers thereon adapted to hold the lower ends of a blank to the table, a folding-plate disposed in prolongation of the table and hinged thereto, a clamp-bar mounted upon the folding-plate and adapted to clamp all of the piles of the blank thereto, a bearing-plate disposed parallel with the table and having pivotal connection with the folding-plate and link connection with the table, grippers mounted on the

bearing-plate and adapted to grip the upper ends of the blank thereto, a follower disposed over the table and presenting an edge above the table at a transverse folding-line of the blank, mechanism for opening and closing the grippers and clamp and moving the bearing-plate to and from the table and turning the folding-plate upwardly and then downwardly to near the table, and discharge-rolls adapted to take the folded blank from between the table and the folding-plate.

3. In a paper-bag machine, the combination, substantially as set forth, of a table, side grippers thereon adapted to hold the lower ends of a blank to the table, a folding-plate disposed in prolongation of the table and hinged thereto, a clamp-bar mounted upon the folding-plate and adapted to clamp all of the piles of the blank thereto, a bearing-plate disposed parallel with the table and having pivotal connection with the folding-plate and link connection with the table, grippers mounted on the bearing-plate and adapted to grip the upper ends of the blank thereto, a follower disposed over the table and presenting an edge above the table at a transverse folding-line of the blank, mechanism for opening and closing the grippers and clamp and moving the bearing-plate to and from the table and turning the folding-plate upwardly and then downwardly to near the table, discharge-rolls adapted to take the folded blank from between the table and the folding-plate, and mechanism for reciprocating said table to and from the discharge-rolls.

4. In a paper-bag machine, the combination, substantially as set forth, of a table, a folding-plate disposed in prolongation thereof and hinged thereto, a bearing-plate disposed parallel with the table, grippers upon the table and the bearing-plate, a clamp-bar mounted across the folding-plate, springs urging the clamp-bar toward the folding-plate, fixed stops adapted to be engaged by and support the clamp-bar, fixed stops adapted to be engaged by and support the folding-plate, independent transverse-bearings on the folding-plate and clamp-bar, and moving transverse engaging said transverse-bearings.

5. In a paper-bag machine, the combination, substantially as set forth, of a table, a folding-plate disposed in prolongation thereof and hinged thereto, a bearing-plate disposed parallel with the table, grippers upon the table and the bearing-plate, a clamp-bar mounted across the folding-plate, springs urging the clamp-bar toward the folding-plate, fixed stops adapted to be engaged by and support the clamp-bar, fixed stops adapted to be engaged by and support the folding-plate, a crank with its axis in the plane of the surface of the table, a crank-pin carried by the crank, a link-lever having its mid-portion carried by the crank-pin and having one of its ends pivoted at the junction between the table and the folding-plate, independent transverse-bearings on the folding-plate and clamp-bar, and a transverse carrier by the other end of the link-lever and engaging said transverse-bearings.

6. In a paper-bag machine, the combination, substantially as set forth, of a table, a folding-plate disposed in prolongation thereof and hinged thereto, a bearing-plate disposed parallel with the table, grippers upon the table and the bearing-plate, a clamp-bar mounted across the folding-plate, springs urging the clamp-bar toward the folding-plate, fixed stops adapted

ed to be engaged by and support the clamp-bar, fixed stops adapted to be engaged by and support the folding-plate, a crank with its axis in the plane of the surface of the table, a crank-pin carried by the crank, a link-lever having its mid-portion carried by the crank-pin and having one of its ends pivoted at the junction between the table and the folding-plate, a horizontal guideway for the table, and a vertical guideway for said transverse carrier.

7. In a paper-bag machine, the combination, substantially as set forth, of a table, a rear pair of transverse rollers, a forward pair of transverse rollers, horizontal guideways for said transverse rollers, a folding-plate disposed in prolongation of the table and coupled to the forward transverse rollers, a vertical guideway, a crank with its axis in the vertical plane of the vertical guideway, a link-lever carried by the pin of the crank and having its rear end coupled to a forward transverse roller of the table, a transverse carrier by the forward end of the link-lever and adapted to engage the folding-plate and travel in said vertical guideway, a bearing-plate disposed parallel with the table and linked thereto and coupled to said transverse carrier, and holding devices adapted to grip the upper ends of a blank to the bearing-plate and the lower ends of the table and all of the piles to the folding-plate.

8. In a paper-bag machine, the combination, substantially as set forth, of a table, a rear pair of transverse rollers, a forward pair of transverse rollers, horizontal guideways for said transverse rollers, a folding-plate disposed in prolongation of the table and coupled to the forward transverse rollers, a vertical guideway, a crank with its axis in the vertical plane of the vertical guideway, a link-lever carried by the pin of the crank and having its rear end coupled to a forward transverse roller of the table and adapted to travel in said vertical guideway, a clamp-bar disposed across the folding-plate, springs urging the clamp-bar to the folding-plate, ball-bearings on the clamp-bar and the folding-plate and engaging the transverse rollers of the link-lever, a bearing-plate disposed parallel with the table and pivoted to the clamp-bar, side grippers upon the bearing-plate and table, and links connecting the rear portions of the bearing-plate with the rear transverse rollers of the table and having a length equal to that of the link-lever.

9. In a paper-bag machine, the combination, substantially as set forth, with the table, the folding-plate, the bearing-plate, the blank-holding devices, and mechanism for reciprocating the table and opening the folding-plate and holding device, of a follower moving with the table and presenting an edge above the same at the rear folding-line of the blank and adapted to prevent the retreat of the bag when the holding device shall have been released.

10. In a paper-bag machine, the combination, substantially as set forth, of a reciprocating table matched at its forward edge, a folding-plate matched at its rear edge and having its rear edge pivoted to the forward edge of the table, means for holding a blank to the table and folding-plate, means for turning the folding-plate upward and backward upon the table so that the joint edges of the table and folding-plate will present forwardly, and a pair of discharge-rolls disposed in advance of the table and adapted to be engaged by the notches at the joint edges of the table and folding-plate.

11. In a paper-bag machine, the combination, substantially as set forth, of a reciprocating table, a folding-plate with its rear edge hinged to the forward edge of the table, a clamp carried by the folding-plate, a bearing-plate disposed parallel with the table, grippers carried by the bearing-plate and table, means for actuating the clamp and grippers, means for reciprocating the table and turning the folding-plate up and back over the table, feed-rolls disposed at the rear of the table and adapted to feed a tube upon the table, a covering device disposed between the table and the feed-rolls, and discharge-rolls disposed in advance of the table and having a peripheral rate of speed higher than that of the feed-rolls.

12. In a paper-bag machine, the combination, substantially as set forth, of a reciprocating table, a folding-plate with its rear edge hinged to the forward edge of the table, a clamp carried by the folding-plate, a bearing-plate disposed parallel with the table, grippers carried by the bearing-plate and table, means for actuating the clamp and grippers, means for reciprocating the table, means for turning the folding-plate up and back over the table, a pasting-blade disposed over the forward portion of the folding-plate when the latter is in initial position, a spring connected with said pasting-blade and permitting it to yield upwardly, and mechanism for moving said pasting-blade forward away from and then back to the position mentioned.

13. In a paper-bag machine, the combination, substantially as set forth, of a reciprocating table, a folding-plate with its rear edge hinged to the forward edge of the table, a clamp carried by the folding-plate, a bearing-plate disposed parallel with the table, grippers carried by the bearing-plate and table, means for actuating the clamp and grippers, means for reciprocating the table, means for turning the folding-plate up and back over the table, and a follower carried by the table and presenting a thin edge across the table over a folding-line of the blank.

14. In a paper-bag machine, the combination, substantially as set forth, of a reciprocating table, a folding-plate with its rear edge hinged

to the forward edge of the table, a clamp carried by the folding-plate, a bearing-plate disposed parallel with the table, grippers carried by the bearing-plate and table, means for actuating the clamp and grippers, means for reciprocating the table, means for turning the folding-plate up and back over the table, a follower having its rear portion pivotally supported by the table and having its front edge within and disposed across and above the table at a folding-line of the blank, a stop to limit the upward movement of the follower away from the table, and a spring at the pivot-connection of the follower to hold the follower against its stop and permit it to descend toward the table when engaged by the bearing-plate.

15. In a paper-bag machine, the combination, substantially as set forth, of a reciprocating table, a folding-plate with its rear edge hinged to the forward edge of the table, a clamp carried by the folding-plate, a bearing-plate disposed parallel with the table, grippers carried by the bearing-plate and table, a gear carrying a crank-pin connected with said table and folding-plate, a toothed rack engaging said gear, a driving-shaft, and a cam on the driving-shaft and arranged to rock said toothed rack.

16. In a paper-bag machine, the combination, substantially as set forth, of a reciprocating folding device, a pair of feed-rolls disposed to the rear of said folding device and in the plane of movement thereof, a guide-plate disposed between said feed-rolls and projecting toward the folding device, a covering-blade disposed above said guide-plate between the forward and rear ends of the feed-rolls, a covering-arm arranged to move diagonally upward past the end of the guide-plate and past said covering-blade, discharge-rolls in advance of said folding mechanism, means for reciprocating the folding device, and gearing connecting said feed-rolls and discharge-rolls and serving to rotate them continuously and turn the discharge-rolls at a peripheral rate of speed in excess of that of the feed-rolls.

699,640. TROLLEY HEAD OR WHEEL. GEORGE A. KRAMER, New York, N. Y. Filed Sept. 22, 1891. Serial No. 78,898. (No model.)

Claim.—A trolley-head having sliding plates extending from the wheel and formed to cover the side faces of a trolley-wheel and having laterally-extending bearing-ends having inclined upper surfaces, a trolley-wheel journaled between the plates, bearing-plates projected through the laterally-extending bearing-ends, and formed with a central conical collar, and side wheels journaled on the bearing-plates and formed with conical cones to sit over the conical collar, and having conical upper portions and curved lower portions, substantially as and for the purpose specified.

699,641. FLAT-BALL. ARTHUR W. ATLAS and PAUL F. KRAMER, Toledo, Ohio. Filed Mar. 2, 1891. Serial No. 69,424. (No model.)

Claim.—1. A flat-ball formed of two hemispheres of thin sheet metal stiffened and covered by curve-threads rolled in their marginal edges, said coverings being provided with a shoulder and an annular channel, a packing-ring in said channel, and resting against the shoulder, and a frictionally-secured ring for holding the packing-ring, substantially as set forth.

2. A flat-ball formed of two hemispheres having their outer edges rolled into curve-threads portions, a shoulder being thereby formed on one hemisphere to receive the edge of the other, and an inner ring secured inside said shoulder and forming with the shoulder portion on said hemisphere a groove, and a gasket on said groove for making a tight joint between the parts, substantially as described.

699,642. METAL WAGON-CHAM. JAMES E. BAKER, Allegheny, Pa., assignor to the James E. Baker Manufacturing Company, Pittsburgh, Pa., a Corporation of Pennsylvania. Filed Dec. 27, 1900. Serial No. 62,598. (No model.)

Claim.—1. In combination, a wagon running-gear having an axle-tree, a bolster or sand-board, and an axle-arm, the latter having two members each provided with a vertical web reinforced by flanges, between which the axle-tree and the bolster or sand-board are secured.

2. The combination of an axle-tree, a bolster and an axle-arm divided into two branches, one branch flanged to receive the axle-tree and the other branch channel-shaped at its upper end to receive the bolster.

3. A wagon rock-bolster composed of a top and bottom member, a central vertical strengthening-plate between said members and struts tied to said plate and each other between said top and bottom members.

4. An axle-arm provided with flanges between which are secured both the axle-tree and projections from the bolster or sand-board, said axle-arm perforated transversely, whereby the end of a hooped or hooped-bracket can be inserted in and secured to said axle.

5. In a wagon rock-bolster, a central vertical member, reinforced by upper and lower flanges a horizontal top member and two short lower horizontal members, said lower members secured to the lower flanged portion of said vertical member and extending outwardly therefrom.

6. In a wagon rock-bolster, a central vertical flanged member, projections from said member whereby the same can be secured thereto, shoulder projections on said member against which the bottom members of said bolster abut.

7. A wagon rock-bolster, consisting of upper and lower plates united by struts and then, said struts having integral projections extending therefrom and said ties being interposed between and secured to said projections.

8. In a wagon rock-bolster, a central vertical flanged member, a shoulder projection on said member against which a bottom member of said bolster abuts.

9. In combination an axle-tree, a sand-board or bolster and an axle-arm having one of its members composed of a vertical web reinforced by transverse flanges, the axle-tree having one of its ends secured between the flanges of said member and a second member composed of a vertical web reinforced by flanges whereby a projection from the bolster or sand-board can be secured between said flanges.

10. An axle-tree, a sand-board or bolster, and an axle-arm integrally composed of a spindle, a member to which the axle-tree is secured and a second member to which the sand-board or bolster is secured.

11. In a wagon rock-bolster, a central vertical member having a top and a bottom flange, a shoulder projection on the bottom flange, a member abutting against said projection and secured to said bottom flange.

12. An axle-tree, a sand-board or bolster and an axle-arm having a spindle and tapering and extending rearwardly and upwardly from the spindle into two separate members of web formation, to which the axle-tree and sand-board or bolster are secured.

13. An axle-tree, a sand-board or bolster, and an axle-arm having a spindle, and tapering and extending rearwardly and upwardly from the spindle, into two separate members of flanged web formation, to which the axle-tree and sand-board or bolster are secured.

699,643. CONTROLLING ATTACHMENT FOR TROLLEY-POLES. ROBERT J. BAKER, Waltham, Canada. Filed Dec. 10, 1901. Serial No. 62,599. (No model.)

Claim.—1. The combination with the trolley-pole and spring tending to hold it erect, of a countervailing spring means arranged in the path of the pole so that the same might be caught thereby when it flies off the conductor as and for the purpose specified.

2. The combination with a trolley-pole and a spring tending to hold it erect, of a rod having a hooked upper portion to engage said trolley-pole and a spring attached to the lower end of said rod and suitable means for securing said spring to the top of the trolley-car as and for the purpose specified.

3. The combination with a trolley-pole and a spring tending to hold it erect, of a rod having a hooked upper portion to engage said trolley-pole, a spring secured to the lower end of said rod, a casing in which the

lower end of said spring is held stationary and means for securing said casing to the car as and for the purpose specified.

4. The combination with a trolley-pole and a spring tending to hold it erect, of a rod having a hooked upper portion to engage said trolley-pole, a spiral spring, an adjuster immovably secured to the lower end of said rod, and having on its outer circumference a spiral groove designed to receive said spiral spring, a casing to which the lower end of said spring is secured and having a hollow in its upper end through which said rod extends and means for securing said casing to said car as and for the purpose specified.

5. The combination with a trolley-pole and a spring tending to hold it erect, of a bar designed to turn on the same vertical pivot as said trolley-pole, a rod having a hooked upper portion to engage said trolley-pole, a spring attached to the lower end of said hooked rod, a casing to which the lower end of said spring is secured, and having a hole in its upper end through which said hooked rod extends, and means for pivotally securing said casing to said bar as and for the purpose specified.

6. The combination with a trolley-pole and a spring tending to hold it erect, of a bar designed to turn on the same vertical pivot as said trolley-pole, a rod having a hooked upper portion to engage said trolley-pole, a spring attached to the lower portion of said rod, a casing to which said spring is attached at its lower end and having a hole in its upper portion through which said rod extends, a supporting-piece secured to the end of said bar and having upwardly-extending legs formed thereon and a pin or pivot passing through said legs and through holes in the lower portion of said casing as and for the purpose specified.

7. The combination with the trolley-pole and the spring tending to hold it erect, and the hollow bar on which said spring is mounted and the vertical pivot on which said trolley-pole and hollow bar are supported, of a rod having a hooked upper portion designed to engage said trolley-pole, a spiral spring secured to the lower end of said rod, a casing for said spiral spring having a hole in its upper portion through which said rod extends, a rearwardly-extending bar having its forward end secured in said hollow bar, a supporter secured to the rear end of said rearwardly-extending bar, said supporter having upwardly-extending legs and a pin or pivot passing through said legs and said casing, the lower end of said spring being secured to said pin or pivot as and for the purpose specified.

699,644. TABLE. WILLIAM E. BAKER, Chilliota, Ohio. Filed May 2, 1901. Serial No. 62,602. (No model.)

Claim.—1. In a table, the combination with the framework having an opening in the top thereof, of journalled cross-bars 6 below said opening, end-bolts mounted concentrically on said cross-bars, a platform above and supported on said end-bolts and means for rotating said cross-bars, substantially as specified.

2. In a table, the combination with the framework having an opening in its upper side, of journalled cross-bars 9 below said opening, cam-bolts carried thereon, a horizontal platform above said cam-bolts, rollers journalled beneath said platform bearing on said cam-bolts, rigid guide-rods passing through the end and extension of said platform and means for rotating said cross-bars, substantially as specified.

699,645. ACETYLENE-GAS GENERATOR. WILLIAM E. BAKER, Waltham, Mass. Filed June 2, 1901. Serial No. 62,606. (No model.)

Claim.—1. In an acetylene-gas generator, a stationary tank, a bell moving up and down therein having carbide-holders contained in the gas-

chamber therein and connected to a tubular support, an air-chamber centrally disposed in the bell which serves as a guide for said tubular support, and said air-chamber being in open communication with the atmosphere but water-sealed at its lower end, and means for connecting said air-chamber with the gas-chamber when the bell is lifted, substantially as described.

2. In an acetylene-gas generator, a stationary tank, a bell moving up and down therein having carbide-holders contained in the gas-chamber therein and connected to a tubular support, an air-chamber centrally disposed in the bell which serves as a guide for said tubular support, and said air-chamber being in open communication with the atmosphere but water-sealed at its lower end, and a pipe connecting said air-chamber with the gas-chamber of the bell, normally closed by a water seal, substantially as described.

3. In an acetylene-gas generator, a stationary tank, a bell moving up and down therein having carbide-holders contained in the gas-chamber therein and connected to a tubular support, an air-chamber centrally disposed in the bell which serves as a guide for said tubular support, and said air-chamber being in open communication with the atmosphere but water-sealed at its lower end, and a trap-pipe contained in said air-chamber connected with the gas-chamber of the bell, substantially as described.

4. In an acetylene-gas generator, a stationary tank, a bell moving up and down therein having carbide-holders contained in the gas-chamber therein and connected to a tubular support, an air-chamber centrally disposed in the bell which serves as a guide for said tubular support, and said air-chamber being in open communication with the atmosphere but water-sealed at its lower end, and a trap-pipe contained in said air-chamber the lower end of which is connected with the lower part of the gas-chamber, which when closed by the water forms a water seal which closes the passage between the gas-chamber and the air-chamber, substantially as described.

5. In an acetylene-gas generator, a stationary tank and a bell working up and down therein having a gas-chamber, carbide-holders contained therein having sloping top walls for shading the carbide, substantially as described.

6. In an acetylene-gas generator, a stationary tank, a bell working up and down therein having a gas-chamber, carbide-holders contained therein, a support therefor to which a float is attached and a conducting-passage leading from the carbide-holders to the top of the gas-chamber, substantially as described.

7. In an acetylene-gas generator, a stationary tank, a bell working up and down therein having a gas-chamber, carbide-holders contained therein, a tubular support to which said carbide-holders are attached consisting of two cylinders of different diameter contained one within the other to form an annular space between them, said tubular support having openings communicating with said carbide-holders and terminating at the top of the gas-chamber and its annular space being open at the top to thereby deliver the gas to the top of the gas-chamber, substantially as described.

8. In an acetylene-gas generator, a stationary tank, a bell working up and down therein having a gas-chamber, an outlet from the gas-chamber to the atmosphere, carbide-holders contained within the bell above said outlet and a supplemental carbide-holder contained within the bell below said outlet, substantially as described.

9. In an acetylene-gas generator, a stationary tank, a bell working up and down therein having a gas-chamber, a trap-pipe leading from the gas-chamber which is in open communication with the atmosphere, carbide-holders contained within the bell above said trap-pipe and a supplemental carbide-holder contained within the bell below said trap-pipe, substantially as described.

10. In an acetylene-gas generator, a stationary tank, a bell working up and down therein having a gas-chamber, carbide-holders contained therein having sloping top walls, a tubular support to which said carbide-holders are attached consisting of two cylinders of different diameter contained one within the other to form an annular space between them, said tubular support having openings communicating with said carbide-holders and terminating at the top of the gas-chamber and its annular space being open at the top to thereby deliver the gas to the top of the gas-chamber, substantially as described.

699,646. STEAM-TRAP. CHARLES E. BERRY, Manchester, England. Filed Apr. 20, 1901. Serial No. 62,608. (No model.)

Claim.—1. In a steam-trap of the class described, an inlet-tube having a high coefficient of expansion and fixed at one of its ends, an outlet-tube having a low coefficient of expansion and fixed at one end parallel with the inlet-tube, a valve-bar mounted upon the free ends of the parallel tubes, a valve within the valve-bar between the tube-openings, a valve-spindle projecting through the upper part of the valve-bar, a lever having a straight part above the valve-spindle and a curved part and being fulcrumed between the straight and curved parts, an arm pivoted in the center of curvature of the lever and capable of being moved in its plane, a compressed spring between the arm-pivot and the curved part of the lever and tending to force the end of the lever against the valve-spindle, and adjusting-nuts on the arm whereby the said tendency can be regulated, substantially as set forth.

2. In a steam-trap of the class described, an inlet-tube having a high coefficient of expansion and fixed at one of its ends, an outlet-tube having a low coefficient of expansion and fixed at one of its ends parallel with the inlet-tube, a valve-bar mounted on the free ends of the parallel tubes, a valve within the valve-bar between the tube-openings and having a projecting valve-spindle, a spring-controlled lever in working contact with the valve-spindle, and means for varying the point of attachment of the spring to said lever, substantially as set forth.

3. In a steam-trap of the class described, the combination with a valve and its stem, of a curved lever having an arm adjacent to said valve-stem, an arm pivoted in the center of curvature of the lever and capable of being engaged therewith nearer to or further from the fulcrum, a compression-spring between the arm-pivot and the lever, and nuts whereby the compression of the spring can be adjusted, substantially as set forth.

699,647. SAFETY-FUSE FOR ELECTRIC CIRCUITS. DAVID G. BLACK, Brooklyn, N. Y. Filed Jan. 3, 1900. Serial No. 62,607. (No model.)

Claim.—1. The safety-fuse for electric circuits comprising the insulating casing subdivided into substantially independent chambers, the conductor 21 in one of said chambers, the conductor 20 usually in the other of said chambers but extended into the first chamber where it is connected with the conductor 21 by a small quantity of easily-fusible metal, the heat-cell in the conductor 21 adjacent to said fusible metal, and means for with-

drawing the conductor 20 entirely within its own chamber upon the softening of said metal; substantially as set forth.

2. A safety-fuse for electric circuits comprising the conductors 20, 21, and a small quantity of easily-fusible metal connecting said conductors, one of said conductors having a heat-coil adjacent to said fusible metal, and the other conductor having the spring for effecting the separation of the conductors upon the softening of said metal, combined with a substantially air-tight coating covering said heat-coil and fusible metal, said coating being composed of non-conducting and non-inflammable substances; substantially as set forth.

3. A safety-fuse for electric circuits comprising the conductors 20, 21, and a small quantity of easily-fusible metal connecting said conductors, one of said conductors having a heat-coil adjacent to said fusible metal, and the other conductor having the spring for effecting the separation of the conductors upon the softening of said metal, combined with the plaster-of-paris coating covering said heat-coil and fusible metal; substantially as set forth.

4. A safety-fuse for electric circuits comprising the conductors 20, 21, and a small quantity of easily-fusible metal connecting said conductors, one of said conductors having a heat-coil adjacent to said fusible metal, and the other conductor having the spring for effecting the separation of the conductors upon the softening of said metal, combined with the substantially air-tight coating covering said heat-coil and fusible metal and having an asbestos lining about the conductor 20; substantially as set forth.

5. A safety-fuse for electric circuits comprising separable conductors normally connected together by a small quantity of metal fusible under the thermal effect of the current, a substantially air-tight coating applied at the point where said conductors are to separate, and means for effecting the separation of said conductors upon the softening of said metal; substantially as set forth.

6. A safety-fuse for electric circuits comprising the insulating casing and the conductors 20, 21, incased within said casing and normally connected together by a small quantity of fusible metal, one of said conductors having a heat-coil adjacent to said fusible metal, and the other conductor having a spring for effecting the separation of the conductors upon the softening of said metal, and said casing having a spy-hole, combined with the indicating-plate connected with the movable conductor and visible at the proper time as said spy-hole to denote the relation of the said conductors to each other; substantially as set forth.

699,648. CHAIN-PUMP-TYPE COUPLING. Leo A. Brown, Jr., Cincinnati, Ohio. Filed Apr. 10, 1901. Serial No. 66,181. (No model.)

Claim.—1. In a chain-pump, a reservoir formed of a cast-metal bottom section provided with a rib upon the upper and lower side of the outer edge thereof, sheet-metal side walls, and folds upon the lower edges thereof adapted to take over and engage said ribs, substantially as set forth.

2. A chain-pump provided with sections of tubing, coupling-sections taking over the abutting ends of said tubing, means for drawing and holding said coupling-sections together against endwise movement, said means comprising ears and inclined ways, and ears on the exterior of the male and female coupling-sections adapted to be secured to each other by suitable fastening devices whereby the coupling-sections are drawn and locked in alignment in the adjusted position and said fastening devices.

3. In a chain-pump, a tube-coupling consisting of a male coupling-section provided with a series of locking-ears, a female coupling-section provided with recesses for the passage of the locking-ears of the male section and with inclined ways along which the ears of the male section slide and ears on the exterior of the coupling-sections adapted to shut and means for positively drawing and holding the ears together to prevent the disengagement of the coupling-sections, substantially as specified.

4. In a chain-pump a reservoir having a coupling-section formed integral therewith, a tube having coupling-sections at opposite ends; a funnel having a coupling-section formed integral therewith, said interengaged coupling-sections being held against displacement endwise by means of ears engaging inclined ways, and being held and locked in alignment in the adjusted position by means of abutting ears and bolts passing through the same.

699,649. MACHINE FOR PERFORATING PAPER. Dr. JAMES R. BROW, New York, N. Y., assignor to "Adit" Manufacturing Company, a Corporation of New York. Filed July 22, 1901. Serial No. 69,649. (No model.)

Claim.—1. The combination of a suitably perforated pattern-sheet, the operating guide-bars 8, 9, therefore; a range of selecting-rod 18, depressed by the contact of imperforate parts of the pattern-sheet; a range of spring-pressed arms 19 applying upward pressure to the respective selecting-rod; a range of perforating-punches 21 corresponding to the selecting-rod in number and relative position; a range of spring-pressed vibrating arms 26, controlled in position by the depression of the corresponding selecting-rod 18 and arms 19 and constructed with projections and depressions, which are respectively presented to the punches to as to render them operative only when the corresponding selecting-rod is advanced by the pressure of a perforation in the pattern-sheet, the vibrating frame 50, 51, for returning the arms 26 to permit descent of the selecting-rod; and means for forcing paper to be perforated against the punches, substantially as described.

2. The combination of the spring-pressed vibrating levers 26, having protuberances 20 and recesses 29 at their free ends and projecting lugs 31 at their fulcrum ends; a range of selecting-rod 18 adapted to bear endwise against the pattern-sheet and to enter perforations therein;

a corresponding range of spring-pressed levers 19 controlled in position by the respective selecting-rod and controlling the corresponding levers 26 by contact of the lug 31 therein; a corresponding range of perforating-punches 21 controlled in their endwise movement by the operation of the protuberances 20 or recesses 29 of the levers 26; and means for pressing the paper 25 against the punches and thereby perforating the paper by each of the punches as are opposed by the protuberances 20, as explained.

3. The combination of corresponding ranges of selecting-rod 18 and perforating-punches 21, vibrating guide-frames 8, 9, and 24, 27 for the pattern-sheet and paper respectively; interposed spring-pressed levers 19 and 26 controlling the movement of the punches by the position of the corresponding selecting-rod; and means for imparting step-by-step feed movement to the pattern-sheet and the cam-shaft 74 having suitable means for actuating the feed mechanism and interposed controlling devices, substantially as described.

4. In a machine for perforating paper under control of a pattern-sheet, the combination of the pattern-sheet 1, adjustable edge-guides 4 for the pattern-sheet, toothed feed-cylinder 65 and take-up roll 66, and means for operating the same, substantially as described.

5. In a machine for perforating paper or the like, the combination of a series of perforating-punches, a guide-frame for the paper vibrated to apply perforating pressure to the paper against the punches; edge-trimming devices operated by said vibrating guide-frame, and means for conveying away the waste edges, substantially as set forth.

699,650. GAS-FIXTURE. GEORGE F. BRYAN, Chicago, Ill., assignor to Edward R. Hollerton and Fred Garisch, trustees, Chicago, Ill. Filed June 2, 1901. Serial No. 68,196. (No model.)

Claim.—1. A gas-fixture comprising the combination with a bracket formed with a screw-thread whereby the bracket can be attached to the screw-threaded terminal of a fixed pipe or support, of a burner-carrying standard adjustably held in said bracket, and a flexible section secured to said standard, said bracket having a gas-port extending therethrough, said section being secured also to said bracket.

2. A gas-fixture comprising the combination with a bracket formed and adapted to be attached to a fixed pipe or support, of a burner-carrying standard adjustably held in said bracket, and a flexible section secured to said standard, said bracket having a gas-port extending therethrough, said section being secured also to said bracket.

3. A gas-fixture comprising the combination with a bracket formed and adapted to be attached to a fixed pipe or support, of a burner-carrying standard, a flexible pipe-section secured to said standard and connected with said bracket, a plurality of steps on said standard, said steps being arranged to secure the standard at different elevations in said bracket.

4. A gas-fixture comprising the combination with a bracket formed and adapted to be attached to a fixed pipe or support, of a burner-carrying standard, a flexible pipe-section secured to said standard and connected with said bracket, said bracket having a socket therein and a plurality of steps on said standard, said steps fitting within said socket and being arranged to adjustably secure said standard at different elevations.

5. A gas-fixture comprising the combination with a bracket formed and adapted to be attached to a fixed pipe or support, of a burner-carrying standard, a flexible pipe-section secured to said standard and connected with said bracket, said bracket having a socket therein and an opening wherethrough the standard can be withdrawn laterally, and a plurality of steps on said standard, said steps fitting within said socket and being arranged to adjustably secure said standard at different elevations.

6. A gas-fixture comprising the combination with a bracket formed with a screw-thread whereby the bracket can be attached to the terminal of a fixed pipe or support, of a burner-carrying standard adjustably held in said bracket, a flexible section secured to said standard and connected with said bracket, and a stem secured to said bracket and having a nut wherein the standard will be held, to provide an additional lateral support for the standard.

699,651. ELECTRIC HEATER. MARTIN G. BURN, Chicago, Ill. Filed Oct. 28, 1901. Serial No. 69,568. (No model.)

Claim.—1. In an electrical heater, the combination with a hollow supporting member having an insulated perforated section, of a series of resistance-plugs 7 secured on the section, a resistance-coil surrounding the perforated section and means for forcing air through the support, and connections 7 between the adjacent plugs.

2. In an electrical heater, the combination with a hollow support having a perforated portion, of a series of plate resistance-coils secured on the perforated portion, a resistance-coil surrounding the perforated portion and passing into and out of the same at the point where the plates are connected, and means for forcing air through the perforations.

3. The combination with a perforated supporting member, of a resistance-coil surrounding the same and having portions projecting into the perforated portion, a resistance-coil surrounding the perforated portion and passing into and out of the same at the point where the plates are connected, and means for forcing air through the perforations.

4. An electric heater provided with a plurality of plates or disks, connections between the same, and a resistance-coil arranged longitudinally of the heater and with its turns encircling plates intermediate of the adjacent pairs of plates or disks; substantially as described.

5. An electric heating apparatus comprising a longitudinally-disposed perforated hollow pipe, means encircling said pipe at separated points, a resistance-coil surrounding the pipe in each box, and resistance plates or disks on said pipe disposed between the turns of the coil in each box, substantially as described.

6. An electric heating apparatus comprising a longitudinally-disposed perforated pipe, a box inclosing said pipe, a resistance-coil in said box and surrounding the pipe therein, and resistance plates or disks on said pipe disposed between the turns of the resistance-coil, substantially as described.

699,652. APPARATUS FOR DIFFUSING VAPORIZABLE SUBSTANCES. JOHN D. CAMPBELL and WILLIAM E. YATES, Manchester, England. Filed Aug. 29, 1901. Serial No. 72,702. (No model.)

Claim.—1. An apparatus for diffusing vaporizable substances through the air, consisting of a vessel, a funnel opening into the upper part of said vessel, a loose light valve controlling the passage through said funnel, and means for guarding said funnel from overheating.

2. An apparatus for diffusing vaporizable substances through the air, consisting of a vessel, a funnel opening into the upper part of said vessel, a loose light valve controlling the passage through said funnel, and a heat-resisting medium interposed between said funnel and the vessel, in which vaporization takes place.

3. An apparatus for diffusing vaporizable substances through the air, consisting of a vessel, a funnel opening into the upper part of said vessel, a loose light valve controlling the passage through said funnel, and a water-jacket surrounding said funnel.

699,653. DENTAL VULCANIZER. JOHN E. CAMPBELL, London, England. Filed June 2, 1901. Serial No. 68,709. (No model.)

Claim.—1. In a vulcanizer the combination of a vulcanizing-chamber provided with an opening on one side thereof, a door-supporting member pivotedly connected near its opposite ends to the vulcanizer and having

a horizontal path of movement, a door carried by said member, and means for opening and closing the same, substantially for the purpose specified.

2. In a valveless the combination of a valveless-chamber provided with an opening on one side thereof, a door-supporting member having a horizontal path of movement, a door carried by said member, means for actuating the door, and means for limiting the movement of said door-supporting member when the door is in the correct position for closing, substantially for the purpose specified.

3. In a valveless the combination of a valveless-chamber provided with an opening on one side thereof, a door-supporting member having a horizontal path of movement, said member consisting of a pair of arms, one pivoted to the top and the other to the bottom of said chamber, and a yoke connecting said arms, a door carried by said yoke, means for actuating the door, and a stop for limiting the movement of the door-supporting member, substantially as and for the purpose specified.

4. In a valveless the combination with a chamber provided with an opening on one side thereof, a door-supporting member having a horizontal path of movement, and consisting of a pair of arms, one pivoted to the top and the other to the bottom of said chamber and a vertical yoke connecting said arms, a door carried by said yoke, and means for actuating said door.

5. In a valveless the combination of a valveless-chamber provided with an opening on one side thereof, a pair of arms and a vertical connecting-yoke constituting a door-supporting member, said arms being pivoted to the chamber one at the top and the other at the bottom thereof, at the central vertical axis of the valveless, and a door and means for actuating it carried by the yoke.

6. In a dental valveless the combination of a valveless-chamber with opening at the side, a supporting-bar, and a drainage-tray on said base, substantially as and for the purpose set forth.

7. In a dental valveless the combination of a valveless-chamber with opening at the side, a pivoted yoke carrying a door, a supporting-bar with notches, projections on said chamber engaging with said notches, a drainage-tray and a dust leading from said tray, substantially as and for the purpose set forth.

8. In a dental valveless the combination of a valveless-chamber, an opening thereto at the side, an arm pivoted to the top of said chamber, an arm pivoted to the bottom of said chamber, a yoke connecting said arms, a cover in said yoke, a door carried by said cover, an abutment for said arm, a supporting-bar, a casing connecting said chamber and said base, and a drainage-tray on said base, substantially as and for the purpose set forth.

699,654. ELECTRIC FURNACE. CHARLES DE CHALING, Holbrook, N. Y., assignor to the Wilson Aluminum Company, New York, N. Y., a Corporation of New York. Filed July 8, 1900. Serial No. 698,493. (No model.)

Claim.—1. In an electric furnace the combination with the pot and carbon pencil entering it, of a cover for the furnace consisting of a plurality of sections fitting closely together, each formed of hollow metal with a water-chamber within it and vent-pipes for causing water to flow through said chamber, the opening through which said pencil passes being formed partly in each of two adjoining sections, which may remain in place undisturbed during the operation, while other sections are removable independently thereof for striking.

2. In an electric furnace, the combination with the pot A and carbon pencil B entering it, of a cover C for said pot having a hole through which said pencil may pass, and constructed in sections, said sections fitting closely together and being separately removable, and base D D taking under the ends of said sections for fitting said cover bodily.

3. In an electric furnace, the combination with a pot or crucible, a carbon pencil entering thereto, a cover for said pot, hinged to the pot, electrically connected to the carbon pencil, and having an opening through which the carbon pencil may pass, and a base stuffing-bar ap-

plied to said cover around said pencil, comprising a flange packing, and means for retaining the same against the pencil, said stuffing-bar adapted to permit the pencil to be freely adjusted through it, while preventing gases passing through the opening around the pencil.

4. In an electric furnace, the combination with a pot or crucible, a carbon pencil entering thereto, a cover for said pot having an opening through which the pencil may pass, and a stuffing-bar applied to said cover around said pencil, consisting of relatively adjustable sections of sheet metal having each a base of flange and means for fastening the same adjustably to said cover, and having each an upper portion adjacent to the pencil forming a chamber for retaining a flange packing against the pencil.

5. In an electric furnace, the combination with pencil B and cover C, of a stuffing-bar E comprising sheet-metal sections G having dotted base-flanges F and upright chambered portions A, with clamping devices for engaging their base portions and fastening them adjustably to the cover.

699,655. APPARATUS FOR PURIFYING WATER. WILLIAM C. CLARK, Pittsburgh, Pa., assignor to James V. Smith, Pittsburgh, Pa. Filed Sept. 18, 1901. Serial No. 73,498. (No model.)

Claim.—1. In a water-purifying apparatus a precipitating-tank, a supply-pipe, its exit being near the bottom of the tank, a pipe connected to said main pipe whereby a neutralizing solution is discharged thereto, and a pipe entering said tank and said main pipe inside the tank, whereby a precipitating solution is discharged thereto.

2. In a water-purifying plant, a precipitating-tank, a main supply-pipe leading thereto and having its exit near the bottom thereof, a pipe discharging neutralizing solution into the main pipe, and a second pipe entering the main supply-pipe near its exit in the tank for discharging a precipitating solution thereto.

3. In a water-purifying plant, a precipitating-tank, a main supply-pipe having its exit near the bottom of the tank, pipes for discharging neutralizing and precipitating solutions into the main pipe, one of the solution-discharging pipes having its exit near the bottom of the main pipe.

4. In a water-purifying plant, a precipitating-tank, a main supply-pipe having its exit near the bottom of the tank, pipes for discharging neutralizing and precipitating solutions into the main pipe, one of the solution-discharging pipes having its exit near the bottom of the main pipe, the said tank having its outlet near its top.

699,656. HOSE-RECK. HOWARD CLAY, Newark, N. J., assignor to Cliff and Galt Company, New York, N. Y., a Corporation of New York. Filed Dec. 28, 1901. Serial No. 67,647. (No model.)

Claim.—1. The hose-reck comprising the supporting-bar secured at one end and free at the other end, and the series of rings for suspending the hose in folds or loops from said bar, said rings being freely strung upon the hose so as to be movable thereon and adapted while on the hose to pass upon and hang from said bar and suspend the folded hose, and said rings being of sufficient diameter to permit the expansion therein of the hose when the latter is in use; substantially as set forth.

2. The hose-reck comprising the supporting-bar, and the series of rings strung upon the hose for suspending the latter in folds or loops from said bar, said rings being adapted while on the hose to pass upon and hang from said bar and suspend the folded hose, and said rings being split to admit the flattened hose into the inclosure formed by the rings; substantially as set forth.

3. The hose-reck comprising the supporting-bar, and the series of rings strung upon the hose for suspending the latter in folds or loops from said bar, said rings being adapted while on the hose to pass upon and hang from said bar and suspend the folded hose, and said rings having substantially horizontal lower sides of a length corresponding with the width of the hose when the latter is flattened; substantially as set forth.

4. The hose-reck comprising the supporting-bar, and the series of rings strung upon the hose for suspending the latter in folds or loops from said bar, said rings having the substantially horizontal lower sides of a length corresponding with the width of the hose when the latter is flattened, and said lower sides at about their central portion being split to admit the hose into the inclosure formed by the rings; substantially as set forth.

5. The hose-reck comprising the horizontal bar having the longitudinal runways at the opposite ends of its upper surface, and the brackets to which said bar is pivoted, combined with the series of rings strung upon the hose for suspending the latter in folds or loops from said bar, the upper sides of said rings being adapted to said runways and the lower sides of said rings being adapted to hold the flattened hose; substantially as set forth.

6. The hose-reck comprising the supporting-bar, and the series of rings strung upon the hose for suspending the latter in folds or loops from said bar, said rings at their upper sides substantially corresponding with the width of said bar and at their lower sides substantially corresponding with the width of the hose when flattened; substantially as set forth.

699,657. STOPPER FOR VIBRIOLA. FRANK C. CONNELL, Washington, D. C. Filed Oct. 21, 1901. Serial No. 58,590. (No model.)

Claim.—As a new article of manufacture, a stopper for vibras, consisting of a thin paper disk, adapted to be sprung into the neck of a bot-

tle and provided with a staple adapted to form a handle, made of flexible wire, bent to form a loop on one side of the disk and having its ends or legs passed through the disk and bent on the opposite side thereof parallel to the bottom of the disk to clamp the same thereto, substantially as set forth.

699,658. STORAGE BATTERY. HENRY J. OGDEN, Hartford, Conn., assignor to the Hartford Accumulator Company, Hartford, Conn., a Corporation of Connecticut. Filed Oct. 28, 1900. Serial No. 734,811. (No model.)

Claim.—1. As an improved article of manufacture an electrode comprising a body portion, a series of annular flanges equally disposed along said electrode, and fixed abutments arranged at intervals between each series of annular flanges, both the flanges and abutments being formed in the body portion of the electrode.

2. As an improved article of manufacture an electrode comprising a core of antimony lead bearing fixed abutments disposed at intervals along said electrode, a filling of soft lead arranged between said abutments and divided into a series of flanges, said soft lead being closely united to the core of antimony lead.

3. As an improved article of manufacture an electrode comprising a core and fixed abutments disposed at intervals along the core, a holder for an active material arranged upon said core between the abutments and consisting of a soft lead, said holder being divided into a series of flanges and the whole electrode being substantially cylindrical in cross-section.

699,659. GAS STOP-COCK. WILLIAM R. OLIVER, Worcester, Mass. Filed Aug. 10, 1900. Serial No. 58,591. (No model.)

Claim.—1. In a gas stop-cock, comprising a tapered rotating key having a tapered end fitting the key, the combination with the tapered rotating key of a pin having a tapered and projecting from the key, a fixed bar arranged to bear against the tapered end of said pin, and means for advancing said pin and bar in order to compress the key, substantially as described.

2. In a gas stop-cock, the combination of a pipe having a tapered end, a tapered rotating key fitting said end and having a transverse screw-threaded hole, a screw-threaded pin held in said transverse hole and having a tapered end projecting beyond the periphery of the key, said pipe having a surface arranged to bear against the tapered end of the pin, whereby said key is crowded against its seat by advancing said screw-threaded pin in the key, substantially as described.

3. The combination of a rotary plug-valve, a body in which said valve is fitted to seat and turn, an inclined cam-face formed on the exterior of the valve-body adjacent to one end of the valve-seat, in position to limit the traverse of the valve in one direction, and a locking device connected to the valve and adapted to permit free movement thereof throughout the middle portion of its traverse and to abut against the cam-face adjacent to one of the limits of said traverse.

4. The combination with a pipe, having a key-seat, of a rotating key, a projection on said key, a flange projecting from the pipe, and including a portion of said key, cam-surfaces on each side of said flange and arranged to bear against the projecting end of said projection as the key is rotated.

699,660. POLARIZED ELECTROGRAPHIC APPARATUS. FRANK R. COLE, Chicago, Ill. Filed Aug. 28, 1900. Serial No. 734,812. (No model.)

Claim.—1. In a polarized electrographic apparatus the combination of a polarized and plotted structure, a two-part magnetic casing or

shell, said armature being positioned between the ends of the two-part shell and said casing or shell surrounding the electromagnet.

2. In a polarized electromagnetic apparatus, the combination of a polarized and pivoted armature, a two-part magnetic casing or shell, said armature encircling the electromagnet and positioned between the ends of the shell and said casing or shell surrounding the electromagnet.

3. An electromagnetic apparatus, consisting of an armature, a two-part magnetic casing or shell, an extension of said armature, a bracket and a spring connected with the armature and bracket, together with means for regulating the tension of the spring.

4. In a polarized electromagnetic apparatus, the combination of a polarized and pivoted armature, a two-part magnetic casing or shell having a tapered end or index, said armature being positioned between the ends of the two-part shell and said casing or shell surrounding the electromagnet.

5. In a polarized electromagnetic apparatus, the combination of a polarized and pivoted armature, a two-part magnetic casing or shell, said armature positioned between the ends of the casing or shell and means for adjusting the parts of the armature in relation to said ends, the said casing or shell surrounding the electromagnet.

699,661. BALING-PRESS. THOMAS J. CONNOR, Sterling, Ill. Filed June 1, 1891. Serial No. 69,661. (No model.)

Claim.—1. In a baling-press, a bed-plate located at the end opposite the bale-chamber, a trip-arm 22 rigidly secured to the upper face of the bed-plate, an upright end-shaft rigidly secured to said trip-arm, a substantially elliptical cam 18 mounted rotatably on said end-shaft, a crank for rotating said cam, a pair of dogs lying within slots in said cam, parallel to the longest axis of said cam, in opposite ends thereof, a stud secured to each dog, and engaged by said trip-arm, whereby the outer ends of said dogs normally project beyond the periphery of said cam 18, an upwardly and a downwardly projecting peripheral flange on said cam, a cam having antifriction-rollers engaging said flanges, a recess 28 in said trip-arm, and an auxiliary cam 26 adjacent to said recess for pulling each of said dogs inwardly in succession, thereby releasing said cam when either of the antifriction wheels is engaged by said auxiliary cam; a plunger, and tension members between the plunger and said cam; substantially as described.

2. In a baling-press, the combination, with the crank, having a longitudinal groove in its upper face, of a plunger-actuating chain 12, a rod connected thereto, a compression rod, a pivotal connection between said rods, comprising a pair of links, the lower of said links lying in said groove in the crank, roller-plates secured to the crank above said lower link, a cap secured to said plates above the path of said links, a chain 16 connected to the last-named rod, a forked shackle connected to said chain, a cam having an upwardly and a downwardly projecting peripheral flange engaged by the arms of said shackle, a movable projection on said cam for engaging said shackle, and a longitudinal projection secured to the crank at one side the chain 16, for preventing said chain from forming a hook therein when it is released from said cam; substantially as described.

3. In a baling-press, the combination, with the plunger plate or apron 27, of plates 20 secured thereto at their inner periphery and having their outer portions free, to form grooves with said plunger apron or plate, frame-bars 26 having flanges entering said grooves, and transverse bolt passing through said frame-bars for drawing them together into frictional engagement with said grooves; substantially as, and for the purpose, specified.

4. In a baling-press, in combination with angle-bars 20 of the bale-chamber frame, a reversible hopper comprising a hopper, a lip secured thereto for engaging one of said angle-bars, and depending hooks secured to the respective sides of the hopper, for engaging the opposite angle-bar; substantially as described.

699,662. PULLEY ATTACHMENT. LEWIS C. COULDER, Portland, Oreg. Filed Nov. 30, 1900. Serial No. 24,200. (No model.)

Claim.—A shaft provided with a keyway, a grooved pulley on the shaft, a removable and replaceable supplemental flat-faced pulley provided with a recess to receive and cover the grooved portion of the first-named pulley, and a key to engage the keyway and to hold both pulleys on the shaft, substantially as and for the purpose specified.

699,663. BUTTER-DRILLING MACHINE. ALBERT A. GUYER, Dubuque, Iowa. Filed Dec. 20, 1891. Serial No. 64,785. (No model.)

Claim.—1. The combination in a butter-drilling machine, of a series of drills, means for operating the same, a series of bottom-holding checks arranged in sets, supporting-disks therefor, one set of checks being held in operative relation to the drills while the remaining set is in inoperative relation thereto, the checks of operative and inoperative sets being alternately disposed, and means for automatically shifting said checks to present the sets alternately to the drills.

2. The combination in a butter-drilling machine, of a series of drills, means for operating the same, a series of bottom-holding checks arranged in operative and inoperative sets, means for revolving said checks, intermittently-rotatable supports carrying said checks, and means for automatically changing the extent of movement to alternately present the different sets of bottom-holding checks to the drills, substantially as specified.

3. The combination in a butter-drilling machine, of a series of drills, means for operating the same, a plurality of sets of bottom holding checks adapted to operate alternately in connection with said drills, supporting-disks for said checks, means for rotating the disks through a number of equal angular distances to effect the drilling of the butter-blanks held by one set of checks, and means for changing the extent of angular movement of the disks to present the bottom-blanks of the second set of checks to said drills.

4. In a butter-drilling machine, a series of drills, means for operating the same, a series of bottom-holding checks, bottom check-spindles supporting said checks, spindles arranged on each spindle and intermeshing to form a continuous train of gearing, a shaft, disks mounted on said shaft and supporting the series of spindles, means for intermittently rotating said shaft, spur-gears carried by one or more of the spindles, and a stationary gear intermeshing with said spur-gear and adapted to rotate the latter during the relative movement of the shaft and disks.

5. In a butter-drilling machine, a series of drills, means for operating the same, a shaft, a pair of disks secured thereto, check-holding spindles mounted on said disks, a gear carried by each spindle, said gears being arranged in a continuous angular series, auxiliary gears carried by one or more of said spindles, a stationary gear with which said auxiliary gears intermesh, means for intermittently rotating the shaft and disks, check-spindles adapted to said spindles, and means for locking the disks in position after each movement and during the operation of the drills, substantially as specified.
